The
BUILDERS' JOURNAL
AND
ARCHITECTURAL ENGINEER

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING

It is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious art; for the disciplined ranks of a distinguished profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb. . . . .

CAXTON HOUSE, WESTMINSTER

Billiken.

It is the privilege of grandchildren to teach their parents' mothers how to absorb the nutriment of eggs; and it equally falls to the lot of youth, blessed oftentimes with nothing but the consciousness of its own superior worth, to administer salutary lessons in life to those of age and experience. For a whole year or more the United Kingdom has been labouring under a double load of pessimism and depression—a stagnation of business; a great increase in unemployment; a certainty of further taxation; the gathering of war clouds, crowned by the gloomy future which experience always weaves out of these other troubles. Now, if no evil is so great but thinking makes it so, it is clearly time for this nation, great in age, established in tradition and ripe in experience, to be shaken up a little, and some of the self-confidence and buoyancy of the younger peoples added to its qualities. The extraordinary revivification of industry in the United States after one of the worst financial crises in its history, and following the commercial disturbance of a Presidential election, is a striking tribute to the optimism of the American commercial man. In "The Taking of Lungtungpen" Kipling has demonstrated the value, in certain kinds of warfare, of the young and untrained warrior over the old and seasoned soldier. We sit "the-ourising" over the ethics of attack while the American citizen is capturing the town, and his success is attributed by one of our daily contemporaries to the Optimist's League, which was formed during the darkest days of the American financial crisis, and whose members, themselves refusing to believe that all things were for the worst in the worst of all possible worlds, have gradually, but none the less surely, drawn all their fellow-countrymen round to the same point of view. On hundreds and thousands of home and office tables in the United States sits Billiken, the tangible mascot of the optimist operations. The conception of a young girl modeller in an idle moment, reproduced at first only for the amusement of a few friends, he is now run by a limited company, and reproduced by the hundred thousand. Thousands of him are pouring into England to chase away the gloom to provoke a smile for Billiken, the quaint "god of things as they ought to be," is very gentle, and his expansive grin provokes no more than an answering smile; but that answering smile, once produced, can so alter the aspect of a day's work that its close may disclose results that were never visible at its beginning. It needs but nerve and effort to re-establish with us that spirit of healthy optimism that is so fruitful of results over the water. It was our proud boast that we never knew when we were defeated; but if that maxim still holds in warfare it is no longer true of commerce. There is a point when intellect becomes a curse; there is a time when experience develops into a hindrance; let us rather develop new experiences, and give rein to the blind self-confidence of youth. Building has never been in such a bad way! We must then have reached the turning point to something better. Architecture is a lost art! Yet never were the students so keen, never were the facilities of education better; never were the coming men better grounded or of better breeding. Unemployment is rife! Then start to work; Heaven knows it is waiting to be done. There are towns to be built; slums to be cleared; garden cities to be raised. London must one day become a city; it is as yet but a conglomeration of egotistical phantasies. And after London there are Manchester, Liverpool, Birmingham, all waiting for their Baron Haussmanns. Of a truth, we cannot see the wood for the trees. Let the supposed predatory instincts of hen-roost robbing statesmen no longer inhibit enterprise or lock-up capital. Let the Tariff Reformer look to the present year to seal the success of his campaign; let the Free Trader be conscious that 1909 will see the re-establishment of his principles; and let our optimism be reinforced by effort. For optimism may resemble pessimism in this, that it can sit slothfully waiting for something to turn up. Let the architect believe this year will witness his *chef d'œuvre*; and the builder be assured that it will be his most prosperous period. On one class, and one class only, make unending war. Let the sword be drawn upon those men who say the country is old and worked out, that it has reached and passed its zenith, and must inevitably decline. One finds them both in Parliament and out of it, blindly attributing as immutable laws of the universe the operations of sloth and pessimism among the world's inhabitants. It is easy to foster slackness in a generation taught to believe that slackness is but the premonitory symptom of an inevitable decay. It is easier to draw analogies between the slackness which destroyed the Roman and all other empires, and that which afflicts us at this hour, and it is a pastime that has afforded cheap amusement for pessimistic writers in the past. But to-day let us be optimists. We are at the beginning of a new year; we have a clean slate before us. Whether we accomplish much or little, let us accomplish something. Billiken is not needed to help us to be optimistic if we possess the will and the energy, but we may meet him with advantage now and then, as a reminder of what we set out to do. Who, then, will join a British League of Optimists? There are no president, no secretary, no council with warring opinions, no varying grades of membership, no offices, and no dry-as-dust papers to be endured with respectful stoicism. Membership is open to all; and the work, after all, is light. A quiet smile and a blind eye to failure, and to frowns and groans the murmur of one word:—Billiken.

Hope for Rome.

There is hope for Rome. In a previous reference to the wholesale demolition and reconstruction proposed by the municipal authorities, we sought to make it clear that we favoured neither the ultra-engineering nor the ultra-archæological view of the situation, and that we held the citizens to be perfectly justified in regarding Rome as a place to live in rather than as a vast museum of antiquities for strangers and pilgrims to stare at. We regretted that the scheme had been entrusted to an engineer, because it is notorious that in the engineer the bump of veneration does not bulge. He is the incarnation of modernity, and to let him loose on ancient Rome was to cry "Havoc!" We apprehended that such reforms as are necessary might be effected without destroying much that is worth preserving, and that this view is tenable seems to be shown by a report that has been presented by representatives of the various architectural and other artistic societies of Rome. This report is now under consideration by delegates from nine societies, which include the Academy of St. Luke, the Roman Archæological Society, the Society of Architects, and the Society of Italian Architects and Engineers; the delegates comprising most of the best known Roman artists, architects, and archæologists—surely an excellent blend, whereof the elements should be mutually corrective, while the combination should be sufficiently powerful to check any undue tendency towards the mere excess of engineering. The report is said to be very temperate in tone. Nor does it simply protest. It approves and commends the desire for betterment, and formulates an alternative scheme which would secure that object without destroying the more interesting of the buildings that seem to the engineer to obstruct the path of progress. It is now confidently anticipated that this courteous, conciliatory, and altogether dignified remonstrance, supported as it is by the weight of such an array of influential names, will at least mitigate the drastic severity of the engineer's scheme, and will save from indiscriminate destruction those buildings that are best worth preserving.

The Dead Hand in Architecture.

Mr. Leonard Stokes protests against the method of procedure with respect to the proposed additions to the Law Courts in the Strand. He complains that such plans of the proposed work as he has seen "show a colourable imitation of Street's work—in fact, features are borrowed wholesale from different parts of the present building, and collected to form the new wing or block, and it is evidently intended that the new work shall be a sort of réchauffé of Street." This method he regards as a great mistake. If Street were alive, he would not, Mr. Stokes believes, reproduce the work he did some thirty years ago, with all its mistakes. "One would rather imagine that, having learnt by experience, he would make a fresh effort, and evolve something which, though in harmony with the present building, were yet distinct and better, showing that modern Gothic had not stood still for the last quarter of a century." Copying and completing the work of dead men is hardly, Mr. Stokes thinks, one of the legitimate functions of the Office of Works; and he declares that the very endeavour to abide faithfully by the "half-thought-out" details of Brydon's Government buildings in Parliament Street has resulted in the perpetuation by "a department" of mistakes which Brydon would never have made in stone. Any architect, we imagine, who took up the work of a dead man must necessarily find himself in an extremely invidious position; but we suppose Mr. Stokes to imply that "a department" labours under a double disqualification. It is hampered not only by the weight of the dead hand, but also by the fetters of officialdom, whereas an independent architect, judiciously chosen, could assert his individuality with greater freedom. On this point the question assumes considerable delicacy, and it would be difficult to elaborate the argument without wounding the susceptibilities of architects who hold official appointments. Divesting the matter of all personality, and referring merely to the abstract principle, we may perhaps be allowed to say that the issue thus raised intensifies the conviction that we have previously expressed—namely, that the official architect, Government or municipal, should be consultative and advisory rather than executive. As to Mr. Stokes's other point, we are strongly disposed to agree that a building raised to-day, whether or not it is an addition to an existing building, should be invested with the spirit of to-day; as, indeed, willy nilly, it must be to at least some infinitesimal extent, no matter how strict the endeavour to make it a slavish (and incidentally a lifeless) copy of the original. It seems far more candid and courageous, and no whit less reverent, to let the old work influence us in spirit rather than in detail; "for the letter killeth, but the spirit giveth life." In saying this, we are mindful that we have not here a case of "restoration," but that, on the contrary, the proposed addition may be almost regarded as an independent building. We conceive, therefore, that it may rightly assume some degree of individuality of character, and that it may very legitimately make a frank revelation that, while it is closely related to the main fabric, and by no means repudiates the relationship, nor seeks to disguise the family likeness, it has been reared by another hand, and in a later generation.

Legislation for Jack Frost.

Of the making of by-laws there is no end; and much study of them is weariness of the flesh. Far be it from us to advocate an increase in their number; but the recent Arctic weather has very forcibly suggested the necessity of inflicting some restrictions and provisions in the plumbing work of our dwellings, and more especially in our speculatively built dwelling-houses. In one road of our acquaintance over 80 per cent. of the houses had the water supply frozen up, with ghastly results following the thaw; and every severe frost sees the necessary standpipe put up in the road, and the weary trail of the inhabitants to and fro with buckets and jugs. In these houses the main supply pipe is carried up an inner passage wall embedded in the plaster, and has not been known to freeze. It supplies a cistern under the slated roof, and from it the composition supply pipe to the taps, etc., sags gracefully over the ceiling joists till it reaches an outer corner at the back of the house. Here (also imbedded in the plaster) it is carried down on the inside of the wall direct to the kitchen sink on the ground floor, supplying on its way the first floor w.c. and the bath, the last having a branch pipe carried along the whole of the outer wall of the bath-room to the head of the bath. This service pipe is quite away from any chimney flue or ordinary warmth, and, as has been stated, is quite unprotected in the roof. The cost of properly encasing it with felt in wood boxing would be infinitesimal compared with the cost of frequent damage from bursts and the necessary repairs. Yet it is too much to hope, we fear, that a sweet reasonableness will characterise the plumber in arranging the lines of the water supply when working out a piece-work contract on cheap rates; or that the speculator, for whose avaricious shifts the builder is too often blamed, will spend so much money in properly equipping houses which he has no intention of holding if a sweet confiding and investing public will relieve him of the burden. In the direction indicated, some new by-laws might, we think, be fruitful in operation; and they might be substituted for some of those onerous urban restrictions which country districts have madly taken unto themselves under the ægis of the Local Government Board. But the first work of that Board and its energetic President should be to pass such legislation as will enable the rural authorities legally to extricate themselves from toils of their own making.

"Slushfulness."

It is astonishing as the world grows older how the view points of its inhabitants change. In the young days of the present generation the Dickensy Christmas, with its concomitants of snow, warm firesides, roasting chestnuts, ghost stories, mistletoe, and general merriment, was a thing earnestly desired and rarely achieved—principally because the snow, that necessary and indispensable ground colour in the picture, was absent. This Christmas we have had the snow and frost, and also a remarkable ghost story from Norfolk. Written and spoken comment has not, however, extended a welcome to either. We are now so much "a street-bred" people that city dwellers find no place in the scheme of civilisation for either snow or ghost stories. If the latter is too little in evidence the former is too much so. It freezes our marrows, bursts our water-pipes, hampers us in getting about, delays our trains, increases our rates, upsets our constitutions, stops our building operations, and throws out of work more skilled workmen than the unskilled labourers who find a job in helping to get rid of it. And sooner or later it results in that glorious condition of slushfulness, to use Mr. Raphael's word, which has been our portion for the last few weeks. There are few things we can spare so easily, nowadays, "as Nature's fleecy mantle."

A Guild of Assistants.

Anent the various letters which have appeared, and are still appearing, in our columns, advocating the formation of a Guild of Architects' Assistants, we had intended to say a few things in this issue. Criticism, however, must be withheld, for the moment, in view of one or two possible developments which have been suggested to us, and to which we desire to give further consideration. Mr. Dixon's original proposal is not without its merits, and it has evoked a response the country over whch should promise well if the idea comes into the sphere of practical politics. But we hesitate to assist the inception of another architectural body until we are well persuaded that its formation would materially assist a deserving class of young men, and that its powers and status would be sufficient to enable it to fulfil its objects. We are not at liberty, for the present, to disclose certain suggestions that have been, quite tentatively, made to us; but when we have had time to investigate them thoroughly we shall be in a position to make a further statement. Meanwhile, those assistants who desire to join such a guild might communicate with us or with Mr. Dixon, so that it may be known what measure of support is likely to be accorded to the new venture if it should ever be launched.

Red Ruin and a Moral.

The last days of the year have witnessed in Southern Italy one of those terrible catastrophes that periodically befall the hapless peoples who inhabit the geologically youthful portions of the earth's crust. So immense is the disaster, and so widespread the ruin, that it is impossible to comprehend a havoc that destroys whole towns and takes toll of humanity to the extent of 200,000 souls in a few moments of time. But as out of all great evil some good does come, it is to be hoped that the rebuilding of these towns, if rebuilt they are to be, will show some fruits of modern experience in building operations. The lesson of San Francisco has led to the rebuilding of much of Kingstown, Jamaica, in reinforced concrete; and if the newest construction is not proof against the most violent convulsions of the earth, it cannot, like the older forms of construction, be shaken into the original bricks by shocks of moderate severity. Building in earthquake zones must be carried out on lines which experience has shown to give the most probable chances of safety to the inhabitants. The extensive use of reinforced concrete which the Italians have already made leads one to hope that if Messina and Reggio are once more to rise, they will be reinforced concrete cities with comparatively low buildings.

"APPLICATIONS" UNDER THE LONDON BUILDING ACTS.

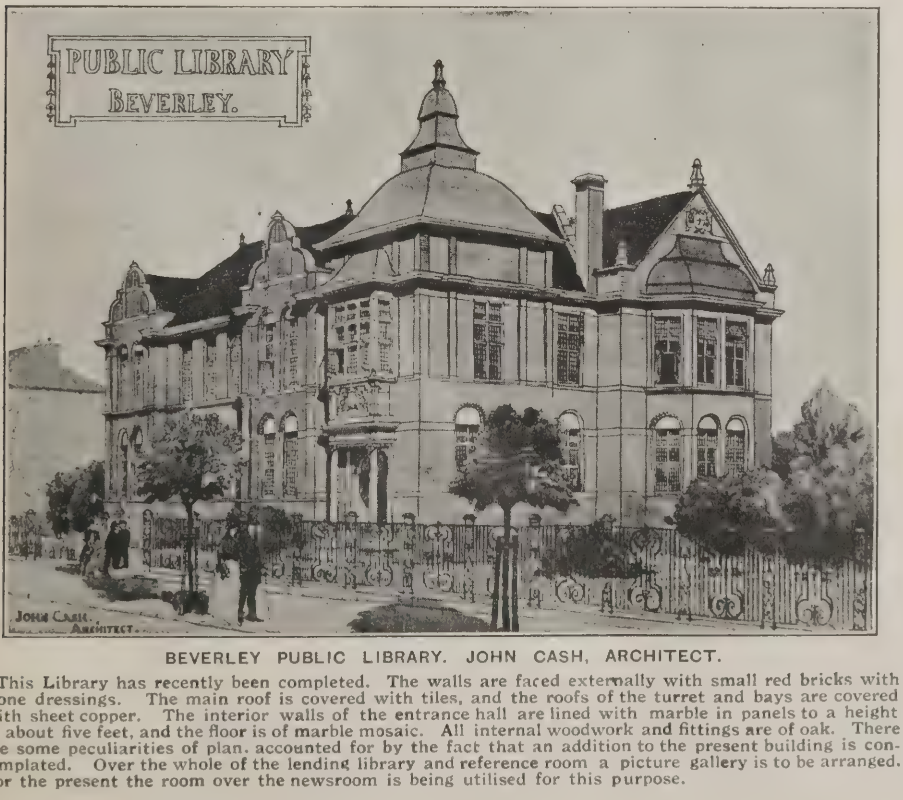
By B. Wyand.

"I would call attention to a most objectionable clause in the Bill—'the Council may permit.' The whole Bill bristles with permissions to avoid every clause in it." Thus wrote the late Professor Banister Fletcher in his book on the London Building Act, 1894. It was the fortune of Professor Fletcher to play several parts in professional life. Rarely are men given the opportunities, or endowed with such versatile talents as to be able to occupy the posts of professor of architecture and district surveyor, and at the same time to carry on a considerable private practice, and to make for themselves a reputation of no mean order in technical literature. The opinions of men are necessarily coloured to some extent by their callings or professions, and in this particular case the late professor wrote rather from the point of view of the district surveyor than from that of the practising architect. Then, again, it must be remembered that the above-quoted words were written shortly after the passing of the Act, and before the effect of the working had been able to be realised. After the lapse of nearly fourteen years there will be found few who will not admit that those provisions of the London Building Act which admit of variations from the strict letter of the law, conditional upon the consent by the County Council, do contribute to a more satisfactory state than would be attained if all the provisions were of an invariable cast-iron pattern. Cases are of frequent occurrence where both private owners and the general public are benefited by the existence of a give-and-take policy rendered possible by the permissive section of the Building Act, although equally, as will be shown later, there are cases where the powers of unconditional refusal possessed by the Council tend to the infliction of an unfair burden upon the property owner and the architect.

Those who have to carry out building work in London will doubtless be interested in the following references to the sections which admit of deviations by consent from the strict letter, and to the methods in which the County Council require applications under these sections to be made. Further, it may be possible, looking at the matter from the standpoint of practising architects, to enunciate what appear to be a few of the main principles governing the issuing of consents or refusals. Individual readers, by also noting their own experience in connection with the success or otherwise of applications, may thus be able to formulate a few rough rules for their own guidance and that of their clients.

A very useful leaflet, reference to which is in most cases necessary in making an application, may be obtained at the offices of the County Council. This contains the regulations, rules, and standing orders as to applications for consents, licences, etc., under the London Building Acts, 1894 and 1898, approved by the Council in November, 1904, in substitution for those previously in force. In this there are given the heads of the sections of the Acts of 1894 and 1898, under which the consent of the Council to variations can be obtained. The drawings required under each particular section are stated, and there is also a reference to the form of application to be observed. All applications must be addressed to the Superintending Architect, County Hall, Spring Gardens, S.W., with the one exception of applications relative to the erection of a dwelling house, or the adapting of buildings to form a dwelling-house on low-lying land. Such an application, made under Part xi. of the Act of 1894, must be addressed to the Clerk of the Council.

All applications are required to be in writing on foolscap paper, and all drawings to be in duplicate, on tracing cloth of a sufficient size to admit of the approval of the Council being endorsed thereon, and are to be drawn on the unglazed side of the tracing cloth. A north point and an actual scale, not merely an indicatory note, must be drawn on every plan. These latter requirements may appear but the elements of geometrical drawing in the eyes of competent draughtsmen, but as there is a possibility of private owners executing their own "drawings," no doubt the announcement of these few rules prevents in some cases their wholesale violation. Possibly, too, those responsible for the drafting of the regulations have already suffered at the hands of the amateur draughtsman. The regulations require a general colour scheme to be adopted. The site must be coloured pink, the proposed building red, existing buildings grey, and blue colour must be used to distinguish any land which may be proposed to be dedicated and left open for the use of the public. Particulars are required as to the nature of the application, the situation and proposed use of the new building, and the nature of the owner's interest—freehold, copyhold, or leasehold—in the property. Such are the official requirements, but it will be to the advantage of an applicant to bear in mind that it is not the slavish following of a set of regulations, but the submission of an application accompanied by clear and definite drawings which will best further the interests of his client. Some architects imbued with a lofty scorn of all restrictions so lost in the contemplation of Art with a big A, as to be unable to obtain a reasonable grip of an Act of Parliament, may, figuratively speaking, sling their applications at the head of the responsible authorities and leave it to the officials to find out exactly what is being applied for. Such applicants often have their reward in the receipt of an official refusal instead of the desired consent, which might have been obtained if a little tact had been shown and the strong points in favour of the application been given due prominence.



BEVERLEY PUBLIC LIBRARY. JOHN CASH, ARCHITECT.

This Library has recently been completed. The walls are faced externally with small red bricks with stone dressings. The main roof is covered with tiles, and the roofs of the turret and bays are covered with sheet copper. The interior walls of the entrance hall are lined with marble in panels to a height of about five feet, and the floor is of marble mosaic. All internal woodwork and fittings are of oak. There are some peculiarities of plan, accounted for by the fact that an addition to the present building is contemplated. Over the whole of the lending library and reference room a picture gallery is to be arranged. For the present the room over the newsroom is being utilised for this purpose.

Care is necessary to be taken both in the drafting of the application and in the preparation of the necessary drawings. In the letter of application the points in favour of the request should be briefly summarised, and it should be recollected that the public authority necessarily have to consider whether any public disadvantage is likely to be occasioned at the present or at any future time. If it can be argued that the proposed variation from the strict legal building rights will make for the public good, this should be stated in the application in no uncertain manner. Then again, most public bodies are influenced considerably by precedent, and thus if it can be shown that Smith or Jones next door, over the road, or in the immediate locality, has actually carried out work on similar lines to that for which permission is required, a useful point in favour of consent is at once made. The positions of such erections or works should, of course, be shown on the drawings. These should be clear and easily understood, and nothing more should be shown than is necessary properly to explain the applicaton. Superfluous matter may make the drawings look "busy," but it will confuse the point at issue, and may cause unnecessary questions to be raised. Such little absences of method, as that of putting the block plan a different way round from the larger scale drawing, should be studiously avoided; the preparation of a drawing to be understood at a glance should be aimed at.

Section 7 of the London Building Act, 1894, states that before any person commences to lay out a street either for carriage traffic or foot traffic an application must be made to the Council for their sanction. Section 10 of the same Act states that the Council's sanction must also be obtained before any person commences to adapt for carriage traffic a street or way not so adapted. or to adapt as a street for foot traffic or as a public foot way any way not previously so adapted. Thus, speaking in broad terms, the consent of the Council is necessary before the carrying out of any roadwork, and in applying for such consent the owner has the option of desiring some of the usual conditions to be waived. In the case of the forming of a new street, plans and sections drawn to the required scales must be submitted; applications made under Section 10 must also be accompanied by plans. Particulars in writing must be given of the control over the land forming the site of the new street possessed by the person on whose behalf the application is made, and the Council may require this to be verified by the production of the title deeds. Those acquainted with the Building Act of 1894 will remember that within two months after the receipt of an application under either of the two above-mentioned sections, the Council must either sanction or approve the application, otherwise they shall be deemed to have given their sanction. This clause is presumably intended to prevent undue delay in issuing a consent, but it is not uncommon for the professional man to receive, a day or two prior to the expiration of the two months, a request for further particulars, accompanied by a formal rejection of the plans.

Sections 9 and 11 contain a list of the cases in which alone the Council may refuse their sanction, and these, in fact, constitute the official requirements. The ordinary requirements of a width of 40 feet for carriage traffic streets is not likely to be desired to be varied, in fact it is hardly likely that any such application would receive much consideration. The limit of width of 20 feet for foot traffic streets and the limit of gradient of 1 in 20 for carriage traffic streets, may in some cases be considered too stringent by the owner. The circumstances of the case are likely to have considerable influence upon the result of an application in which these requirements are desired to be relaxed. Probably the requirement which more seriously affects property owners is that which demands that except in the City a new street must form direct communication between two streets. Crescent roads with but two entrances are thus barred, and it is a matter of considerable doubt whether this requirement is likely to be relaxed in any ordinary case. It is noteworthy that in this part of the Act of 1894 (Part II.) there is the right under Section 19 of appeal to the Tribunal of Appeal. The last-mentioned case in Sections 9 and 11, under which the Council may refuse sanction, is that in which the forming or adapting of a street any by-law of the Council is contravened. The by-law relative to the formation of new streets in the Metropolis made by the Metropolitan Board of Works in 1857 should thus be referred to. It is in many parts reenacted by the Building Act in 1894, but the cross fall of the roadway, height of curb, and slope of footway, are governed by this by-law.

(*To be concluded.*)

Coventry.—Two schemes for a proposed town hall for Coventry have been prepared by the city engineer, and are now under consideration by the town council.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Mar. 17	NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3,500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council. Stanley S,O., Co. Durham.
No date.	*SOUTH BANK - IN - NORMANBY. Town Hall, Council Offices, etc., for the Urban District Council.
No date.	SWINTON. New Schools in Cromwell Road for the Swinton and Pendlebury U.D.C. Limited to Architects having offices within ten miles of Manchester. Premiums of £50,£25, and £10. Instructions may be obtained by letter on or before November 5th, to W.T.Postlethwaite, Council Offices, Swinton, Manchester.
No date.	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days.

**The R.I.B.A. Council has requested Members to refrain from competing.*

Bury Secondary School Competition.

The assessor in this competition, Mr. J. W. Simpson, vice-president and fellow of the Royal Institute of British Architects, has completed his assessment, and the whole of the plans submitted, both premiated and unpremiated, were exhibited at the Technical School, Broad Street, Bury, on Saturday, January 2nd, from 2 to 8 p.m.; and from 10 a.m. to 8 p.m. on Monday and Tuesday, January 4th and 5th, 1909. The premiated designs are as follows:—

First, Mr. T. Thomas Halliday, A.R.I.B.A. of Stockport;

Second, Messrs. Castle and Warren, of London;

Third, Messrs. Appleyard and Quiggan, of Liverpool

There were 141 designs submitted. The premiated designs, with a criticism, will appear in our issue of next week.

* * *

Primitive Methodist Church and Schools, Gateshead.

The result of a limited competition for a new Primitive Methodist Church and Schools, Low Fell, Gateshead, has been made known, and the plans submitted by Messrs. Marshall and Tweedy, 17, Eldon Square, Newcastle, have been selected. The church will accommodate 600, and the school 350; there are nine class rooms and six vestries. The cost will be about £5,000.

* * *

Blackpool Library Competition.

Over 100 sets of drawings have been received for the above. Mr. G. H. Willoughby, of Manchester, is the assessor.

Shakespeare Memorial Committee.—This Committee has been engaged during the autumn in drafting a scheme for a National Theatre, and two sub-committees, one under the chairmanship of Lord Esher and the other under that of Lord Lytton, have been holding weekly meetings. The executive committee consists of the Lord Mayor of London (chairman), Lord Plymouth, Lord Lytton, Lord Esher, the Hon. Mrs. Alfred Lyttelton, Sir John Hare, Mr. William Archer, Mr. H. Granville Barker, Mr. S. H. Butcher, M.P., Mr. J. Comyns Carr, Mr. Sidney Colvin, Mr. W. L. Courtney, Mr. Robert Donald, Dr. F. J. Furnivall, Mrs. G. L. Gomme, Mr. Edmund Gosse, Mr. Sidney Lee, Mr. Sidney Low, Mr. H. W. Massingham, Mr. A. W. Pinero, Mr. J. Forbes Robertson, Mr. G. Bernard Shaw, Mr. H. Beerbohm Tree, Professor I. Gollancz (hon. secretary), and Mr. Philip Carr (secretary).

Our Plate.

House at West Didsbury, near Manchester.

This is a rough-cast house, [illegible] hand-made red sand weathering tiles, with hand-made sand-faced brick quoins. Inside the hall is paved with coloured Italian marbles in large squares. The ceilings of the drawing-room and the hall have dark oak beams, taken from an old cottage recently demolished in the district. A special feature of the sanitary arrangements has been the provision of lavatory basins with hot and cold water supply in every bedroom. The contractors were Messrs. Peace and Norquoy, of Manchester, and the architects are Messrs. Fair and Myer, A.R.I.B.A., of Furnival Street, London.

Obituary.

Mr. William Milner Fawcett, F.R.I.B.A., the Cambridge architect, died somewhat unexpectedly at his residence at Cambridge on Sunday week. He was born near Leeds in 1832, the third son of the Rev. James Fawcett, vicar of Knaresborough, and was educated at Leeds Grammar School and Jesus College, Cambridge. He began practice as an architect at Cambridge in 1859. He obtained his F.R.I.B.A. in 1866, was member of council from 1871 to 1873 and from 1884 to 1889, and was vice-president from 1896 to 1900. He was at one time county surveyor for Cambridgeshire, and diocesan surveyor for the diocese of Ely. He designed the Cavendish Laboratory, additions and alterations to King's, Queens', Emmanuel, Peterhouse, and other colleges, the training college for women at Cambridge, additions to Addenbrooke's Hospital, and several county mansions. He also supervised the building or restoration of about fifty churches. He was a pioneer of the Volunteer movement, and held the V.D.

* * *

Mr. Edward Augustus Gruning, F.R.B.A., who died recently after a few days' illness, had practised as architect and surveyor in the City of London for more than forty years, and had built many banks, insurance offices, and mercantile houses. He was also the architect of De Keyser's Royal Hotel, Blackfriars. Besides being a Fellow and past Vice-President of the R.I.B.A., he was a Fellow of the Surveyors' Institution, and a member of the Tribunal of Appeal under the London Building Acts. He was born on June 26th, 1837.

Correspondence.

Khartoum Cathedral.

To the Editor of THE BUILDERS' JOURNAL.

Sir,—Your somewhat facetious note on Khartoum Cathedral in your issue of December 23rd seems to have been prepared without any knowledge either of the nature of the building or of the local conditions. As a matter of fact, stone is the best natural material available, as there is practically an unlimited supply within 25 miles of the city. The quarries are close to the banks of the White Nile, and the stone is conveyed direct by water to the city. As your mis-statement is bound to create an erroneous impression, I shall be obliged if, only out of common fairness, you will correct it in your next issue.

ROBT. WEIR SCHULTZ.

[We trust that, since the "facetiousness" scarcely touched either the cathedral or its architect, and was mainly aimed at the extremists who are so insistent for the pure "indigenousness" of buildings, the season may afford sufficient excuse for it. Alternatively, we may plead that it has had an excellent effect in drawing this authoritative information from Mr. Weir Schultz, for whose interesting communication we are greatly indebted.—ED.]

Compensation to Workmen.

To the Editor of THE BUILDERS' JOURNAL.

Sir,—The position of the employer under the Workmen's Compensation Act is extremely burdensome. The premiums he has to pay for insurance show a tendency to increase, owing, it is feared, to the unscrupulous way in which workmen take every possible advantage of the Act.

A case in point that has come under my notice may be usefully cited as a warning to employers not to settle claims informally or privately. A man whose claim was thus settled, and who at the time of settlement expressed his satisfaction and gratitude, has now refused to ratify the agreement, and the employer finds that it is necessary for settlements to be filed at Court.

A WELSH BUILDER.

Glamorgan County Hall.

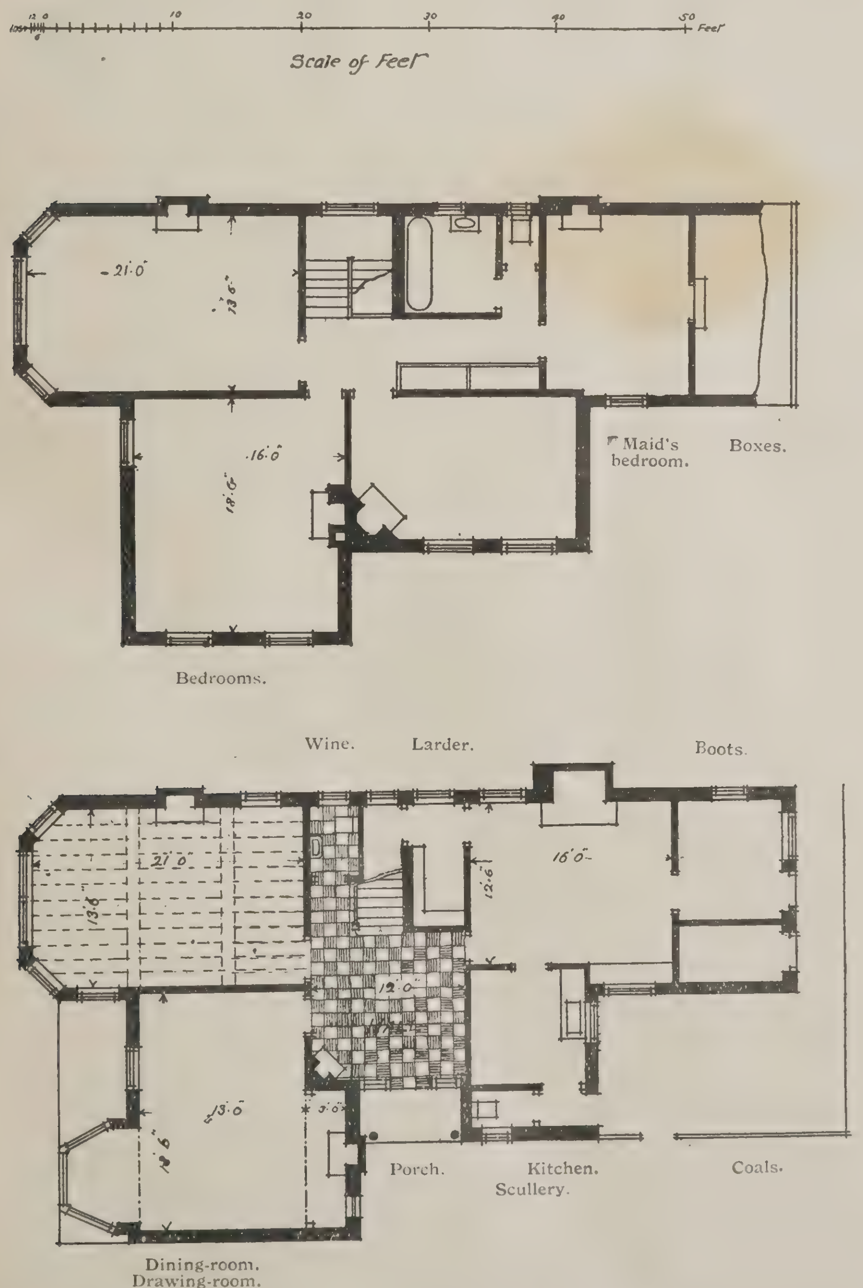
To the Editor of THE BUILDERS' JOURNAL.

Dear Sir,—I have read your report on the above competition, and feel sure that on mature consideration you will see that it is altogether too tame. This was a competition under almost ideal conditions, on one of the finest sites in the British Isles, next door one of the, if not the, finest modern buildings (by modern I mean erected within the last twenty years).

It was perfectly well known that all or nearly all the architects who do municipal work were in for it, and it was hoped that the result might be that the best man would win.

What is the result? A design has been placed first which, if it has any merit, is entirely in the plan. The chief part of the exterior is a Corinthian colonnade, which has no kind of relation to the plan. It might stand a dozen yards in front of the building or it might be left out altogether; it has no relation to the door or window openings, and they have none to it.

Your reviewer says it is all very strictly pure and correct and "rather severe." I doubt if any of it except the columns and entablature, which are, of course, "lifted" out of an order book, is correct. The windows and door openings are far too varied in size, the half-circular ones hopelessly overrun their supporters beneath, and the position of the pedimented windows half-way up the column is, to say the least, uncomfortable.



HOUSE AT DIDSBURY, NEAR MANCHESTER. FAIR AND MYER, A.R.I.B.A., ARCHITECTS.

Compare the details of this front with the measured drawing of the Antico Posta at Vicenza which recently appeared in the "Builders' Journal," or with the fronts of Easton Neston which recently appeared in "Country Life."

The absence of a pedestal or base would be enough alone to damn the design. Try to think what St. Martin's-in-the-Fields Church would look like with all but one of its steps removed. When one sees the building in any way except dead in front, the hollowness and sham of the scheme is at once apparent; the screening order does not return even an appreciable distance, and the front is, as you may say, Queen Anne and the rest Mary Anne.

The pedestals above the attic or parapet will be too heavy when the roof is not seen, as it will not be, and again too thin through; they should return at least as far on the sides as their width on front. The square parapet over projecting wings of front is too deep, and would be better if the base mould went right round, that is, the main faces should not be directly over the line of pilasters, but rather inside them. This would do away with the necessity of the paper-weights above.

This competition, coming on the top of the London County Hall competition, should convince even the most hardened gamblers of the utter futility of competitions as at present conducted.

That the best design has not been placed first, second, or third is a certainty. The competition is simply a gamble in which the competitor also happens to hit the assessor's idea of planning. The man who knows whether the assessor approves of a good lay-out or of the most cramped "economical plan," or what stage of compromise between the two he wants, has the competition won before he starts.

Architecture has nothing to do with the award. An assistant who has been employed in the petty details of municipal planning, such as how far the sanitary arrangements should be from the council chamber, or how many things that have not been specified in the original conditions are likely to be wanted, has a thousand to one better chance than Palladio or Wren himself would have in such a competition.

Finally, let me appeal to the architects or to the County of Glamorgan, or whoever is responsible for the erection of the building, not to erect it as it is at present designed, but to inquire into the available examples of classic architecture, especially those in Dublin, Paris, Vicenza, or whereever else they are to be found, and particularly to compare their cornice heights and levels with the neighbouring building; and if, as seems likely, it is impossible to put steps, to turn their columns into pilasters and put a pedestal base to them.

I have purposely refrained from being sarcastic or funny at the expense of architects with whose previous works I am unacquainted, and who, from all internal evidence there is in the design, may be beginners. There is a greater matter at stake, that is, that almost the only fine new building in the country shall not be spoiled by an unsuitable and even unscholarly neighbour.

NOT A COMPETITOR.

The Proposed Guild of Architects' Assistants.

SIR,—The corresondence in a previous issue in relation to this matter contains a few observations which I believe to be in error and to need elucidation. Your correspondent "Architect" begins by admitting the truth of the principal contentions in my article of December 2nd, and then proceeds to damn the suggestion of a Guild by reference to the ability of the Architectural Association to undertake the work; a reference to "quasi-tradeunion methods," and a warning to all having insufficient connection and capital not to enter the profession. I trust the reference to "quasi-trade-union methods" will not deter anyone from coming forward to support the formation of a Guild. All the questions to be considered by a Guild, and any measures taken to alleviate the lot of its members, would naturally be analogous to those taken by the mediæval organisations. I can only regard the reference to "quasi-trade-union methods" as either unfortunate or unfair to the matter at issue.

The Architectural Association is definitely engaged in the work of education, and whatever else is done by it must in the nature of things be mere by-play. It is formed principally of those who are actually in practice, or have a practice in view, or who are still in the grip of the delusion that a practice is *sure* to come if you look for it. It cannot, therefore, be deeply interested in the questions that a Guild formed for the purpose can alone adequately consider. In addition to this, we have the natural difficulty of adapting any existing organisation for the consideration of ideas quite foreign to its *raison d'être*. Prejudices exist in various quarters of the profession against each or all of the present institutions. I infer from these facts the necessity for a new organisation, a Guild, in which the various existing societies are properly and officially represented, together with all other professional interests, for the consideration and settlement of the new problems which are arising in consequence of the gradual isolation of the interests of the assistant from those of the principal.

"Architect's" warning to those of insufficient capital and connection not to enter the profession is echoed by every profession and business carried on at the present day. We have also the grave difficulty of finding employment at all. Under the present conditions, therefore, such a warning is sure to fall on deaf ears.

The insistance of the maintenance of the existing ratio between the fees of the principal and the salary of the assistant must be met by the consideration as to whether the assistant is justified in making any demand for decreasing that ratio—whether it should be, say, 3½ to 1, instead of about 4 to 1, to put the case very mildly. The inclusion of sympathetic principals in the Guild means the inclusion of those whose first thought is architecture and the well being of the assistant, and profit afterwards. These are the men we must have to help us, and I feel quite certain that such assistance will be readily given.

The dismal outlook of the middle-aged applies equally to other businesses and professions among the salaried or wage-earning class, and the prospect of employment is exceedingly remote, but we cannot help being middle-aged, and we must do something to ameliorate the condition of the middle-aged, and the only manner of doing so is by combination.

It is quite as painful to assistants to see really capable men working at a salary of 30s. or two guineas per week as it is to all members of the profession to hear of principals touting for work and undercutting their colleagues in the matter of fees.

I have a scheme for the flotation of such a Guild as I have described in my article on the subject, and I have heard a great deal of talk, but found it very difficult to bring together, voluntarily, a sufficient number to hold a conference on the matter. I believe now that I have succeeded. I am not aware that "Assistant" (whose letter I am pleased to see) has replied to my invitation of October last in this journal.

I should be pleased to hear from him, and from any others interested, including "Architect," as I propose holding a meeting next month to consider the question of the formation of a Guild and a scheme of unemployed insurance. The Council of the Architectural Association and a few well-known architects have expressed their sympathy to me in the matter of a system of unemployed insurance, and that matter, I am certain, not only involves a Guild, but can only be satisfactorily dealt with by means of it.

The formation of a Guild necessitates advertisement, and our enthusiastic friend "Assistant" has detailed such a procedure, but at the same time much local information must be obtained from those willing to act as local agents of the movement, and also to ensure our advertisement being placed in the best quarters.

E. J. DIXON, A.R.I.B.A.
60, Idmiston Road, Stratford, E.

To the Editor of THE BUILDERS' JOURNAL.

Sir,—I have read with considerable interest the letter by Mr. Dixon in your issue of December 2nd, and also the letter signed "Assistant," in your issue of December 16th.

The latter was especially interesting, putting forward, as it did, what, to my mind, were very practical and sensible suggestions.

The formation of a Guild seems to be an excellent way of carrying this into effect. As has been very truly pointed out, the assistants' interests are not diametrically opposed to those of the principals, although in a good many ways they are not exactly identical. A Guild run by architectural assistants would be of great benefit to assistants where their interests clash with the principals', as in the matter of salary, for instance; but it would also, by inviting the co-operation of the principals, be of great benefit to the profession generally.

History proves that combination is strength. The profession of architecture suffers under many disabilities compared to other learned professions. For instance, there is no such thing as a University degree for architects, as there is for barristers, medical men, literary men, schoolmasters, etc. I think there ought to be, and no man ought to be allowed to practise unless he has got it. This would weed out the incompetent and uneducated, and leave more room for those who are properly fitted and trained for the profession. There is no doubt that the profession is overcrowded, and some such weeding out process is necessary for its welfare and for the furthering of its ideals.

As an assistant, I am naturally, at present, most interested in the welfare of assistants, and, as such, heartily concur with the proposals of "Assistant" as to the preliminary steps towards the formation of the Guild. I should be much pleased to join the proposed committee, and will readily volunteer to contribute a few shillings towards the preliminary expenses.

As to the appointment of a secretary pro tem., I propose that anyone who is willing to undertake the duties should volunteer to do so. A choice could then be made by those who are interested, from among the volunteers. Without wishing in any way to push myself forward, I should be willing to act in that capacity were I selected.

Of course, when the Guild gets into working order, a paid secretary will be necessary who will devote all his time to the work.

In conclusion, I wish to congratulate Mr. Dixon on having brought this subject into such prominence, and "Assistant" for his valuable suggestions, and trust that this movement will soon result in the establishment of a useful and powerful institution.

LAURENCE A. JARVIS.

Notes and News.

We are informed that His Majesty the King has been graciously pleased to accept a copy of Mr. Geo. P. Bankart's new book entitled "The Art of the Plasterer," which has been recently published by Mr. B. T. Batsford, price 25s. net.

* * *

The Royal Commission on Coast Erosion have finished the special report which the Government asked them to make on the possible value of afforestation in helping to solve the problem of unemployment. The conclusion unanimously arrived at is that extensive works of afforestation would be to the public interest, both as a safeguard against the threatened paper famine, and as a means of finding useful employment for many persons. The Commissioners do not consider, however, that any great and speedy relief of distress would be obtained from this source. Operations could only be developed gradually, and even after many years would not engage the energies of more than 18,000 men. This, indeed, would be the result of the development at the rate of 150,000 acres per annum of the nine millions of acres deemed suitable for afforestation in the United Kingdom. Work would probably be undertaken on a smaller scale.

* * *

Mr. John Greenwood, of Overstrand, Mansfield, retired builder and contractor, who died on September 26th last, left estate of the gross value of £31,430, and among his numerous bequests he left six houses in Chaucer Street, Mansfield, to his sons, as trustees, upon trust for use as almshouses for the benefit of deserving aged or infirm persons, in Mansfield, connected with the building trade. The trustees have power to make a small charge to the inmates to cover the expenses of maintenance of the buildings, etc.

* * *

December 22nd was the closing date for tenders for the construction of the naval base at Rosyth. Tenders were invited for enclosed docks, quays, and sea wall, and twenty firms responded, four being from Glasgow. The computed cost is between three and four millions sterling. Work will begin in February.

* * *

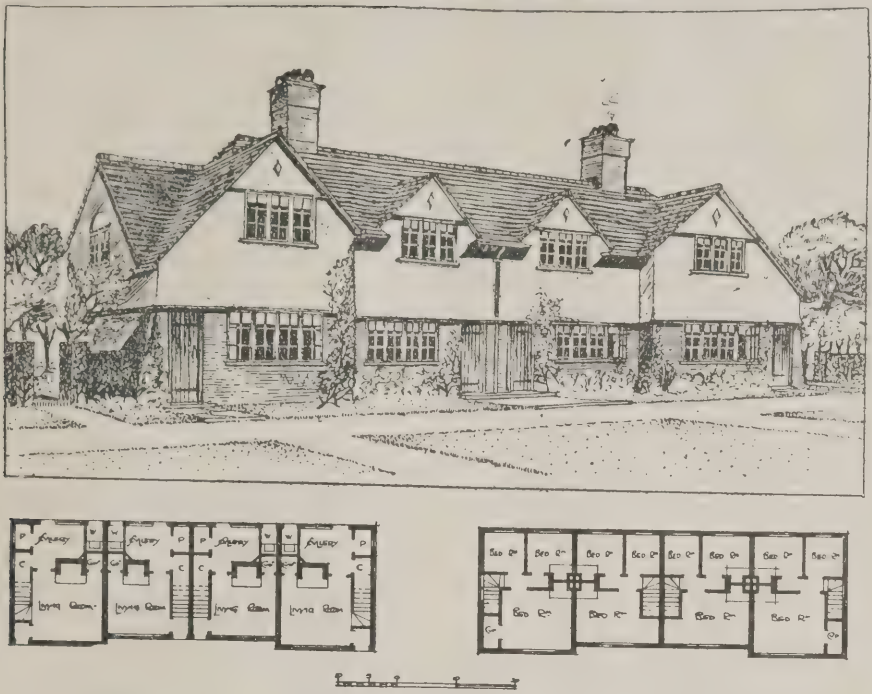
Mr. Birnie Rhind, R.S.A., Edinburgh, has been commissioned to produce a memorial in Melbourne to the late Marquis of Linlithgow, who was the first Governor-General of the Commonwealth of Australia. The memorial is to consist of a bronze statue, and is to occupy a conspicuous position in front of the Government Buildings. It will show the marquis in his uniform, and on horseback. Mr. Rhind executed the statue in Adelaide of the founder of that city, Colonel Light.

* * *

A memorial to the late Dr. Richard Lewis, bishop of Llandaff, which has been recently unveiled in Llandaff Cathedral, by Lord Tredegar, consists of a life-size figure in bright bronze, representing the late bishop in the act of benediction. Mr. W. Goscombe John, A.R.A., who executed the monument to Dean Vaughan in the same cathedral, is the sculptor.

* * *

Simplex Conduits, Ltd., whose head office and works are at Garrison Lane, Birmingham, and whose London showrooms and stores are at 113-117, Charing Cross Road, W.C., have issued a handsome leather-bound pocket diary in hich a brief price list of their conduits and fittings, wires and cables, electrical accessories, etc., is included as unobtrusively as, and, in the special circumstances, much more usefully than, the information that is found in an ordinary diary. The value of the diary to the professional man is greatly enhanced by the ruling in squares. The diary represents an excellent idea, tastefully embodied.



DESIGN FOR A ROW OF COTTAGES. T. G. SMITH, ARCHITECT.

Law Case.

Plasterers' Union Case on Appeal.

In the Court of Appeal, on December 21st, judgment was delivered by Lords Justices Vaughan Williams, Buckley, and Kennedy, in the case of Smithies v. The National Association of Operative Plasterers and others, which was an application by the plaintiff for judgment or a new trial in a case that had been tried by the Lord Chief Justice. The plaintiff, William Smithies, master plasterer, of Birmingham, had sued the National Association of Operative Plasterers; Michael Deler (now dead), general secretary of the Association; H. Duckett, secretary of the Birmingham branch; Stephen Wall, John Ponsford, and John Dear, trustees of the Association; and J. W. Forrester and W. H. Ecclesby, skilled plasterers and scagliola workers; claiming from all the defendants, except the two last named, damages for unlawfully and maliciously inducing and compelling workmen in the employment of the plaintiff to break their contracts and cease work. Forrester and Ecclesby were under contract for a term of years, and against these damages were claimed for breach of agreement. Defendants denied the allegations, pleading alternatively that the Association was not responsible, and that the plaintiff ended the contracts by employing a foreman named James Gibbs, who was obnoxious to the Association, and by refusing to refer his case to the conciliation board.

Plaintiff's claim for damages was made on the ground that on January 17th, 1905, nine or ten members of the union were called out to the detriment of his business. It appeared that Gibbs had been expelled from the Union before he was engaged by Smithies, who was not then aware that there had been any trouble. Soon after his engagement, however, the secretary of the Birmingham branch informed Smithies that Gibbs was a non-unionist. Eventually, as Gibbs was still kept on, the unionists were called out. The Lord Chief Justice awarded plaintiff £25 damages against each of the defendants Forrester and Ecclesby, who had broken their contracts, but held that damages could not be recovered from the Association.

In the present appeal from that judgment, Mr. Lush, K.C., and Mr. McCardie appeared for plaintiff; Mr. Simon, K.C., and Mr. Clement Edwards for the Association; and Mr. Shearman, K.C., and Mr. E. E. Wild for Duckett.

Mr. Lush submitted that, even if plaintiff had, as had been alleged, shown any intention of not abiding by the agreement, to which he was a signatory, between the employers and the union, that could not be a just cause for the union procuring the workmen to break their individual contracts with him; that plaintiff was no party to any alleged breach of the agreement; that the union were responsible for what the branch did in calling the men out, although the union may have had no such knowledge as the branch had with respect to the agreements—the knowledge of the branch must be imputed to the union; and that the union adopted what the branch had done, and kept the men out in breach of their contract. Mr. Lush contended that although the Lord Chief Justice had found that the union were justified in their action, no such justification had been made out. What was justification depended upon the circumstances of the particular case. The branch was a mandatory of the union, and the union therefore became responsible for the acts of the branch. The knowledge of the agent was the knowledge of the principal.

Mr. J. A. Simon contended that the object of a strike was not to procure breaches of contract, but to advise members of a trade union to cease work on giving proper notices. In the present case, the calling out of the men was not actionable, unless it could be shown that there had been some conspiracy on the part of the defendants. But, even if defendants did induce a breach of contract, justification of such an act was quite possible in law. Conspiring to bring about a cessation of work was not actionable unless the object was to injure somebody. The object of the defendants was not to bring about the dismissal of Gibbs, or to punish Gibbs in any way, but to enforce an arbitration clause, to bring about a conciliation meeting to determine whether Gibbs ought or ought not to be dismissed. The men who were induced to cease work were men who were entitled to the benefit of a bargain by which the plaintiff had agreed to raise no objection if they refused to work with defaulters. As to the charge of procuring breaches of contract, it was clear that when men were called out, the union knew nothing about the contracts for terms of years into which Forrester and Ecclesby had entered. The only evidence of ratification by the union of the action of the branch was the payment of strike money, and following the decision of the House of Lords in the Denaby and Cadeby miners' case, this was no ratification. Finally, the fact that plaintiff had failed to carry out the agreement to promote conciliation was justification for procuring breaches of contract.

Mr. Lush, in reply, admitted that the mere payment of strike money would not amount to ratification, but he contended that if the central body supported the action of the branch with knowledge of the facts, and showed their support by sanctioning strike pay, then they must be held to have ratified it.

Lord Justice Vaughan Williams, in delivering judgment, said that while the House of Lords had held that the branch officials were not, as such, officers or agents of the central body, yet, in his opinion, that decision in no way exonerates the central body from responsibility if the central body orders or authorises the branch officials to withdraw men wrongfully from their employment. He thought that the defendant union assisted in supporting the Birmingham branch in encouraging the scagliola men to stay away, although the union knew that this would be a breach of contract. He did not think that the honest belief that plaintiff was acting contrary to the masters' agreement would justify either the action of the Birmingham branch or the ratification by the union, if the union had knowledge of the term of the engagements of Forrester and Ecclesby. "It was urged before us," he continued, "that the judgment of Lord Collins is an authority for the proposition that you can excuse procuring a man to break his contract; and it was said that occasionally the court or a judge restrained a man from performing his contract. But, as Mr. Lush points out, these injunctions only go to restrain a contract which ought never to have been made. As to the knowledge of the defendant association on the day on which the men were called out, I have some doubt as to whether, for this purpose, the knowledge of the branch was the knowledge of the defendant association. . . I have to consider whether the fact that the branch was asking the union to sanction the strike, either makes the union and the branch stand in the relation of principal and agent, or in such relation that the duty to communicate would justify the imputation of the knowledge of the branch as the knowledge of the defendant association. I have grave doubts as to this. It is quite clear that the relation is not that of principal and agent. The case seems to be that, two bodies having a common object, the one engages with the other that he will not take a course which will in all probability throw an obligation to make money payments for maintenance on the other body, without the sanction of that other body. It is, of course, plain that the body asking for the sanction is bound to make full disclosure of all material facts, especially in a case in which the course for which sanction is asked is a course which, if taken without sufficient cause, may damage third persons, and possibly throw liabilities on both the body asking the sanction and the body giving its sanction. But the general position that, where a person asks sanction and it is given, the person giving it must have imputed to him all the knowledge of the petitioner seems too wide. Hitherto, I have only dealt with the case against the defendants other than Duckett. The case against Duckett depends on his knowledge of the scagliola contracts. He says that he did not know of these contracts, and the Lord Chief Justice has found that until January 17th he did not know. I do not see my way to differ from the Lord Chief Justice, who saw and heard the witness as to this question of fact.

Lord Justice Buckley read a judgment in which he arrived at the same conclusion, except that he was of opinion that the plaintiff was entitled to succeed not only against the defendant association but against Duckett as well.

Lord Justice Kennedy read a judgment agreeing with Lord Justice Vaughan Williams.

The appeal was allowed.

A discussion as to the form of the order followed.

Mr. Simon, K.C., said that although the defendants had contended that the damages, if any, could not exceed 40s., to save the expense of a new trial he would consent to judgment, with costs there and below, against the association, with £50 damages.

Mr. Duckett to have his costs paid by the plaintiff.

It was finally agreed that if the £50 was paid into court, and an appeal to the House of Lords set down within a month, the costs should remain untaxed until the decision was given by the final tribunal.

Views and Reviews.

Modern Scottish Domestic Architecture.*

We must confess to a feeling of disappointment with regard to the examples of domestic architecture shown in this book. No doubt they have been well chosen, as the architects whose works are represented are all men of high repute; and it is with the general effect rather than with particular examples that dissatisfaction arises. The book is no doubt faithful to fact in representing, in the net effect, Scottish architecture as being dour, dignified, and rather depressing. The editor, Mr. James Nicoll, remarks, in his very pithy introduction, that until recently "the house of the successful merchant bore a look of stodgy respectability." We thank Mr. Nicoll for teaching us that word. We fear that it could be applied without violent injustice to a large number of the the houses shown in the book. That, of course, is the fault of the cult, and not of the collector. One of Mr. Nicoll's remarks will give the enemy occasion to blaspheme. Commenting on the former general use of grey or brown stone and blue or purple slates, he adds the apology: "In fairness, however, it should be stated that, in the more northern districts at least, certain materials which had to be imported were not available, on account of the cost of transport. Fortunately this state of matters is fast disappearing, and in nearly every part of the country evidence of a feeling for design and good taste and an eye for colour in the selection of materials is noticeable." Surely this is to rejoice over conditions that, during the past summer, have caused weeping and wailing and gnashing of teeth among those to whom, architecturally, importation is vexation. But Mr. Nicoll is quite cognisant of the dangers of incongruity and promiscuousness. "Danger lies," he admits, "in the striving after originality at the expense of restraint and good design; while the builder who, lacking the necessary knowledge and discrimination, calmly lifts and combines in the most incongruous fashion what he considers the best 'bits' of other people's work, is still with us. He steps in where the ordinary architect almost fears to tread, and it matters not what his clients want—slates or tiles, half timber work, roughcast or massive masonry—he will provide them separately or together in the most obliging manner till many an 'eligible' building estate looks like an enlarged experiment in kindergarten. To such a man the qualities of breadth, mass, and repose are unknown quantities; and now that he has caught the trick—an offspring of *l'art nouveau*—of putting something 'quaint' and original into each house, we are in the way of receiving surprises." Mr. Nicoll, however, makes a very reasonable defence of the importation of materials. "In counties," he says, "where some particular production is obviously the readiest building material, it would be ridiculous to use an imported one, but it may be necessary and desirable to apply other materials along with it that may not be obtainable locally or even nationally. The granite district of North-East Scotland is a case in point. Granite, though most appropriate and beautiful in the case of a massive public building, is hard and unsatisfying as usually applied to ordinary domestic work, unless it is combined with some more or less 'foreign' substance. Used with green Westmorland slates or with red or brown Midland tiles, for instance, it acquires an added brilliance that would at first seem impossible." This contention should satisfy all but the extremists. Indeed, the introduction is wholly admirable, and constitutes an excellent *apologia* for Scottish architecture, and includes an interesting, not to say instructive, comparison between the respective methods and practices of North and South, as modified by the differences of habit, of climate, and of tradition. About thirty architects or firms are represented, and there are sixty-six plates of designs. The book, which is well produced and of very moderate price, will probably gain value by the lapse of time, because it happens to have caught Scottish domestic architecture as it were in the very act of transition, at the moment when it had to a great extent cast off the old traditions, but had not yet acquired any very definite new character. The value and interest of the book would have been considerably increased if it had been possible to give, in each case, the date of erection. We suggest also that the word "Modern" would have made the title more explicit.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

The querist's name and address must always be given, not necessarily for publication.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Crushing and Safe Loads on Reinforced Concrete Beams.

BURTON-ON-TRENT. — F.L. writes: "Will you be good enough to give me the crushing and safe loads per square inch on columns and beams in reinforced concrete work? Mixture:—4 gravel, 2 sand, 1 Portland cement; the ages of the concrete to be 1, 2, 3, 4, 5, 6, and 12 months."

The enquiry is too wide for us to answer in detail, for the crushing and safe loads on columns and beams in reinforced concrete work depend upon the size and proportion of reinforcement. If our correspondent wishes to study the subject of reinforced concrete design, we recommend him to obtain Messrs. Marsh and Dunn's book entitled "Reinforced Concrete" (31s. 6d.). A cheaper book is that of Mr. Twelvetrees, entitled "Concrete-Steel." There is also a brief summary of the subject in "Specification." If our correspondent studies enough of the subject to understand how to use the tables provided in Messrs. Marsh and Dunn's "Manual of Reinforced Concrete," price 7s. 6d., he will find ready means of ascertaining the information that he asks for, but we cannot provide him with this information in a form suitable for use by those unfamiliar with the subject. If he proposes using reinforced concrete in any building he designs, we recommend him to place the matter in the hands of a consulting engineer, or one of the specialist firms.

Draughtsmen's Sick Benefit Society.

PERTH.—A CONSTANT READER writes: (1) Is there any benefit society for draughtsmen, where by the payment of a sum weekly or monthly a person receives aliment during suckness? (2) If so, what are the addresses of same?"

We do not know of any benefit society specially formed for architects' assistants. Our correspondent may have noticed with the last few issues particulars of a project for a Guild of Architects which has this object mentioned among others in its purview. It would be quite possible, however, to obtain the benefits he mentions from any of the recognised societies, or sickness and accident insurance companies.

Works in Progress.

Barry.—The new accident hospital, which has been built at a cost of more than £6,600, contains twenty-one beds. The chief contractor is Mr. D. W. Davies, of Barry and Cardiff, and the design was prepared by Mr. J. C. Pardon, surveyor and architect to the corporation.

Bridlington.—The Local Government Board has sanctioned an expenditure of about £11,000 for the improvement of the water system and waterworks. For the necessary building work, the tender of Mr. F. Kneeshaw, of Bridlington (£2,505 17s. 9d.), has been recommended for acceptance.

Cardiff.—Plans for the proposed new St. John's Schools have been submitted to the Corporation. The demolition of the old schools will permit of a considerable street improvement.

Killingholme.—The church of St. Denys here is being repaired at a cost of about £400. The inside walls are being cleared of the old plaster, and the stonework will be pointed up to match that of the restored chancel. The roof of the nave is to be stripped, and a stained pitch-pine roof substituted. The work is in the hands of Messrs. G. Vickers and Co.

Oxford.—The foundations of the laboratory which is being given to the University of Oxford for electrical work by the Drapers' Company are now being constructed. The laboratory will measure about 104ft. by 92ft. by 51ft. high, and will be built of red brick and stone. It will be situated in the parks, close to the other buildings devoted to science, which are grouped around the museum. The ground floor will contain a class-room 50ft. by 27ft., a workshop of about the same dimensions, as well as research, battery, and dark rooms. On the first floor provision is made for a lecture-hall 36ft. square and two class-rooms over 50ft. long, while on the second floor there will be a class-room about 100ft. long, besides large lecture and research rooms. The building has been designed by Mr. T. G. Jackson, R.A.

Southport.—The scheme for street-widening in Lord Street seems likely to materialise. The portion of Christ Church churchyard which the corporation are endeavouring to acquire with this object, is now offered at £4 per square yard, the total cost being about £1,320.

Streetly.—The foundation stone has just been laid of All Saints' Church, which is to be built of brick, and will accommodate 500 people when complete, but only the south aisle, chapel, and baptistry are to be built at first, giving accommodation for about 200. The work is being carried out by Mr. W. Wistance, of Walsall, from the design of Mr. F. T. Beck, of Wolverhampton.

Swansea. — The Corporation have entered into contracts for the erection of 140 double and single tenements on the Baptist Well Estate. It is proposed that the corporation shall build twelve houses on Town Hill in connection with the forthcoming housing exhibition. Also a site for fifteen cottages is being acquired at Plasmarl; and there is a suggestion for another municipal building scheme on Trewyddfa Common.

Wrabness.—The parish church of Wrabness has just been re-opened after alterations and rebuilding that have cost about £1,000. An unsightly west gallery has been removed, the nave has been extended about 14 ft. westwards, and the fifteenth century roof has been in part reconstructed. A mean brick structure that stood on the site of the original fifteenth-century south porch, and served as a vestry, has been demolished, and the old south doorway has been opened out to its original dimensions, and restored to its original purpose as the main entrance to the church. A new vestry has been erected on the north side of the nave, and is approached through an original Norman doorway, which had been for many years disused. The nave has been re-floored with wood blocks, and the old box pews have been removed, open benches and chairs being substituted. The building works have been executed by Messrs. Sage and Cutting, of Wix, from the design and under the superintendence of Mr. W. J. Charles Bourne, of London.

Worthing.—The new public library here, the gift of Mr. Andrew Carnegie, and the new Museum and Art Gallery, adjoining, which have been presented to the town by an anonymous donor, have just been formally opened. The architect is Mr. H. A. Crouch, A.R.I.B.A.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

THE CONCRETE INSTITUTE.

Discussion on Mr. Dunn's Paper.

The following discussion ensued after Mr. Dunn's paper, at the second meeting, already reported in our issue of December 23rd.

Professor BERESFORD PITE, F.R.I.B.A., at the request of the Chairman, opened the discussion upon Mr. Dunn's paper. He must, he said, confess to not being a contractor, and therefore the practical suggestions which might be added to the discussion he was unable to make. He could only confess to a very great interest in the subject and to a keen appreciation of the practical nature of the paper which they had just heard read. That Mr. Dunn had been able to speak with considerable experience of the subject was recognised by all architects, and if one thing was wanted more than another it was not only contractors and foremen of experience, and clerks of works of experience, but architects and engineers of experience. He could not pretend to offer any suggestion of any value to the discussion, except perhaps the formal one of proposing a most cordial vote of thanks to Mr. Dunn on behalf of the meeting for his paper, but he would suggest to architects that the title of his paper was not exhaustive by any means. The examination of designs for ferro-concrete buildings suggested a great deal more to architects than the question of infiltration of sulphates through exterior conduits of similar construction, and questions as to the conduct of clerks of works and others. The designs that would have to be examined for ferro-concrete buildings presented, of course, a variety of topics, and he felt the very great importance of bestowing on the word "design" in connection with ferro-concrete some very special consideration. As one looked around in the history of the building arts, one noticed that there were periodical epochs when some providence of creation moved the builder with the building instinct. One of the most interesting things to note was that at the moment of the advent of a complete grasp of the properties of arched construction, the whole surface of design changed. The Pantheon at Rome, a masterpiece of engineering, as well as of architecture, seemed to be the product of some movement of the building instinct, and for the next 500 years the world was doming. It was not ferro-concrete, but arched construction in concrete fortified with brick. It held the Eastern world in a way which they had scarcely measured up to the present, and this method was left alone for a succeeding period of 500 years, when the Northern energy concerned itself with vaulting by light material strengthened with ribs of stone work, and during those five centuries developed in England, from St. John's at the Tower of London, where the vaulting was of the simplest description, to the vaulting of Henry VIII.'s Chapel, where they got the stone ribs fortifying the vaulting, to an extent which he suggested was not unlike the extent to which steel ribs fortified fero-concrete construction in their view at the present day. From the period of Henry VIII.'s Chapel until now no movement of this instinct had occurred. Iron had been introduced into our buildings to do the work of wood girders and brick and stone piers in a simpler, more economical, and probably more adaptable manner, but no revolution of the building art had ensued. He suggested to this Institute and meeting that the subject of ferro-concrete had brought them to such another crucial epoch, and that they were dealing with the verge of a revolution in building art similar to that which ensued in the East upon the advent of Roman concrete fortified with brick, and the mediæval methods of vaulting fortified with ribs. It was from that aspect, and from the aspect of an outsider, that he ventured to remark on the special interest of this question at the present time. Design in ferro-concrete was not altogether the complete novelty that it might suggest itself to be to the architect. It had means of expression in it, and there was as much force and virility to be expressed by the thin wall as strength and solidity to be expressed in the thick; and he would like to suggest that not only the Science Committee, but the Art Committee, might well give attention to the subject under the title of Mr. Dunn's paper. He had much pleasure in venturing to propose a vote of thanks to Mr. Dunn.

Tendering on Specialists' Designs.

Mr. R. W. VAWDREY said there was one point in Mr. Dunn's paper to which he should like to give special prominence. He said somewhere that he considered that the plan of inviting competitive tenders upon the designs of one or more firms had much to recommend it. It appeared to him that it was wise to avoid if possible the confusion of the design and the price when asking for competitive tenders. The matter was no doubt extremely difficult, and he was not prepared to suggest any exact remedy for it, but it did appear to him to be much better, when an engineer or architect was considering the construction of a reinforced concrete building, if in the first place he would settle his design; that was to say, that he would invite competitive tenders if he desired to do so from those who laid themselves out to prepare them—the specialist firms—and, having settled his design, obtain tenders from the contractors upon it. It appeared to him to be an extremely dangerous thing for the design, and the price at which that design could be carried out to be confused in the selection of the final tender. For instance, where competitive architectural designs were required for some public buildings, it was after the acceptance of the chosen design that tenders were asked for for its construction. Yet the most usual practice of the present day with regard to reinforced concrete work was to ask for competitive tenders upon competitive designs at the same time; i.e., a large number of firms might be tendering for the construction of a building or a bridge on different designs, and he considered that it was a most dangerous proceeding. There was another point, and that was the use of the word "system," which appeared to be continually cropping up. Was it not a mistake for so many firms to use the word "system" of designing reinforced concrete? It appeared to him that it was impossible to override the ordinary principles of mechanics in any reinforced concrete design, and the difference which might occur when designs were prepared by different firms of architects or engineers depended entirely on whether good practice or bad practice was shown in their designs. There was no difference in system; the designs were not prepared on different systems. All correct designs depended on the principles of ordinary mechanics, which could not be ignored. He must express his regret that Mr. Dunn should have stated that in this country a mishap would not be dealt with scientifically and investigated, the regret being the more sincere because it was probably true. Surely this Institute had been promoted to some extent for dealing with these questions scientifically, and he would suggest that, in any case of failure, if possible, a committee or some portion of the Institute should be appointed to investigate, if necessary more or less privately, into any important case of failure which occurred.

The Rules of the British Committee.

Mr. G. C. WORKMAN said that, as the representative of one of the oldest firms of specialists, he wished to thank Mr. Dunn for his paper. It was quite evident that at present there was a great tendency to specialise in all branches of science and industry, and he therefore thought Mr. Dunn was quite right in saying that both efficiency and economy were better served by consulting a specialist when a reliable scheme was required for work in concrete. Concerning the question of the choice of a proper design, he wished to say that it was very important that architects and engineers should know that unless the rules of the British Committee were applied it was quite possible that either the steel or the concrete in certain parts of the design might be stressed beyond the limits which had been specified. For that reason, he was of opinion that when competitive designs were required from various firms of specialists it was essential that the architect should state that the calculation must be based upon the rules of the British Committee, or that if any empirical rules were used, the specialist should be asked to certify that the limit of the stresses fixed by the British Committee had not been exceeded. The architect should check these figures or calculations to see that such was the case, for undoubtedly certain provisions or simplified methods adopted by some constructors, while giving correct results in some cases, did not give correct results in others. Finally, he wished to state that in his opinion the rules of the British Committee were quite reasonable and workable, and architects should specify their application in every case. With regard to Mr. Vawdrey's remarks, supposing any failure did occur in a work in reinforced concrete, who was going to see in a scientific manner the reasons for which such failure had occurred? What rules were going to decide and to fix the responsibilities? They all knew, of course, that the rules which had been put forward by the British Committee—so far as he knew, that was—had not been publicly accepted by everybody, but still he thought they, the engineers, ought to know what was going to determine the responsibility of the engineer in case of any failure, and he thought this Institute should take up the matter with a view to defining precisely what was going to happen in such a case.

Concerning Competitive Designs.

Mr. E. P. WELLS said that, in reference to the question of competitive designs asked for, he had always found that where several specialists or engineers had sent in designs on the same lines, and had adopted the same factors throughout, and where these quantities had been sent to contractors, there had been very little variation in the cost of the work, and he thought that variation was due primarily to the amount of profit added: but in some cases, where they found that designs had been tendered on and there was a difference of 33 1-3 per cent. between the highest and the lowest, they might be perfectly certain that there had been some serious error, and that the factors of what should be 4 to 1 were as low sometimes as nearly 2 to 1. He quite agreed that in all cases, when an architect or an engineer was asking for prices of reinforced concrete work, he should state what his factors were.

In some cases, in private buildings, it was perfectly safe for a cheap structure to work on 3 to 1 factors, because it was known that if even they asked for $\frac{3}{4}$-cwt. loading on an ordinary office floor, it was exceptional to get 25lbs., and in public schools, where they were asked for 3 cwt. per sq. ft. as the live load on the floor, the greatest amount they could get on it, by saying that each child weighed a cwt.—(laughter)—was 5lbs. per sq. ft. Some people did not know what they were asking for, and in all such cases there should be absolute tests, especially for paper warehouses, to load and to ascertain what the loads were before calling for competitive designs, because in some cases they were not stated, and the engineer had simply got to design his work on what he thought the load would be. He might think 4 cwts., another might think 3 cwts., and another 2 cwts. to the sq. ft.; the 2 cwts. got it, and it was a question of luck afterwards up to what it was loaded. With regard to the work that he designed himself, he might say that he never went beyond, in the South of England, 600lbs. per sq. in. in compression, and if he ran beyond that he made up the difference in steel. There was one cement he used that, where it was a case of necessity for going in for high stresses, he was working up to 2,000lbs. per sq. in., but that was a concrete which at 4 to 1 gave 600 tons per sq. ft. when 12 months old. Mr. Dunn had said that they always got better results from the tests of cubes than from the work in actual practice; but he disagreed with him there. He supposed he had made more crushing tests of concrete than anybody in that room, and he found that if they cut a cube of concrete out of concrete that had been put "en masse," or even to a larger size than the cube itself, they would get as a rule from 25 per cent to 50 per cent. greater crushing resistance than out of a small cube, owing to the fact that the moisture in the small cube evaporated rapidly as compared with concrete in large masses, and it was having that mass of moisture in the concrete which enabled the cement to gain in strength and also become very much denser, owing to the pores being filled up with the crystals of hydrate of lime. With regard to crushing and working concrete in compression, it was always absolutely safe to work up to 63 per cent. of its ultimate crushing without there being any sign of failure. In saying that, he must say it had been proved by experience, as he had had cubes under crushing machines for over ten days, and he had never found yet that if he loaded up to 63 per cent. he got any permanent set. If they had a good concrete made of Spurn gravel, they might take 75 per cent. of their ultimate, and they would be absolutely safe. He quite agreed with what had been said in reference to the complaints of the unnecessary loss entailed in calling for detailed drawings. He would not give a detailed drawing until the contractor was notified that his tender was accepted. The previous night he went over the amount of work that he had designed and provided quantities for up to the present time, and taking the commissions he had received in just on twelve months he found that it worked out at 0.16 of 1 per cent. of the whole of the works designed and quantities prepared for same. (Laughter.) If he had been compelled to give working drawings for all this work, it would have cost him about £6,000, which would very soon have landed him in the bankruptcy court. He did not think it fair for any architect to call upon a contractor for detailed drawings until the tender had been accepted, and then, if he investigated and found a deficiency of strength, having called for certain factors, the contractor must alter and comply with the conditions laid down. He also agreed with Mr. Dunn's remarks about the importance of the dead weight of a structure. This was very often overlooked, but it was one of the things when works were tested that were not taken into account, and it was one of the prime causes very often that when a beam was tested it broke, if the concrete was good, at very much more than the calculated allowance, and that was due entirely to the dead load being constant throughout, and only increasing the live load. With regard to Mr. Dunn's statement about gypsum in water, they did not come across it very often in England, but on the Continent it was very common, especially in the South of France. He had some reports sent to him a short time ago showing where tunnels and retaining walls had simply collapsed in twelve months, and in one case, where the water was taken afterwards from the site, and 3 to 1 briquettes were immersed in this water, in a little over a month they disintegrated. At Beeston, 50ft. down, they would get into water impregnated with gypsum to the extent of 14 grains to the gallon, which would very soon play mischief with concrete work, and that was due to a gypsum bank on the other side of the Trent on higher ground, and percolation taking place into lower levels. If that water was taken and pumped into a reservoir, they would have a collapse in a year or two.

Experience Gained from Failures.

Mr. H. K. BAMBER said the author of the paper had referred to the experience to be gained by failures, and in connection with that he mentioned the German iron ore cement, with which he did not claim to have had any special experience. As he (Mr. Bamber) knew something of that class of cement, it might be perhaps of some benefit if he said a word or two on that subject. There was a patent cement invented with a view to meeting the difficulty referred to, viz., the deterioration of Portland cement when in certain sea waters. The patentee's idea was to produce a cement with a raw material in order that the finished article might contain the smallest possible percentage of alumina. By using silica and iron ore the patentee had been able to produce such a cement, containing little less than 1 per cent. only of alumina, the ordinary percentage for British and German Portland cements being about 6 per cent. Members must not confuse the cement referred to by Mr. Dunn, this German iron ore cement, with the iron ore, or rather slag cements, which were prepared from the vitrified waste material for blast furnaces; there was a distinct difference between them, the difference being that whereas in iron ore cement there was a very small percentage of alumina, amounting, as he had said, to 6 per cent. or 7 per cent. only, in the case of the slag cements there was no less than 18 or 20 per cent. of alumina. It was strange that at this particular time the question of slag cements, which had for many years been before the engineer, was again somewhat to the fore. He would like to say, in connection with a remark made by Mr. Dunn, that in France and in Germany they particularly distinguished between cements required for land work and cements required for sea work, whereas in England such was not the case. He thought that to a certain extent Mr. Dunn was right, and that during the last few years the English manufacturer had brought himself to see that a distinction was required.

Testing for Strength.

Mr. W. G. PERKINS said he would confine himself to asking Mr. Dunn a question. He stated that the British rule for concrete in bending was to allow a maximum of 600lbs. per sq. in., and then he said that from experiments made with cubes in direct compression it was only safe to put 500lbs. He thought that was contrary to the general experience, that when a material was tested under transverse stress, it generally showed a higher co-efficient of strength than when under direct tension or compression. He believed the subject was first investigated by Barlow, who found that if they calculated the strength of a beam by using values obtained by direct testing that they did not get a true result, that the beam was very much stronger, and that he believed was corroborated by Sir Benjamin Baker.

Tenders and Pretenders.

Mr. J. MUNRO said that if an architect wanted his work properly done it seemed to him to be essential that he should go to those who made a practice of it, and did nothing else. In Edinburgh, where he came from, he knew of several builders who had styled themselves ferro-concrete specialists. They had seen firms—wild horses would not drag the names from him—doing work, and they had said to themselves, "This is a good thing." They saw steel put in, and they imagined that a bit here and a bit there would do all that was necessary; and they put it at the top of a floor instead of at the proper place. Small wonder if catastrophes happened. He would like to eliminate specialists of that description. He was at one with those speakers who had urged uniformity in tenders. He had a case in mind. He went in for a large contract in the Midlands, and as a matter of fact he got it, but only after a good deal of examination and introspection. Sixteen of them were invited—all sorts and conditions—and those sixteen all went on different lines, and in some cases the steel was stressed up to 13 and 14 tons in 1 sq. inch. When the matter was brought before the architect, he naturally considered afresh, and they were instructed to go on one common line, with the result that the whole thing was narrowed down to one or two. It just showed that architects ought to give a definite understanding of what they wished. In regard to preparing working drawings and details for tendering purposes, they had had quite enough of that, and he was not at all certain but that H.M. Board of Works was not about the biggest sinner in that respect.

About Hooped Concrete.

Mr. H. B. GATES said he had the honour to represent, more or less, Mons. Armand Considere. He noticed that Mr. Dunn had been kind enough to say something about hooped concrete, and that there was as yet much to be learned about the action of hooped concrete. But what Mr. Dunn said was quite contrary to Mons. Considere's experience. There was no more severe test for hooped concrete than to put a column into the form of a pile and hammer it, and if it was an efficient column and obeyed the laws which they supposed it to obey, he thought the stress developed by that hammering would show whether that column was efficient or not; his firm could show Mr. Dunn results in that respect which would demonstrate the full efficiency of the system to perfect satisfaction. As to checking calculations, Mr. Dunn said the deadweight of the structure was very important, and Mr. Wells had also remarked on the subject. They fully agreed that it was very necessary to allow for the dead load in making the test. The question of negative moments required every consideration, and he did not think the rules of the British Institute were always observed. With regard to the question of the right number of rods to be put in concrete work, which Mr. Dunn had also touched upon, there was a point which would be of assistance, and that was to use the method of construction or reinforcement in which all the reinforcing bars of a certain area were first placed completely in position, wired together in their proper places. If such a complete skeleton method was adopted, there would be no difficulty whatever in checking the members before the concrete was put in; they could pass the skeleton, and allow the concrete to be put in. He cordially agreed with Mr. Vawdrey in all his remarks concerning tenders for reinforced concrete work. It was highly desirable that engineers or architects should first settle their design and then invite contractors' tenders upon it. He thought the paragraph in Mr. Dunn's paper in which he confounded the design and the tender was somewhat obscure. The assumption in his paper was that there was only one price and contractor to each design, but generally there were four or five.

Bending Resistance.

Mr. CHAS. F. MARSH, M.I.C.E., referred to the compressive resistance of concrete in bending. It was well known, he said, that a cast-iron beam was very much stronger than if they calculated it on the assumption that it only had the same resistance as it had under direct compression.

"Coal Factor and Concrete Specialist."

The CHAIRMAN said the great point they had tried to arrive at out of the discussion was whether the contractors or the specialists would be satisfied if the architects and engineers were to always lay down in the simplest possible form that the R.I.B.A. conditions and regulations were to be kept to, and as far as he could hear there was not one serious complaint about anything in the R.I.B.A. conditions that did not meet with the views of the contractors present. That being the case, one could only advocate that engineers and architects should in the fewest possible words simply write at the top of their specifications of reinforced concrete that the conditions of the R.I.B.A. were to be kept to. They would thus safeguard themselves and the proprietors of the building. Mr. Munro brought out a point which he was glad he touched upon, and that was the influx of a number of so-called specialists. He had on his desk a letter which came to hand two days previously from a gentleman who described himself "coal factor and concrete specialist." It was only by architects and engineers protecting themselves by adopting some recognised formulæ for the designs, and also afterwards adopting some formulæ for the examination of the designs and supervision of the designs, just as they had special formulæ already for steel work, that they could hope to arrive at a general practice throughout the country which would give the members of the technical profession, and the contractors also, every satisfaction. There were several gentlemen who had referred to the amount of unnecessary work they were sometimes called upon to do when tendering, and he thought they were deserving of all sympathy. It was really quite ridiculous to see the trouble to which some specialist designers were put by members of the different professions who did not know exactly what they wanted, but they must always remember that they were dealing with an entirely new form of building construction so far as this country was concerned, and a certain experimental period must necessarily exist in the architects' office and in the engineer's office. Many an architect really did not know quite what he wanted beyond that he had heard that reinforced concrete was stated to be economical; he wished to adapt his design to that particular form of construction, and he experimented round it; but he thought that would right itself in a few years' time, as architects and engineers generally became more conversant with the various forms of reinforced concrete designs. (Applause.)

Mr. Dunn's Reply.

Mr. WM. DUNN, replying to the discussion, said he thought the discussion had been the most interesting part of the meeting. Mr. Gates spoke about the column invented by Mons. Considere, and questioned his statement that it suffered considerable change of form before the steel binding became effective. He had seen spirally reinforced columns tested, and he had noticed very considerable change of form. All scientific tests showed these, while he valued Mon. Considere's work very highly, he did not think they had arrived at such a good understanding as he hoped to see. He thought Mr. Bamber's remarks were most interesting, and they now looked for a better cement for use in sea water. Mr. Wells had spoken of putting heavy loads on his concrete. The Institute allowed a heavy stress to be put upon strong concrete, but when Mr. Wells assumed that 75 per cent. of the ultimate was a safe load, he was afraid he took a more rosy view of the matter than he (Mr. Dunn) did. By-and-bye, they would get more knowledge and become more daring. The feats of some young architects had been mentioned, and he had himself seen some very daring feats indeed. If he himself had done them they would have been down. It seemed to him that the more they knew about it the less they could play tricks with materials. When they were very inexperienced they did wonderful things which stuck up. He had seen builders dig away the foundations from a wall, which by all rules should have been bruoght down at once, but remained up. But if an architect or an engineer were to do that it would come down at once. He advocated caution, which Mr. Munro's countrymen had always been famous for. It was, he thought, generally accepted that the British Committee's requirements were practical, reasonable, and workable, and he thought there was every likelihood of them being embodied in by-laws by various public authorities. He believed the County Council accepted them in practical works. With regard to Professor Beresford Pite's remark that they should deal with this question from the archæological and artistic point of view, that would be more suitable for another institute. He had to thank those present for their remarks, and for the attentive way in which they had listened to his papers.

Mr. WELLS announced that the next meeting of the Institute would take place at the Royal United Service Institution on Thursday, February 18th, 1909, at 8 u.m., and this brought the meeting to a close.

MONOLITHIC CONSTRUCTION AND METHODS OF CALCULATING STRESSES.

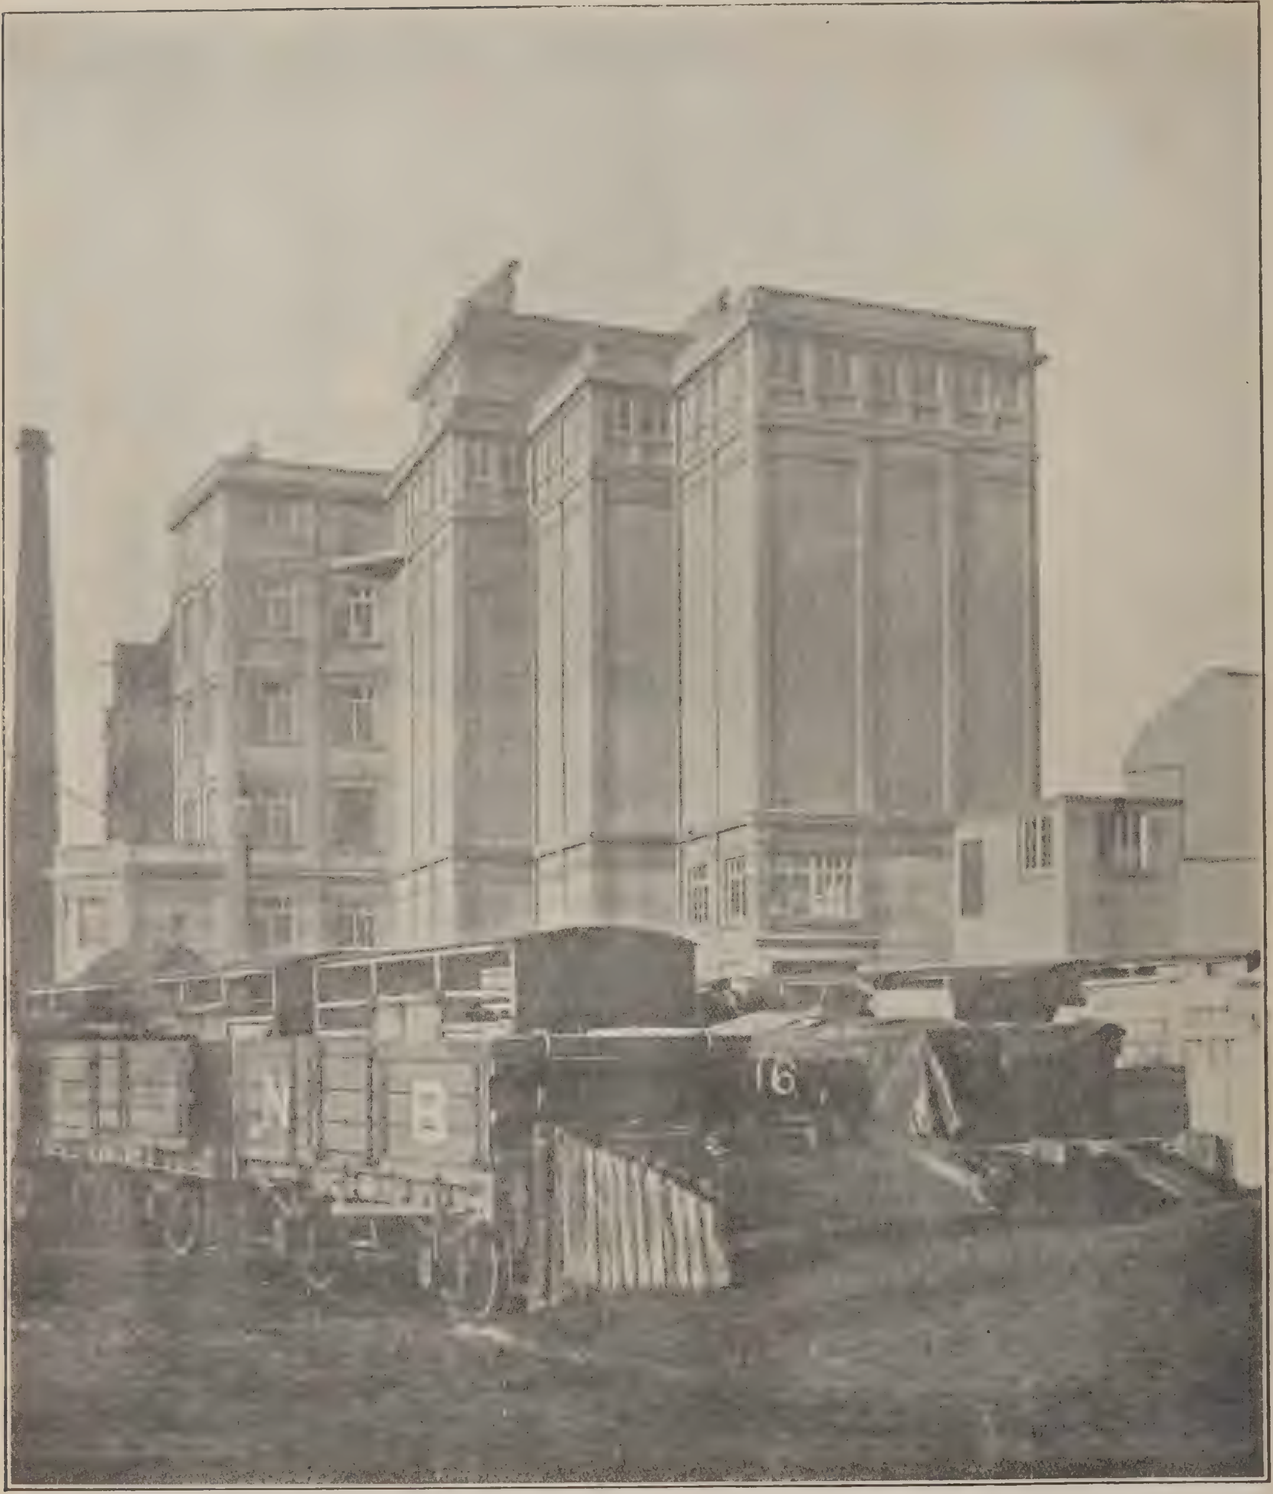
Among the interesting points in the design of reinforced concrete structures, upon which there are very little data that have been obtained as the results of direct tests, is the question of the bending moments in continuous floor construction. With reinforced concrete, the advntages not only in the way of economy, but in the rigidity, freedom from vibration, and stability, gained by the building of the whole structure as a monolith, have been generally accepted, and we are accustomed to find reinforced concrete structures designed with floors as one continuous whole, running from one external wall to the other. Those who have studied the subject in any detail will know that the beams which come below the floor form in reality mere ribs to the floor slabs and beams, and are not similar to those in steel or timber frame construction, namely, of the character of rectangular beams sustaining a floor slab that consists of merely a filling between, but are of the nature of a T beam, part of the floor slab acting as the head or table of the T, while what we call the beams or portions projecting below the floor slab constitute merely the rib or upright member of the T.

Engineers designing in reinforced concrete have made various assumptions in the designing of such ribbed continuous floors, and these assumptions have been based upon a good many experimental data. But the tests that have been conducted have practically all been upon T-headed beams of only single span. Very few tests have been carried out with test beams stretching over several spans, and the information on those that have been tested is not readily available; in fact, we do not know of any records on the subject, though we have seen a statement by M. Considere, that he has tested a continuous beam of three spans. But even tests upon independent beams of T section are hardly sufficient. We really ought to test several parts of a structure to destruction, and make careful observations at every point to ascertain the deflections and the effect of differently applied loads at the first points of failure. Furthermore, it would be desirable to have tests on independent beams resting on several supports in which the reinforcement varies according to the several distinctive systems upon the market in chief use. Such tests would provide us with the information which we at present do not possess, namely, upon the amount of fixity that is obtained at the ends of the beams and over supports. The French Ministerial Commission on Reinforced Concrete suggested that certain allowances should be made, and M. Considere, American authorities, and others, have advocated various amounts of reduction to adopt in calculating the moment of resistance on pieces extending over several supports. This is due to the obvious fact from theoretical considerations that the building-in of a reinforced concrete beam is not perfect, but as to the allowance it would be correct to make there are no experimental data. The building-in may be much more perfect than is supposed; on the other hand, it may be much less. Then, again, the different methods of reinforcement obviously must affect the amount which we should allow for the building-in of the ends. If the building-in at the ends of any pieces were perfect, we obtain from pure theory that the maximum bending moment will be $\frac{wl^2}{24}$ in a uniformly distributed load, and $\frac{Wl}{8}$ in a concentrated load applied at the centre; the reverse bending moment at the supports under the two conditions of loading are $-\frac{wl^2}{12}$ and $-\frac{Wl}{8}$ respectively. Now, some of the early constructors, among them being M. Hennebique, in calculating the bending moment under a uniformly distributed load, take it as $\frac{wl^2}{10}$ at the centre of the span. If we adopt such a theory, obviously the bending moment at the support will be $-\frac{wl^2}{40}$ For concentrated loads on the same assumption we obtain $\frac{Wl}{5}$ at the centre and $-\frac{Wl}{0}$ at the supports. The American regulations require that reinforcements sufficient to resist these amounts of reverse bending moments should be placed over the supports, but experience with actual structures has shown such reinforcement, in many cases, to be insufficient. When beams are fully loaded, it is sometimes found that cracks develop over the supports, though this does not mean that the structure becomes dangerously weak. If these cracks are only sufficient to expose the reinforcement to the danger of corrosion, and not sufficient to rupture entirely the reinforcement at these points, there is no great loss of stability involved, but, if the reinforcement over the supports is thoroughly inadequate under heavy loading, then the beam between, when cracking has taken place, is called upon to act as freely supported, when, of course, the assumption of $\frac{wl^2}{10}$ is too small for the correct bending moment, for under these conditions it should be $\frac{wl^2}{8}$. It has consequently been proposed as a more reasonable assumption, to adopt as the bending moment the following formulæ for the centre of each span:—Uniformly distributed load, $\frac{wl^2}{12}$; concentrated load, $\frac{3Wl}{16}$. If we make this assumption, we must then, to be logical, provide reinforcement over the supports to resist the reverse bending moments, which become $-\frac{wl^2}{24}$ and $\frac{wl}{16}$ respectively.

All this is very haphazard, and not by any means sufficiently satisfactory. In building our beams, we make the moment of resistance equal to the assumed bending moment, but it does not quite follow that the theoretical assumption will work out in practice.

(To be concluded.)

Newport, Mon.—A scheme has been prepared for the erection of about 300 houses on the Malpas Road.



GRAIN SILOS AND FLOUR MILLS, EDINBURGH. F. A. MACDONALD, STRUCTURAL ENGINEER.

GRAIN SILOS AND FLOUR MILLS, EDINBURGH.

The new grain silos and flour mills shown in the accompanying illustration have been built near the Haymarket Station, Edinburgh, for Messrs. John Herdman and Sons, Ltd.

The buildings, which are of reinforced concrete, stand on a site of somewhat limited extent, bounded on the south by the goods sidings of the North British Railway Company, and on the north by the Murrayfield Road. On two sides, therefore, there was no room for extension. The difficulties of the situation were somewhat unusual, and they have been skilfully overcome. The new mill had to be built over an existing railway siding, on which traffic was constantly maintained. Extensive excavations involved the underpinning of the adjoining mill and premises. An old sewer which crossed the site had to be taken up, diverted, and reconstructed. Nevertheless, the work went smoothly on without any delay from beginning to end.

As will be seen from the illustration, the new mill is of seven storeys, and rises to a height of 106ft. 6ins. above rail level. In addition there are several chambers sunk to a depth of 12ft. below the ground-floor level. From the column footings to the roof the approximate height is 120ft. 6ins.

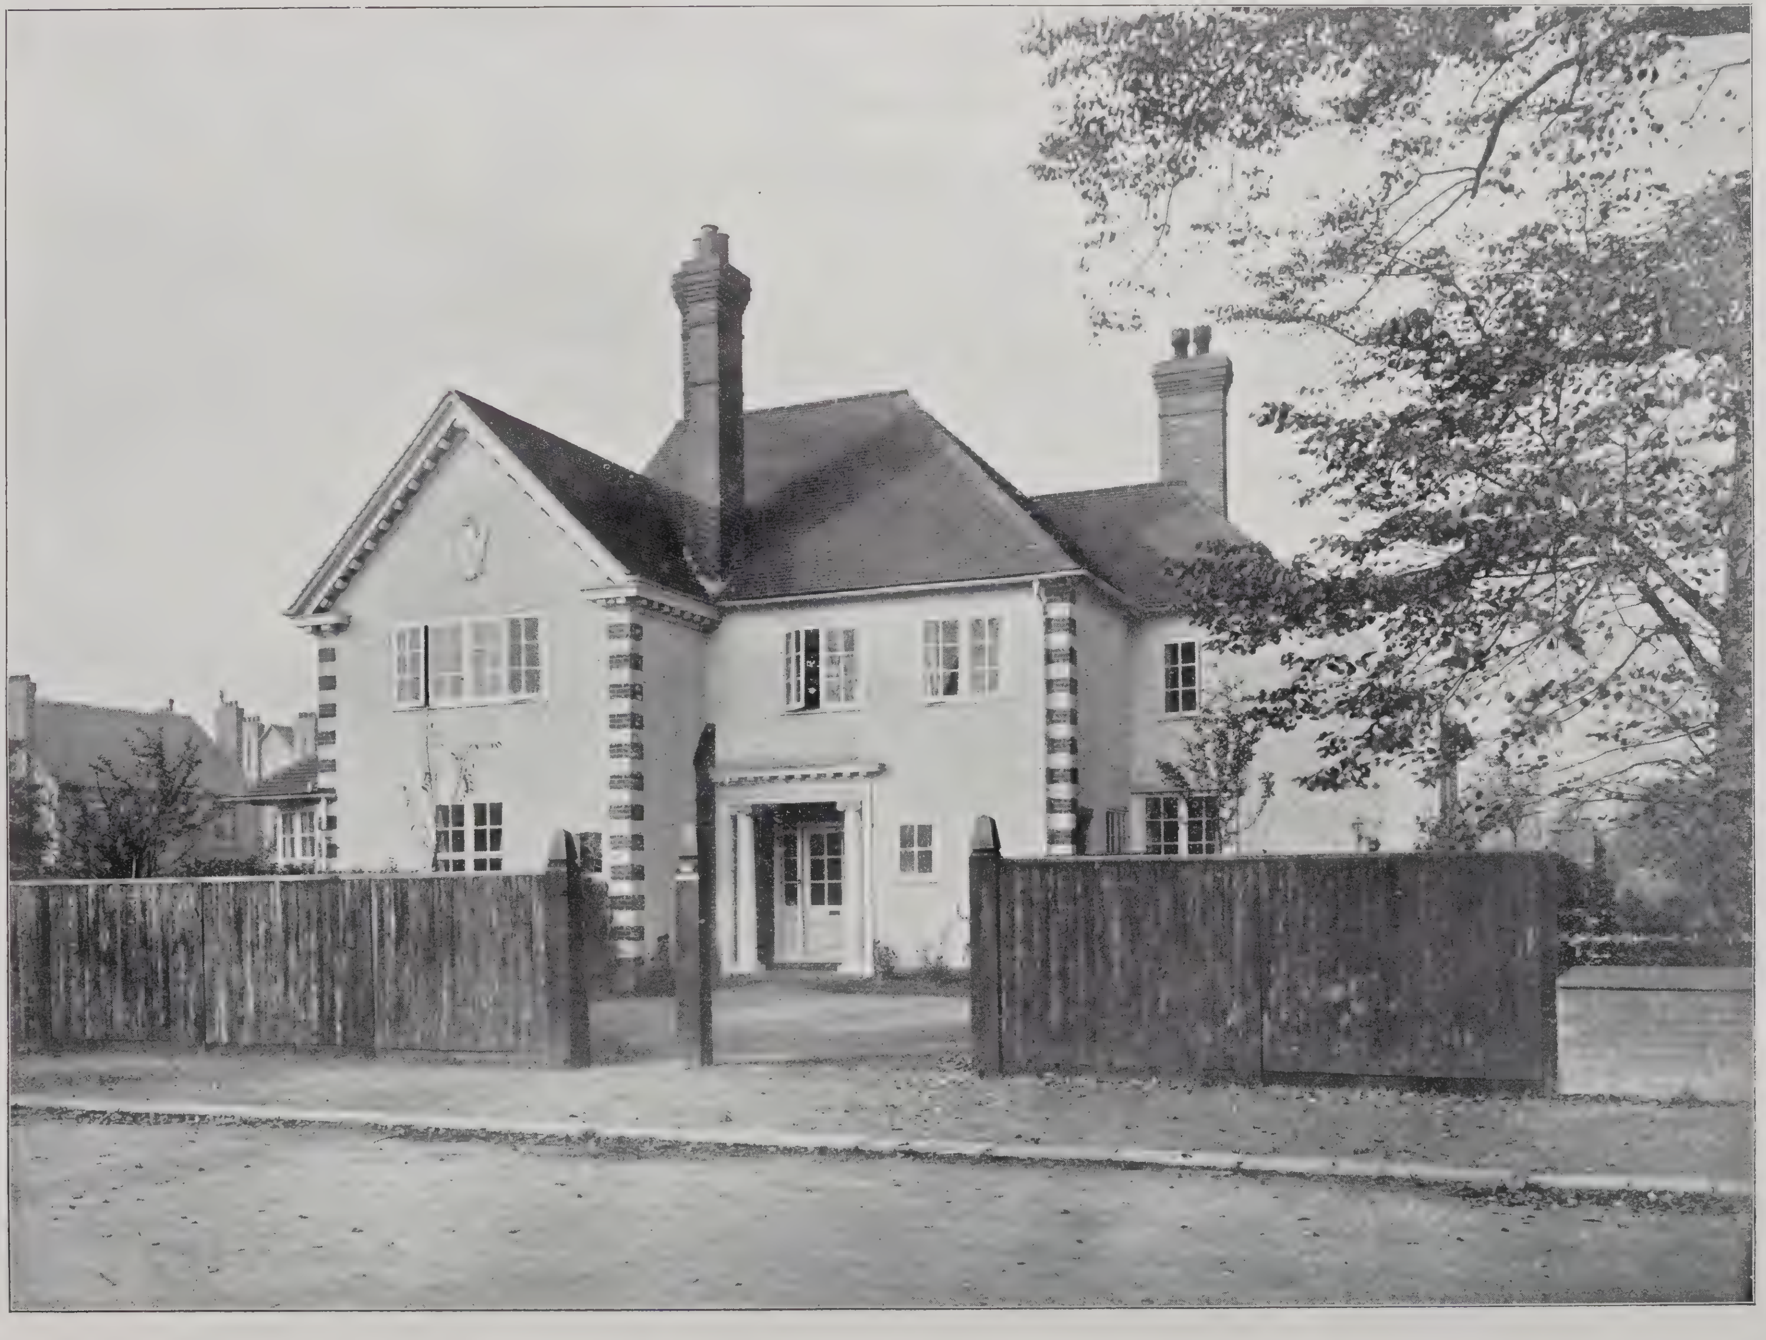
The grain silos consist of twenty-one large chambers or bins, each 10ft. square and 56ft. in height, with a capacity of 4,500 bushels of grain, and there are also one double bin of the same capacity, and twenty-eight small mixing bins, each to hold 900 bushels of grain. The total capacity of the silos is 128,000 bushels of grain, equivalent to 3,550 tons load.

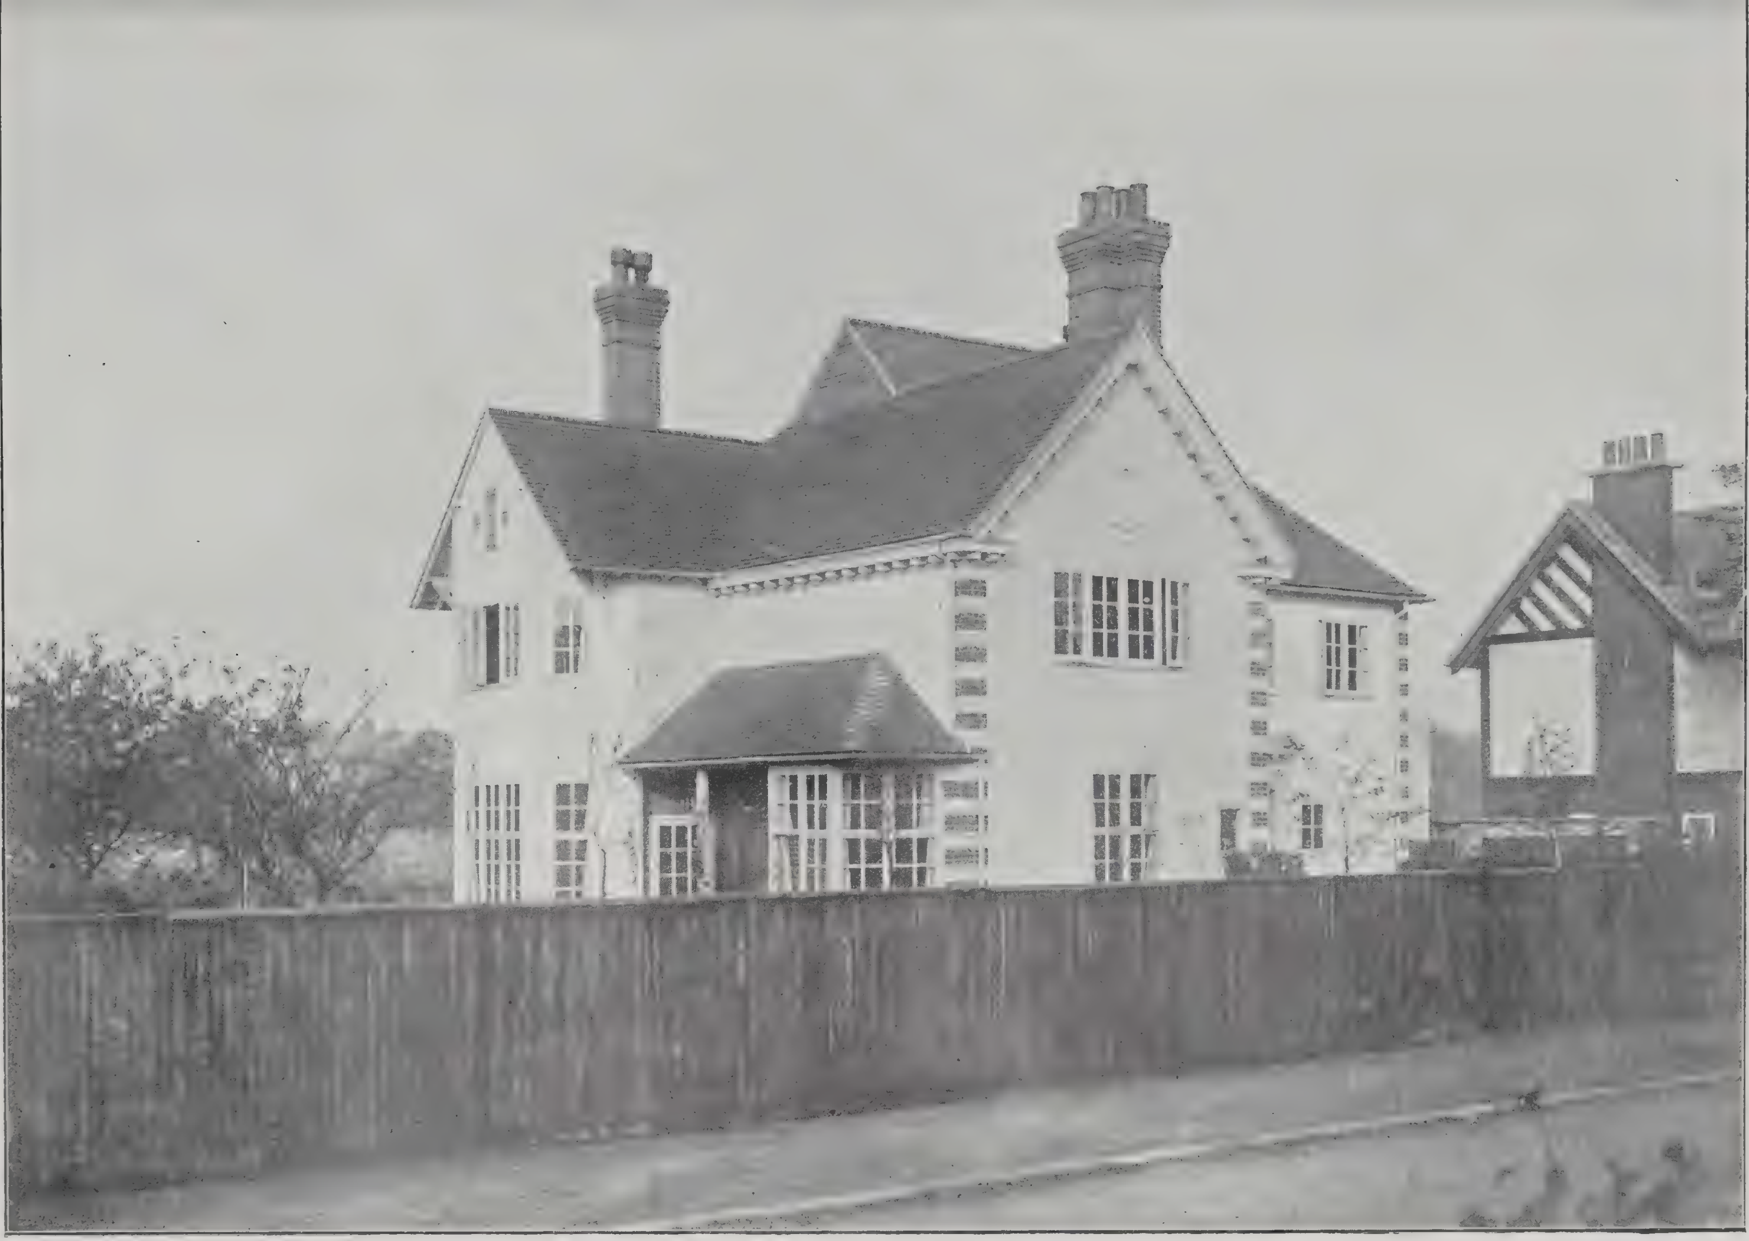
The retaining walls of the main silos are 18ft. in height, and are constructed of reinforced concrete 7ins. thick, with counterforts at every 10ft., for which the main supporting pillars have been utilised. The walls of the sunk basement chambers are also of reinforced concrete.

The first floor of the new mill is carried across the railway siding by means of reinforced concrete arched beams, which support not only the first floor, but also a column rising from the key of the arch to a height of 90ft. On the same floor level will be found a reinforced concrete building projecting in cantilever over a railway siding. The pull cantilever is 16ft., and this projecting building has been so constructed as to allow locomotives to pass underneath, and also to facilitate the hoisting of sacks out of waggons into the main mill.

In three of the upper storeys heavy wood

Supplement to THE BUILDERS' JOURNAL AND ARCHITECTURAL ENGINEER, *Wednesday, January 6th, 1909.*





HOUSE AT DIDSBURY, NEAR MANCHESTER. FAIR AND MYER, A.R.I.B.A., ARCHITECTS.

construction on reinforced concrete beams has been used for the flooring. The object in using the wood was to permit of cutting for the passage of the numerous belts, spouts, trunks, elevators, etc., passing through these floors. The floors over the silos are all of reinforced concrete.

The tower is surmounted by a reinforced concrete reservoir, which, with a capacity of 7,500 gallons of water, is situated at a height sufficient to command the whole of the mill and premises in the event of fire.

The enrichments to the exterior consist of raised surface rectangular panelling and deep frieze cornices. The cornice at the tower level has a projection of 3ft. and is further enriched with heavy dentils. The effect produced by the natural and broad treatment of a reinforced concrete elevation contradicts the prevailing impression that such elevations are necessarily cold and displeasing to the eye, for there can be no doubt that the general effect obtained in this case is distinctly successful.

The structural engineer is Mr. F. A. Macdonald, of Glasgow.

The folowing contractors were engaged on the work: Excavation, mason and reinforced concrete, Robert Thorburn and Sons; joiner and glazier work, W. and J. R. Watson, Ltd.; plumbers, Morrison and Sons, (these are all of Edinburgh); asphalter, Adam Lock, Leith; iron staircases, Walter Macfarlane and Co., Glasgow.

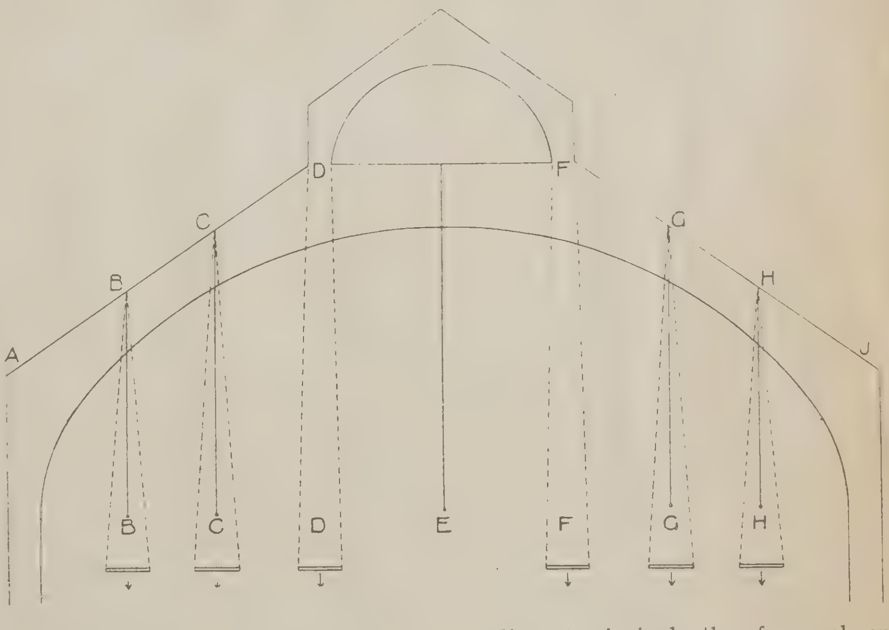
Arrangements have been made at the London County Council Central School of Arts and Crafts, Southampton Row, W.C., for a course of experimental instruction in structural mechanics, conducted by Mr. Percy J. Waldram on Friday evenings, from 7.0 to 9.30, commencing Friday, January 8th, 1909. Experiments will be performed by students upon suitable models and apparatus to determine the stresses and deflections in beams, columns, and roof principals, shoring, etc., and the stability of buttresses, retaining walls, arches and domes. Lectures will be given upon practical design and calculations without the use of higher mathematics, and examples of construction will be worked out. New classes in the school of architecture are also announced. It is proposed to form groups to study the following subjects if a reasonable number of students make application:— i.—A. working drawings and applied geometry; f.—B. foundations: shoring and underpinning; f.—C. sanitation; 1.—D. specifications and estimating; f.i.l.—E. modern construction and use of materials. f.—will assist students working for the final R.I.B.A. examination; i.—will assist students working for the inter R.I.B.A. examination; l.—lectures on the chemisry of materials will supplement this. These classes will run one hour each, one night a week; they will be taken by Mr. S. B. Caulfield, F.R.I.B.A. Arrangements have already been made to begin groups A. and D. A.—Wednesday, 7.30-8.3; D.—Friday, 8.30-9.30.

CROYDON CENTRAL BATHS, SCARBROOK ROAD.

The Croydon Central Baths comprise an open-air swimming bath, a covered swimming bath, and the usual slipper baths for men and women. Having regard to the large population around, and the difficulty of obtaining a site, it was resolved to add a further covered swimming bath to the present institution built upon land belonging to the Council. The extension, as designed by the borough engineer, Mr. G. F. Carter, M.I.C.E., contains a swimming hall about 120ft. by 61ft., with a platform space in addition, and two club-rooms. The swimming bath is 100ft. by 35ft., varying in depth from 3ft. 6in. to 7ft. 6in. Along two sides and one end are plain galleries for spectators, surmounted by dressing-boxes. The swimming hall is roofed over with concrete ribs, and includes a continuous lantern for light and ventilation. More than 800 persons can witness a swimming entertainment, and if the bath were covered in there would be a fine hall capable of holding about 1,500 persons. The cost will be a little more than £8,000. The baths are situated in the centre of the town. The new bath is so designed that it will enable first-class swimming entertainments to be held, and the depth has been made to satisfy the provisions of the Diving Association. The Local Government Board first sanctioned a loan for the new building, but deferred that portion of the estimate which had reference to the roof. The roof was designed to be carried by eight ferro-concrete ribs, having a net span of 61ft. The Board requested that two ribs be selected, and tested by some impartial expert. The specification stated that the centering for each rib should be struck 56 days, and the test applied at 60 days from the construction of the rib. The borough engineer appointed Mr. W. G. Kirkaldy, and on September 25th, 1908, he tested two of the ribs in the presence of the Local Government Board's inspector, Mr. A. A. G. Malet. The Board thereupon gave their sanction to the construction. The reinforcing of the concrete ribs and purlins is by means of Kahn trussed bars throughout.

Results of Test on Croydon Baths Roof.

Results of experiment to ascertain the behaviour under test-load of two reinforced concrete roof principals. Proportions, 2½ parts ballast, 1½ sand, to 1 part cement. Age when tested, two months (sketch merely diagrammatic, to illustrate position of application of load). Test conducted by Mr. W. G. Kirkaldy on September 25th, 1908.



The leading platforms were slung from two adjacent principals, therefore each was subject to half the load recorded. The deflections were observed by means of a cathetometer to $\frac{1}{10}$ millimetre, and the calculated equivalent in inches given above. The zero was taken with cradles suspended. On removal of the load from cradles, there was no permanent deflection or set. The amounts of test-load were planned by Mr. Carter.—DAVID KIRKALDY & SON,

(See p. 13.)

THE BRITISH ALUMINIUM CO.'S WORKS AT KINLOCHLEVEN, N.B.

The great and increasing demands for aluminium, the constructional, electrical and domestic uses of which are now legion, have resulted in The British Aluminium Company, Limited, undertaking a great scheme for the manufacture of the metal at Kinlochleven, Argyllshire. This will largely increase their output, already great, for they already have factories at Larne, Foyers, Greenock, and Milton, as well as abroad at Stangfjord and Orsieres. A dam has been constructed 5½ miles from the head of Loch Leven, to conserve the necessary water to provide the power, which will amount to over 30,000 h.p.

The pipe line extends from the dam to the village at Kinlochleven, which has been entirely created by the enterprise of the Company. Two large factories have been constructed, and the Carbon Factory is the subject of the majority of our illustrations. Its S.W. elevation is shown. Reinforced concrete on the Coignet system has been employed for the foundations, which required skilful design and careful construction to insure absolute rigidity, owing to the elaborate construction of the great baking furnace, which is the *raison d'etre* of the factory. Though the illustrations show the works in a comparatively early state of their erection, they are now practically completed. Probably, however, the most interesting feature from the point of view of reinforced concrete, will be the gigantic bunkers which are now in course of construction. We believe it is correct to say that they will be by far the largest bunkers ever built in armoured concrete, and probably the biggest works of that kind ever constructed in this country in any material. One of the illustrations shows the main columns on which the bunkers are now being built.

The aggregate use for the reinforced concrete was crushed local stone, carefully screened and washed, and the cement employed was of the "Ferrocrete" brand, which is specially manufactured for reinforced work. Stringent tests have been carried out on various parts of the building, with results that have proved very satisfactory to those concerned, both with the design and the construction.

The factory walls are of rubble masonry, of local stone, and the roofs are of steel, the patent glazing being carried out by The British Luxfer Prism Syndicate, Limited. and the steel sashes by Messrs. Field, Mallett and Co.

The factory is equipped with labour-saving plant of the most modern description, by Messrs. Graham, Morton and Company, the boiler is being supplied by Messrs. Andrew Brown and Company, and the motors and switchboard by Messrs. Siemens' Bros., Dynamo Works, Ltd. The contract for the furnace, which will develop a very high temperature, was placed with Mr. Jens Orten-Boving.

We also show views of a culvert about 500ft. long, at Kinlochleven, which has been constructed in connection with the British Aluminium power scheme, on the Coignet System, by Messrs. McLaughlin and Harvey, of Belfast. The architect for the factories, and also for the village, offices, etc., at Kinlochleven, is Mr. A. Alban H. Scott, M.S.A. (of Messrs. Scott and Fraser, 10, Basinghall Street, E.C.). The whole of this great enterprise has been carried to its successful conclusion under the direction of Mr. W. Murray Morrison, Technical Adviser to and Managing Director of The British Aluminium Co., Ltd.

SOME OF THE BUTTRESSES, SHOWING THE REINFORCEMENT.
A. ALBAN H. SCOTT, M.S.A. (SCOTT & FRASER), ARCHITECT.

The main building contract is in the hands of Messrs. Robert McAlpine and Sons, of Glasgow and London, who specialise both in reinforced concrete and in the rapid construction of factories.

Messrs. Robert McAlpine and Sons have also just completed for the Dundee Corporation, reinforced concrete foundations, on the Coignet System, and they are making considerable use of reinforced concrete at the large contract for the Island Barn Reservoir, for the Metropolitan Water Board, under the direction of Mr. Wm. B. Bryan, M.Inst.C.E.

RUSTING OF STEEL INSIDE A CONCRETE COVERING.

We have received the following letter from the Concrete Institute:—

Dear Sir,—It has been brought to the notice of the Concrete Institute that in one or two reinforced structures a noticeable deterioration has taken place on account of the rusting of the steel inside the concrete covering. Apparently these cases are very rare, the bulk of the structures having stood the test of time exceedingly well. These special cases have, however, served to cause some uneasiness to engineers and architects who contemplate using this material, and to others who have to sanction that use. It is most important that the reputation of a building material, which is undoubtedly successful and excellent, should not be marred by occasional mishaps. The Science Standing Committee of the Concrete Institute has, therefore, been asked to investigate these cases of rusting and to find out their cause, in order that such deterioration may be entirely prevented in future. You are asked, therefore, to assist the Committee by giving them all possible information about the behaviour of any reinforced concrete structures which have come under your notice, whether they have suffered or not. Such information will, if you desire it, be treated as strictly confidential, and in no case will names, either of persons or places, be published. It is felt, however, that members of the professions will not hesitate to tell all they know about this material, seeing that it has come into use so recently that no amount of foresight could be expected to guard against every form of deterioration. The Committee will gladly reciprocate your courtesy by placing at your disposal the conclusions they come to after they have investigated the matter.

It is suggested that the information may be given in the form of answers to the following questions, but it will be readily understood that whether or not this form is adopted, it will be of great assistance to the Committee to have information as full as possible. Hand sketches or drawings will be of great value.

(1). Have you ever examined any reinforced concrete structure with a view of ascertaining whether the reinforcement was rusting under the concrete?

(2). What was the nature of the structure?

(3). Did you cut away the concrete or merely examine the surface?

(4). Was the structure exposed to wet or bad weather?

(5). What was the nature of the concrete? Mixture, thickness, condition?

(6). What was the nature of the reinforcement? Iron or steel, thickness of main bars, thickness of secondary reinforcement, and thickness of covering of concrete?

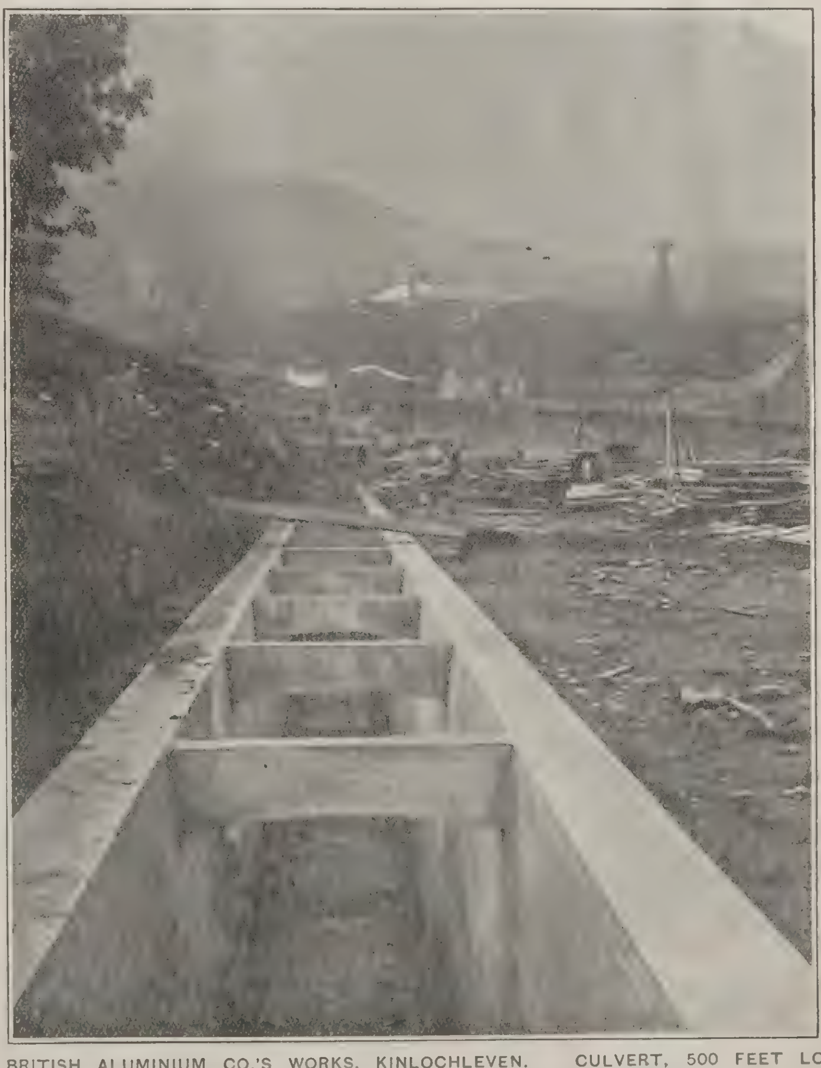
(7). Did you find the steel rusted? If so, to what extent?

(8). Did you find the concrete cracked? If so, to what extent?

(9). Are there any special circumstances, such as heavy load, special chemical action, etc., which may have affected this case?

I am, dear sir, yours very truly,
ARTHUR. E. COLLINS,
Hon. Secretary.

P.S.—Replies are requested by February 1st latest, but an early reply would be much appreciated.



BRITISH ALUMINIUM CO.'S WORKS, KINLOCHLEVEN. CULVERT, 500 FEET LONG.
A. ALBAN H. SCOTT, M.S.A. (SCOTT & FRASER), ARCHITECT.

REINFORCED CONCRETE SYSTEMS.

The Chain Concrete System.

What is known as the Chain Concrete system of reinforced concrete construction has now been in use for several years in Yorkshire, and the merits of the system soon spread its fame far beyond that county. The Chain Concrete Syndicate commenced operations in Castleford, but they now have their chief office at 1, Basinghall Square, Leeds, and they are conducting a considerable business in various parts of the country. The system is the invention of Mr. R. M. McDowall.

Briefly, the system consists in the adaptation of a patent clip, the form of which is shown in Fig 1. Because we can sum up the basis of the system in such a contrivance, it must not be supposed that this constitutes the whole sum and total of the system. Far from it; the clip only represents a fundamental idea which Mr. McDowall has applied. The system in its entirety embraces many variations upon other systems, and the patent clip becomes simply a method of attaching one reinforcement to another.

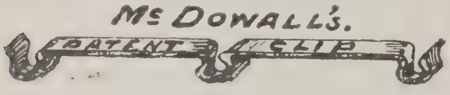


FIG. 1.

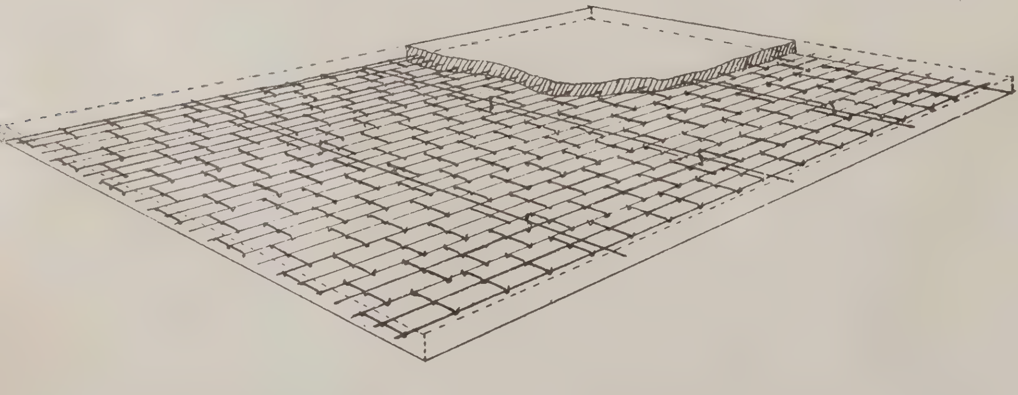
The Chain Concrete Syndicate recognises the importance of providing against the possibility of the steelwork getting out of place during the process of concreting, and their clip attachment is their means of endeavouring to overcome this.

Fig. 1 shows, in a general way, how flat strip iron is nipped round the bars, and the clips not only conform to that illustrated in the figure, but in the succeeding illustrations they are shown in various other forms.

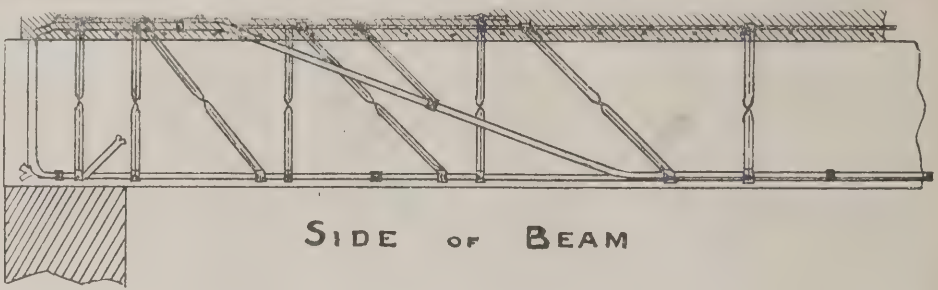
The clips are made from flat bar steel ¼in. thick, and from ½in. to 1½ins. broad, according to the position they occupy, and are cut by special machinery to the exact patterns required.

It will be obvious that these clips can be used to obviate any danger of the bars sinking under the weight of concrete, so as to come too close to the under-surface of the concrete, and so expose them to the danger of having insufficient protection in the case of fire.

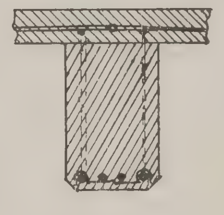
The form of clip with three loops, illustrated in Fig. 1, is used for floors and walls. The loops are made to provide any spacing of the rods, such as, for instance, at 4in. to 6in. centres. The bars are placed in each loop, and the clips set at specified distances apart on the bars. They are then clinched with special tools. The general arrangement of a floor slab reinforced in this manner is shown in Fig. 2. It is obvious by thus connecting the rods when they are fixed so that they cannot get out of place in the operation of applying the concrete, that an advantage is obtained by such means quite apart from the advantages before mentioned, for the whole of the steelwork for a floor can be assembled in place and checked before any of the concreting is undertaken, and no fear need be had of the bars getting out of place.



PATENT STEEL CHAINWORK.
FLOOR PANEL.
FIG. 2.



SIDE OF BEAM



SECTION
FIG. 3.

For reinforcing beams, the method employed is to use round steel rods for the main bars, some of these running straight through to the supports, while others, in the case of beams built-in or continuous, are cranked up at an angle of about 35 degrees, partly to take shear and partly to bring the reinforcement in place to resist the tension at the top of the beam over the support. For additional reinforcement against shear, the clips, formed in the same way as for the slabs, are fixed to the bottom bars and to a similar top rod. At the centre of the beam the clips are placed vertically, but towards the supports they are placed at an angle of approximately 45 degrees. In this way the reinforcements are locked together and do not become displaced in the process of concreting, and the provision of a top rod makes the work of construction more convenient, and reduces the depth of the beam. Fig. 3 shows how additional top rods are placed over the supports when the tension is considerable.

Fig. 4 shows the connection of two beams with a column, or rather, we may call it a continuous beam reinforcement. The method of turning over the ends of the top rods may be noted, and the other general methods involved.

The column foundation (Fig. 5) is also somewhat novel in its method of reinforcement, but to those familiar with the theory of the subject its advantages will be obvious The plan of the foundation base of the column in conjunction with the section shows how the rods are clipped together.

As regards the reinforcement of the column here illustrated, the remarks we make apply equally to piles. The columns (or piles) may be square, or other shape, in cross section. Main bars are placed vertically in the column at the angles and at the centre. The rod that is directly in the centre, is of smaller section, as a rule, than those on the outside. The main outside rods, connected by McDowall's patent clips, are clinched at each end to the bars as before described for floor slabs. In addition to the horizontal clips, others are placed inclined from the outside rods to the centre rod. In this way the corner of the column is reinforced, and the tendency to outward bulging and internal cracking are alike resisted. The provision of this central vertical bar is a feature of the system which is novel as far as we are aware in reinforced practice.

Fig. 6 shows floors, corridors, and flat roofs in course of construction on the Chain Concrete system at the new Secondary School at Castleford, of which Mr. W. S. Braithwaite, of South Parade, Leeds, is the architect. Diagonal distribution rods may be noted, and the arrangements of the clips is very clearly shown in this view.

(*To be concluded.*)

In Parliament.

Coal Residues in Reinforced Concrete.

In the House of Commons on 21st December, Mr. Annan Bryce asked the President of the Local Government Board what had been the result of inquiries which he promised to make as to the forbidding throughout Germany of the use of coal residues in reinforced concrete for building purposes, and whether he proposed to take any steps with regard to the use of such material in England.

Mr. John Burns stated:—I have made some inquiry on this subject, but my investigations are not at present concluded, and in the meantime I am not in a position to come to a conclusion with regard to the use in England of the material referred to.

The new gates required in connection with Mr. F. W. Speaight's scheme for the improvement of the Marble Arch have now been placed in position. They were designed by the Office of Works, and were wrought by Messrs. H. H. Martyn and Co., of Cheltenham. Their total cost will be about £3,000, and the work has occupied some seventy or eighty workmen for about three months. The weight of the gates is estimated at nearly forty tons, and the whole of the material, as well as the labour employed, is British.

Trade and Craft.

Electric Lighting Specialities.

The "Diamond H" switches, described and illustrated in catalogue C of the Hart Manufacturing Co., Hartford, Conn., U.S.A., whose European branch is at 72, Victoria Street, S.W., are the product of many years of experience in the invention and manufacture of switches and accessories. Stress is laid on the scrupulous care used in the selection of the material that is best suited to the different purposes. All parts are made sufficiently strong, and the mechanism of both push button and rotary switches is simple and efficient. Sheet mica, which will neither wear out nor burn out, insulates the mechanism from the current-carrying parts. The parts of the mechanism subjected to wear are made of case-hardened and tempered tool-steel, and the contacts are of genuine phosphor-bronze. All switches, as made by this company, indicate clearly whether the switch is "on" or "off," the said condition being shown by the buttons of the push switch, or by the position of the handle of the rotary flush switch, or, in the case of the surface switches, by an indicating dial. One of the many advantages in the use of these switches, more particularly from an artistic standpoint, is that they are sunk flush with the wall of the room. The face plates may be made as elaborate as desired, and in a great variety of finishes. These are usually designed to correspond with the other metal fittings of the room in which they are installed. An adjusting spring with which the rotary handle is provided is contained in the body of the handle, and not between the body of the handle and a separate collar. The lock push switch is operated by means of a key, the keyholes being of such a shape that nothing but the proper key will control the switch. The rotary lock switch contains a spring-pressed stud which carries a feather adapted to engage the notch in the end of a removable key. The "Diamond H" automatic door switch, for operating a light on the opening or closing of a door, is enclosed in a porcelain box, and the face-plate and strike are of brass; the part making the connection between the two spring phosphor-bronze contacts being carried by a swinging arm driven by the switch mechanism. A very compact apparatus is the combination tandem gang, which, comprising two push switches and one rotary electrolier switch, is for use in banquet halls, drawing-rooms, etc. The push switches control the side or bracket lights, and the central switch controls the central electrolier, and has four operations. The first turn lights one section, the second turn two sections, the third turn the whole electrolier, and the fourth turn puts all the electrolier "off."

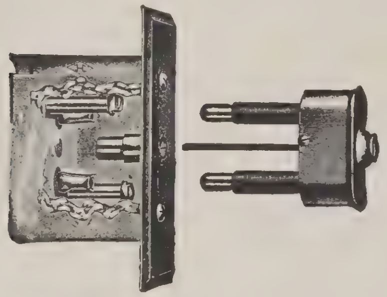

Fig. 1. Showing plug out.

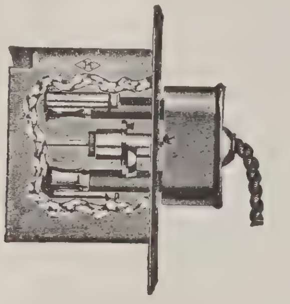

Fig. 2. Showing plug in.

Another product of this firm is the flush receptacle and plug, with automatically closing apertures, which may be sunk either in the floor or in the skirtings of a room. When the plug is withdrawn, the plate is automatically sealed up, thus excluding dust and moisture. These plugs are in very general use for many purposes for which a plug is desirable. They are particularly adapted to the installation of electric radiators. Descriptive lists and all other information may be obtained on application to the company's offices, Belgravia Chambers, 72, Victoria Street, London, S.W.

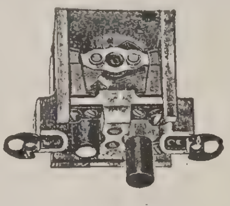

Fig. 3. Showing Switch.

This booklet is particularly valuable for the very full description given in each instance, and for the clearness with which the mechanism is shown in the illustrations.

* * *

D. G. Somerville and Co.

Messrs. D. G. Somerville and Co., of 72, Victoria Street, S.W., manufacturers of fire-resisting flooring, and specialists in structural steelwork, etc., intimate that, in view of the continued increase of their business, they are building large offices for their engineering staff at their works, Archangel Wharf, New Cross, S.E. The Westminster address of the firm will be 116, Victoria Street, S.W., as from December 25th, 1908.

* * *

Honeyman Ventilating System.

Ventilation by the Honeyman system is described in an ingeniously contrived folding booklet that has just been issued by Messrs. Richard Crittall and Co., of 197, Wardour Street, Oxford Street, W. The distinctive peculiarity of the apparatus is that it creates an exhaust current in a large tube by means of a much smaller tube or orifice, which is an inversion of the usual arrangement. A tube of only 3ins. in diameter is all that is required to create a strong exhaust action in a tube 10ins. by 16ins., so that a comparatively small apparatus gives a very large area of outlet; and while there is not the slightest risk of down-draught, there is no intrusive interference with the architecture of a building. No turret or cowl of any kind is required. These ventilators have given satisfaction during the past twenty years.

* * *

Fan Notes.

"Fan Notes," setting forth the relative merits of different types of ventilating fans for various classes of work, includes also an instructive and a somewhat piquant controversy on the subject, in which Mr. James Keith, M.Inst.C.E., etc., managing director of Messrs. James Keith and Blackman Co., Ltd., puts forward an able and a convincing vindication of the system in which his firm is interested. The pamphlet is fully illustrated, and contains much information of undoubted value. The pamphlet may be had from the firm's head office, 27, Farringdon Avenue, London, E.C.

Merrywood.—The new elementary school, opened here on Dec. 15th, provides accommodation for 500 scholars, and is the design of Mr. H. Dare Bryan. The school, a special feature of which is the central hall, which has a cross vaulted barrel ceiling, has cost £7,205, and the site, measuring 3,133 sq. yds., £2,000. The various contractors are as follows: Builder, A. J. Colborne, £5,313; plumber, A. S. Scull, £279; heating, W. J. Spry and Co., £338; electric lighting and ventilating, P. Jolin and Co., £206; furniture, R. Palmer, £252.

Federation News.

Scarborough.—The annual dinner of the Scarborough Master Builders' Association was held at the Albemarle Hotel, on December 19. Mr. Oxley Smith presided, and was supported by Mr. R. Watkinson (vice-president), Mr. W. A. Sinclair (representative on the Yorkshire Federation), Councillor G. Mansfield, J.P. (York, ex-president of the Yorkshire Federation), Alderman Maynard, Councillor Moore, Councillor Malton, Mr. G. B. Parker (secretary), and others. Mr. A. W. Sinclair, in proposing "The Yorkshire Federation of Building Trade Employers," said that the one thing which pleased him more than any other was the construction of conciliation boards, which were doing an immense amount of good in every part of the country. It was through the intervention of such boards that strikes and lock-outs did not take place. Mr. Sinclair also referred to the fact that though the building trade was bad in all parts of the country, no society, to his knowledge, had ever reduced the workmen's wages, which he considered showed a good feeling on the part of the employers. Councillor Mansfield (York) responded. Mr. R. Watkinson proposed "The Scarborough Master Builders' Association," and the President responded. Mr. G. B. Parker gave "The Architects and Surveyors," for whom Mr. Caleb Porch replied. Mr. W. Malton proposed "The Municipality and Trade of Scarborough," which was responded to by his brother, and the toast of "The Visitors," was proposed by Mr. R. W. Jowsey, and responded to by Alderman Maynard.

STOCKTON-ON-TEES DISTRICT ASSOCIATION.

Secretary: W. C. Creasor.

The annual meeting of the Stockton-on-Tees and District Association was held December 2nd. The secretary presented his annual report, which dealt with various matters, including Durham County Council Education Committee Building agreement, proposed reduction of wages which was strongly opposed, the adoption of the Builders' Journal as the official organ of the National Federation, and the scheme for regulating payments to sub-contractors.

The balance-sheet, presented by Mr. R. Johnson, treasurer, showed a substantial balance in hand. Four firms were proposed and accepted as honorary members. The election of officers resulted in the re-election of Mr. J. Davison, as president, Mr. W. Colpitts, as vice-president, Mr. R. Johnson, treasurer, Mr. A. J. Cooke and Mr. G. E. Grey, as auditors, and Mr. W. C. Creasor, as secretary.

The levy was fixed at three shillings per cent. on wages paid, minimum 21s. The following were elected after a ballot vote:—Representatives Northern Counties Federation, Messrs. Davison, Johnson, Grey, Taylor, T. Brown and L. Brown. Representatives to Teesside Association, Messrs. G. Nicholson, J. Guthrie, L. Brown, T. Brown, R. Johnson, and W. Doughty. Representatives on Conciliation Board, Messrs. Johnson, Benson and Cooke.

The proposed form of sub-contract was discussed at length, and the matter left for decision at Teesside annual meeting.

It was decided to support Middlesbrough Association in their motion to alter the constitution of Teesside Committee.

Bankruptcies

Avery, J. T., builder, Mere. R.O., Dec. 23. Adj., same day.

Wilkie, R. I., and Herbert Hammond (trading as Robert Wilkie and Co.), builders, Plumtree. First meeting, O.R.'s, Nottingham, Jan. 8, at 11. P.E., Nottingham C.C., Jan. 19, at 10.30.

Ballard, Percy, architect and surveyor, Oxford Buildings, Long Eaton. P.E., Derby C.C., Jan. 19, at 11. Adj., Dec. 14.

Marsh, Tom, builder, Clevedon, Victoria Road, Upper Parkstone. P.E., Town Hall, Poole, Jan. 8, at 11.30. R.O., Dec. 14. Adj., Dec. 15.

Gann, Hugh Mortimer, builder and lead merchant, West Mersea. R.O., Dec. 18.

Sexton, Archibald, builder, West Bergholt. P.E., Law Courts, Colchester, Jan. 22, at 11.30.

Adams, J. W., builder, Markham Road, Bournemouth. P.E., Town Hall, Poole, Jan. 8, at 11.30. R.O., Dec. 18.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Jan. 7. WINDSOR.—Repairing the two Mortuary Chapels, in the Windsor Cemetery, for the Town Council. The specification may be seen and forms of tender obtained upon application at the office of E. A. Stickland, borough surveyor, Alma Road, Windsor. Tenders to be sent in to E. C. Durant, town clerk, 3, Park Street, Windsor, on the forms supplied, and endorsed "Repairs at Cemetery," not later than Jan. 7.

Jan. 7. BRIDLINGTON.—Erection and completion of the Burlington Schools and Caretaker's Residence, for the Borough Education Committee. Drawings, specification, and conditions of contract may be inspected, and bills of quantities and form of tender may be obtained at the office of J. Earnshaw, architect and surveyor, Carlton House, Bridlington, upon payment of a deposit of £2 2s. Sealed tenders, endorsed "Tender for Bridlington Schools, Contract No. 1," to be delivered at the architect's office not later than ten o'clock a.m. on Jan. 7.

Jan. 8. MURLOG (Ireland).—Erection of a schoolhouse at Murlog, Parish of Clonleigh, according to plans and specification prepared by the Commissioners of National Education and the Board of Works, and to be seen at the Parochial House, Strabane. Tenders to be lodged with Rev. John Doherty, P.P., by Jan. 8.

Jan. 9. LLANBRADACH.—Building of a chancel, vestry, and tower at All Saints' Church, Llanbradach, for the Rev. Edwin Edwards. The plans may be seen at the office of E. M. B. Vaughan, F.R.I.B.A., architect, Cardiff, and quantities supplied. A deposit of £2 2s. will be required. Tenders, sealed and endorsed, to be sent to the architect on or before noon on Jan. 9.

Jan. 9. BANDON.—Erection of 143 single cottages, with fencing of an acre plot of land to be attached in every case, at a cost not exceeding £130 per cottage and plot, for the R.D.C. A deposit of £2 per cottage must be lodged with each tender and an official acknowledgment obtained therefor. Conditions of contract and any other particulars required, as well as tender forms, can be had on application from A. Haynes, clerk of District Council, Council Office, Workhouse, with whom tenders should be lodged not later than 11 a.m. on Jan. 9.

Jan. 9. BANDON.—Fencing nine additional half-acre allotments to existing cottages, at a cost not to exceed 12s. 6d. per perch, for the R.D.C. A deposit of 10s. per plot must be lodged with each tender and an official acknowledgment obtained therefor. Conditions of contract and any other particulars required can be had on application to A. Haynes, clerk of District Council, Council Office, Workhouse, with whom tenders should be lodged not later than 11 a.m. on Jan. 9.

Jan. 9. LONG EATON.—Erection of proposed Council Schools at Long Eaton for the Derbyshire Education Committee, to accommodate 960 children in three blocks for boys, girls, and infants, with cookery and manual instruction rooms. Persons desirous of tendering for the work may see the drawings, specification, agreement, etc., at the office of the architect to the Committee, St. Mary's Gate, Derby, between the hours of 10 a.m. and 4 p.m., except on Saturdays when they will be on view from 10 a.m. to 12 noon. A copy of the bill of quantities, specification, conditions of contract and form of tender can be obtained at the architect's office upon payment of £1 1s. Sealed tenders, in envelopes provided for the purpose, endorsed "Tender for Long Eaton School" must be delivered to G. H. Widdows, architect to the Committee, County Education Office, St. Mary's Gate, Derby, not later than Jan. 9, at 1 p.m. Securities required.

Jan. 11. BISHOP AUCKLAND.—Proposed extensions to the Lady Eden Cottage Hospital, Bishop Auckland. Plans and specifications may be seen, and full particulars obtained at the office of F. H. Livesay, architect and surveyor, Bishop Auckland, up to Jan. 11, on or before which date sealed tenders, properly endorsed "Lady Eden Cottage Hospital Extension," are to be sent to Dr. T. A. McCullagh, Bishop Auckland.

Jan. 11. EBBW VALE.—Stripping, boarding, elting and re-slating the roofs of the Victoria Schools, together with various jobbing works, for he Education Committee. Further information may be obtained on application to H. Waters, architect, Market Chambers, Ebbw Vale. A deposit of £1 1s. will be required from all persons making application for schedule. Tenders enclosed in a sealed envelope endorsed on the outside "Tender for Victoria Schools," should be delivered at the office of T. Hughes, secretary, Ebbw Vale, on or before Jan. 11.

Jan. 12. ABINGDON.—Erection of New Station Buildings at Abingdon, for the Directors of the Great Western Railway Co. Plans and specifications may be seen, and forms of tender and bills of quantities obtained at the office of the engineer at Paddington Station, between the hours of 10 a.m. and 4 p.m. Tenders, addressed to G. K. Mills, secretary, Paddington Station, London, and marked outside "Tender for Works at Abingdon," will be received on or before Jan. 12.

Jan. 13. MORLEY.—Alterations and additions to Peel Street Mills, Morley. Plans and specifications may be seen and quantities obtained of T. A. Buttery, F.I.A.S., architect, Queen Street, Morley, on Jan. 6. Sealed and endorsed tenders to be sent to him not later than 4 p.m. on Jan. 13.

Jan. 13. ROTHERHITHE.—Partial reconstruction of and additions to the Desiccated Grains Company's Factory, Rotherhithe. Plans and specifications (no quantities) may be seen on application to the Works Manager at the Company's premises, 199, Rotherhithe Street, Rotherhithe. Sealed tenders, endorsed "Tender, Desiccated Factory," to be delivered before 12 noon on Jan. 13 at the offices of Wreford and Wright, architects, 317, High Holborn, W.C.

Jan. 14. SNEATON, near Whitby.—Alterations in Chancel, for re-seating and other works at the Parish Church of Sneaton, near Whitby. The plans and specifications may be seen at the Architect's office, and persons desirous of tendering for the work are requested to send in their names to E. H. Smales, architect, 5, Flowergate, Whitby, who will furnish them with the bill of quantities when ready; and tenders are to be sent to him before noon on Jan. 14.

Jan. 14. CHESTER.—Building a Battery Room and other extensions at the Electricity Works in New Crane Street. Plans and specifications can be seen at the office of the city surveyor, Town Hall, Chester, and bills of quantities obtained on deposit of £1. Tenders enclosed in sealed envelopes, endorsed on the outside "Tender for Electricity Works Extension," and addressed to J. H. Dickson, town clerk, Town Hall, Chester, are to be delivered not later than 10 a.m., on Jan 14.

Jan. 15. CANTERBURY.—Plastering, repairs, painting, etc., to Ward A2 Male at the Kent County Lunatic Asylum, Chartham Down, near Canterbury. Persons desirous of tendering may obtain a copy of the bills of quantities and see the plans and specifications at the office of W. J. Jennings, architect, 4, St. Margaret's Street, Canterbury, on payment of the sum of £5. Tenders to be sent to the chairman of the Committee on the forms provided, and to be delivered at the asylum not later than 10 o'clock on the morning of Jan. 15.

Jan. 16. BLAINA.—Erection of a new mixed and infants' school at Blaina, to accommodate 510 scholars, for the Monmouthshire Education Committee. Plans and specification may be seen at the County Council Offices, Newport. Quantities supplied on deposit of £3 3s. Sealed tenders, endorsed "Tender, Blaina School," are to be delivered to C. Dauncey, secretary, County Council Offices, Newport, Mon., not later than Jan. 16.

Jan. 16. OLD FLETTON (Hunts.).—Erection of a commercial and technical school at Old Fletton, for the Hunts. Education Committee. Persons desirous of tendering can see plans and specifications at the offices of the County Surveyor, High Street, Huntingdon, and quantities can be obtained on payment of £2 2s. Tenders to be delivered to S G. Cook, clerk to the Education Committee, County Education Offices, Huntingdon, by 10 a.m. on Jan. 16.

Jan. 18. MACCLESFIELD.—Erection of two Detached Blocks for 45 patients each, at the Parkside Asylum, Macclesfield. Plans and specifications can be seen at the office of H. Beswick, F.R.I.B.A., county architect, Chester, on and after December 14, and quantities obtained on deposit of £1. Tenders are to be delivered to A. C. Proctor, clerk to Visitors, 23, King Edward Street, Macclesfield at or before 10 a.m., on Jan. 18, endorsed "Tender for Detached Blocks, Parkside Asylum."

Jan. 18. KINGSTON-ON-THAMES.—Making a small addition to the Union Offices, Coombe Lane, Kingston-on-Thames, for the Guardians of the Kingston Union. Plans and specification may be seen and bill of quantities and form of tender obtained on application to H. Hope, C.E., architect, 12, Clarence Street, Kingston-on-Thames. Tenders to be delivered to C. W. Dash, clerk, Union Offices, Coombe Lane, Kingston-on-Thames, not later than Jan. 18, endorsed "Tender for Additions to Offices." Fair wages clause.

Jan. 18. HUNSLET (Leeds).—Bricklayer's, joiner's, plumber's, plasterer's, slater's and painter's work required in the erection of the Council's new offices in Leek Street, Hunslet, for the R.D.C. Contractors may tender either for the whole or any one of the trades. Application for specifications and quantities, accompanied by a deposit of 10s. 6d., must be made to B. W. Higgins, architect, Oulton, near Leeds, and tenders endorsed "Tender for New Offices," must be sent to W. B. Pindar, clerk, Glasshouse Street, Hunslet, Leeds, not later than Jan. 18.

Jan. 19. SEAHAM.—Erection of Temporary Council Schools at Seaham Harbour, alterations and improvements at Middlestone Moor, South Frosterley, Easington Lane, and Hedley Hill Council Schools. Plans, specifications, and general conditions of contract may be seen and bills of quantities obtained (for Middlestone Moor and Seaham Harbour Council Schools only), at the office of F. E. Coates, Shire Hall, Durham. Sealed tenders (endorsed with name of school) are to be sent to A. J. Dawson, clerk to the Education Committee, Shire Hall, Durham, on or before Jan. 19.

Jan. 19. LONDON, W.—Erection of branch Post Office and Meteorological Office, South Kensington (2nd contract—Superstructure), for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to Sir Henry Tanner, F.R.I.B.A., H.M. Office of Works, etc. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, on payment of £1 1s. Tenders must be delivered before 12 o'clock noon on Jan. 19, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W., and endorsed "Tender for New Branch Post Office, etc., South Kensington."

Jan. 21. LONDON, N.—Provision of improved Receiving Ward accommodation at the St. John's Road Workhouse, Upper Holloway, N., for the Guardians of the Poor of the Parish of St. Mary, Islington, in accordance with plans, specification, and conditions of contract, which may be seen up to Jan. 16, on application to their architect, W. Lockwood, of 12, Sherwood Street, Piccadilly Circus, London, W. A copy of the bills of quantities can also be obtained of him upon depositing £5 5s. Tenders must be sealed up in the envelope supplied, addressed to the Guardians and delivered at the offices of E. Davey, clerk, Guardians' Offices, St. John's Road, Upper Holloway, N., not later than 12 noon on Jan. 21, and the same will be opened at a meeting of the Guardians on the same day. Securities required.

No date. TIPPER.—Erection of a new residence at Tipper, Naas, Co. Kildare. Plans, specifications, etc., may be seen at the offices of G. L. O'Connor, M.R.I.A.I., architect, 42b, Great Brunswick Street, Dublin.

No date. PWLLHELI.—Enlargement of Pwllheli Church. Builders wishing to submit estimates for the work are requested to send their names, with references, to J. Oldrid Scott and Son, architects, 2, Dean's Yard, Westminster, S.W.

ENGINEERING.

Jan. 7. BRIDLINGTON.—Heating the Burlington Schools with hot water (low pressure), for the Borough Education Committee. Drawings, specification, and conditions of contract may be inspected at the office of J. Earnshaw, architect and surveyor, Carlton House, Bridlington, (quantities not supplied). Sealed tenders, endorsed "Heating Contract No. 2," are to be delivered at his office not later than 10 o'clock a.m. on Jan. 7.

Jan. 9. LLANGYNWYD MIDDLE.—Construction of Works of water supply in the parish of Llangynwyd Middle, for the Penybont R.D.C (Bridgend). Plans can be seen and specification, quantities, and forms of tender (which alone must be used) can be obtained from W. J. Davies, surveyor, Felin Fach, Tondu, upon payment of £1 1s. Sealed tenders, endorsed "Llan Water Works," to be received by R. H. Cox, Union Offices, Bridgend, not later than Jan. 9.

Jan. 9. BLEAN (Canterbury).—Supply of an eight nominal horse-power, horizontal, non-condensing steam engine, on strong box-girder bedplate, with necessary holding-down bolts and plates, high speed governors, sight-feed lubricator on steam cylinder, feed pump, starting valve, regulating valve, and all bearings to be fitted with gunmetal oil cups, for the Guardians. Also one "Royle" feed-water heater, the whole to be supplied and delivered, free of charge, to the Guardians at the Workhouse, Herne Common, near Herne Bay. Any further information required may be obtained of the Master of the Workhouse. Tenders and drawings to be delivered at the office of J. E. Burch, clerk, 39, Castle Street, Canterbury, by Jan. 9.

Jan. 18. GLASGOW.—Construction of the Works in the Counties of Stirling and Perth, authorised by the Glasgow Corporation (Water and General) Order, for raising the level of Loch Arklet and conveying water therefrom to Loch Katrine. Copies of the specification, schedule of quantities, and form of tender, together with prints of the drawings, may be obtained from J. R. Sutherland, the engineer to the Water Department, 45, John Street, Glasgow, upon payment to the Water Treasurer, 45, John Street, Glasgow, of £10 10s. The resident engineer will meet intending contractors on the site of the works, at 10 a.m. on Jan. 6 and 7. Sealed offers, marked "Water Department—Tender for Loch Arklet Works," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, on or before 12 o'clock noon, on Jan. 18.

Jan. 19. LONDON, W.—Altering Lifts and Fans at present worked by continuous current lifts and 2 fans to work from single-phase alternating current and 2 fans to work from steam engine. Schemes and tenders are invited by the Parish of Hammersmith. Firms tendering to specify what allowance they are prepared to make for present transforming plant and continuous current motors. Drawings, detailed specifications, etc., to be supplied free of cost to the Guardians. Tenders, endorsed "Tender for Altering Lifts, etc.," to be delivered before Jan. 19, to J. Lamb, clerk to the Guardians, 206, Goldhawk Road, Shepherd's Bush, from whom specification can be obtained.

Jan. 20. CAIRO.—Supply of a universal milling machine (machine à fraiser) required by the Khedival School of Arts and Trades. Tenders must be made on stamped paper of 3 Egyptian piastres (obtainable from Lt.-Colonel Western, C.M.G., Queen Anne's Chambers, Broadway, Westminster, S.W.), and should be accompanied by full particulars and plans, etc., of the machine offered. They should be addressed to the Director of the School of Arts and Trades, Cairo, where they will be received up to noon on Jan. 20. Tenders should be endorsed "Offre pour fourniture d'une machine à fraiser." The copy of the specifications and conditions mentioned above (in French) may be examined by British makers on application at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Jan. 26. LONDON, S.W.—Laying of stoneware cable-ducts, for the L.C.C. Full particulars, and also information as to the conditions to be observed by tenderers, will be found in the "London County Council Gazette" of Jan. 4 and subsequent issues. Tenders must be upon the official forms to be obtained from the clerk of the Council, County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of the sum of £2 for the specification, etc. Full particulars of the work may be obtained on application at the County Hall, before the payment of the fee for the specification, etc. No tender received after 11 a.m. on Jan. 26. will be considered.

March 1. CAIRO.—Construction of a floating dock for the Administration og the Egyptian State Railways. Specifications, price 10s., may be obtained from Lt.-Colonel Western, C.M.G., Queen Anne's Chambers, Broadway, Westminster, London, S.W. Tenders will be received by the General Manager, Egyptian State Railways, Cairo, up to noon on March 1

IRON AND STEEL.

Jan. 7. MANCHESTER.—Erection of Iron Railings and Fencing at Hulme Hall Lane, Ten Acres Lane, and Manley Park Recreation Grounds, for the Parks and Cemeteries Committee. Drawings may be seen and specification, bill of quantities, and form of tender obtained on application at the City Surveyor's office, Town Hall, Manchester, on payment of £2 2s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelope, addressed to the chairman of the Parks and Cemeteries Committee, are to be delivered at the city surveyor's office not later than 10 a.m. on Jan. 7.

Jan. 11. NEW MALDEN.—Supplying and Erecting about 581 yds. lin. of Unclimable Iron Fencing, together with 3 pairs of gates, on the Fencing Recreation Ground, Station Estate, New Malden, in accordance with plans and specification prepared by R. H. Jeffes, engineer and surveyor to the Council. The plans and specification can be seen and bills of quantities obtained on application to the surveyor during office hours, upon deposit of the sum of £4 4s. Sealed tenders, endorsed "Fencing Recreation Ground," and addressed to J. W. Johnson, clerk to the Council, Council Offices, New Malden, Surrey, to be delivered not later than 6 p.m. on Jan. 11.

Jan. 12. BARNSLEY.—Supply of about 1,600 yds. of 20in. diameter Cast Iron Socketted Pipes and Special Castings for the Town Council. The drawings can be seen and the specification, conditions, and bills of quantities may be obtained on application to J. H. Taylor, borough surveyor, engineer for the Works, Manor House Offices, Barnsley, on payment of £3 3s. to J. F. Burn, borough accountant, Manor House Offices, Barnsley. The tenders are to be delivered, properly endorsed, to H. Horsfield, town clerk, Church Street, Barnsley, not later than 10 a.m. on Jan. 12.

Jan. 16. SOUTHGATE.—Supply and delivery of 260 yds. of unclimbable iron fencing. Specification and full particulars can be obtained from C. G. Lawson, the council's surveyor, at the Council Offices. Sealed tenders to be delivered to W. M. Ellenor, clerk, Council Offices, Palmer's Green, N., not later than Jan. 16.

Jan. 19. ADELAIDE (South Australia).—Supply and delivery of 4,200 tons of steel rails, 80lbs. per lin. yd.; 1,500 tons of steel rails, 60lbs. per lin. yd.; 1,900 tons of steel rails, 50lb. per lin. yd.; 286 tons of steel fishplates for 80lb. rails; 100 tons of steel fishplates for 60lb. rails; and 120 tons of steel fishplates for 50lb. rails. Drawings and specification can be seen, and forms of tender obtained, at the Supply and Tender Board Office at Adelaide, where copies of drawings and specifications may be purchased at 10s. per set. Drawings and specification may also be inspected at the office of S. E. Strickland, the South Australian Inspecting Engineer in London, 64, Victoria Street, S.W. Tenders should be endorsed "Tender for Rails and Fishplates," and delivered to the Supply and Tender Board Offices, Adelaide, by 3 p.m. on Jan. 19.

Jan. 26. BELFAST.—Supply and Delivery in the Permanent Way Yard, Duncrue Street, Belfast, for the Midland Railway, of (a) Fish-plates, and (b) Bottom Plates:—(a) 32 tons of section 40, weight per pair 14lb. to 16lb. (approx.), cut to specified lengths; 50 tons of section 42, weight per pair 18lb. (approx.).; 59 tons of section 46, weight per pair 15½lb. (approx.); and alternatively for half of each of above quantities, with, in addition, 150 tons of section 65, weight per pair 50lb. (approx.); (b) 25 tons of 8in. by 8in. plates; 25 tons of 9in. by 7in. plates, and alternatively for half of each of above quantities. The whole to be of British manufacture throughout. Copies of the drawings (a and b) and forms of tender can be obtained from J. Cowie, secretary of Committee, York Road Terminus, Belfast. Proposals to be sent in sealed envelope, endorsed "Tender for Fish-plates, etc.," and addressed to the chairman of Committee at Belfast, so as to be with him on or before Jan. 26.

PAINTING.

Jan. 13. LEEDS.—Painting, etc., the exterior of property in Trafalgar Street, Nile Street, etc. The specification may be seen and forms of tender obtained at the office of W. T. Lancashire, city engineer, in the Municipal Buildings. Tenders, properly endorsed, must be received at the town clerk's office not later than 10 a.m. on Jan. 13.

Feb. 2. MANCHESTER.—Painting at the under-mentioned places, for the Directors of the Lancashire and Yorkshire Railway. 1, from Southport (Central) to Preston; 2, Wigan to Southport; 3, at Blackburn; 4, Burnley to Todmorden; 5, at the carriage and waggon works, Newton Heath; 6, Newton Heath to Rochdale, and the Middleton branch; 7, Rochdale to Sowerby Bridge; 8, Sowerby Bridge to Mirfield and at Dewsbury Junction; 9, at Bradford; 10, at Hull. Specifications and separate forms of tender may be obtained on personal application at the engineer's office, Hunt's Bank, Manchester. Tenders, endorsed "Tender for Painting," to be in the hands of R. C. Irwin, secretary, Hunt's Bank, Manchester, not later than 10 o'clock on the morning of Feb. 2.

PLUMBING & SANITARY

Jan. 11. NEW MALDEN.—Constructing about 879ft. run 9in. and 802ft. run 12in. Pipe Sewer, together with manholes, ventilating shafts, etc., in Kingston Road, New Malden, for the Maldens and Coombe U.D.C., in accordance with plans and specification prepared by their engineer and surveyor, R. H. Jeffes. The plans and specification can be seen, and bills of quantities obtained on application to the surveyor during office hours, upon deposit of the sum of £5 5s. Sealed tenders, endorsed "Sewer—Kingston Road," and addressed to J. W. Johnson, clerk to the Council, Council Offices, New Malden, Surrey, to be delivered not later than 6 p.m. on Jan. 11.

Jan. 12. BARNSLEY.—Excavating, Laying, and Jointing of about 1,600 lin. yds. of 20in. diameter Cast Iron Socketted Pipes and Special Castings, and for the driving of headings and the construction of a tunnel and screening chambers, sewage well, brick sewers, and other works connected therewith for the Town Council. The drawings can be seen and the specification, conditions, and bills of quantities may be obtained on application to J. H. Taylor, borough surveyor, engineer for the Works, Manor House Offices, Barnsley, on payment of £3 3s. to J. F. Burn, borough accountant, Manor House Offices, Barnsley. Tenders, properly sealed and endorsed, are to be delivered to H. Horsfield, town clerk, Church Street, Barnsley, not later than 10 a.m. on Jan. 12.

Jan. 13. SELLY OAK. — Re-drainage of the houses numbered 11 to 20, Lime Avenue, Dawlish Road, Selly Oak, and 133a, Dawlish Road, Selly Oak, for the King's Norton and Northfield U.D.C. Forms of tender and specification of the work may be obtained from A. W Cross, A.M.I.C.E., 23 and 25, Valentine Road, King's Heath. Tenders, endorsed "Tender for Re-drainage of Lime Avenue, Selly Oak," to be received at the office of E. Docker, clerk to the Council, 10, Newhall Street, Birmingham, not later than 10 o'clock in the forenoon on Jan. 13.

Jan. 15. BELFAST.—Carrying out a scheme of sewerage and sewage disposal works for Glengormley, Whitewell, Ballygolan, and Upper and Lower Whitehouse, for the R.D.C., in accordance with plans and specification which can be seen at the office of J. W. Robb, clerk to the R.D.C., Council Office, Union Workhouse. Bills of quantities, etc., can be purchased at this office at a cost of £1 1s. per copy. Tenders to be lodged in the tender-box, Council Office, Workhouse, Belfast, before 2 o'clock p.m. on Jan. 15. Securities required.

Jan. 18. THURNSCOE.—Alterations and improvements at the Thurnscoe Sewage Disposal Works, comprising secondary contact beds, sludge well, sludge filters, storm water carrier, and laying out land filtration area, for the U.D.C. Plans and specifications may be seen, and quantities obtained from H. Smith, engineer, Compton Buildings, Bow Street, Keighley. Plans, sections, and specifications of the work can be seen and a form of tender with quantities, and any further information obtained from the surveyor to the Committee, Town Hall, West Didsbury. Tenders to be endorsed "Tender for Street Works," and to be addressed to the chairman of the Withington Committee, Town Hall, West Didsbury, not later than noon on Jan. 8.

Jan. 11. BOGNOR.—Supply of 100 tons of 1½ in. broken granite, delivered at Bognor Station, for the U.D.C. Tenders, endorsed "Tenders for Granite," must be delivered on or before Jan 11 to H. L. Staffurth, clerk, Council Offices, Bognor.

Jan. 11. LEEDS.—Taking up of the old pavers to the main roadway in the workhouse grounds, and for relaying the same as a tar macadam road, for the Guardians of the Leeds Union. Contractors desirous of tendering for this work must forward their applications to T. Winn and Sons, architects, 84, Albion Street, Leeds, on or before Jan. 11, when copy of schedule quantities will be duly forwarded.

Jan. 11. BEAUFORT.—Excavating, ballasting, and asphalting the playgrounds at the Rassau Schools, Beaufort, together with certain drainage works and boundary walls, the whole to be let in one contract, for the Ebbw Vale Education Committee. The drawings and specification may be seen at the office of H. Waters, Committee's architect, Market Chambers, Ebbw Vale. Tenders endorsed on the outside "Tender for Rassau School," should be delivered at the office of T. Hughes, secretary, Ebbw Vale, on or before Jan. 11.

Jan. 11. LEEDS.—Paving and flagging of the following streets, for the Highways Committee: Hessle Mount, back Hessle Terrace, back Hessle Avenue, Hessle Terrace, back Thornville Row, Royal Park Road, back Meadow View, Sheepscar Avenue, and Trafalgar Row. Drawings may be seen at the city engineer's office, Municipal Buildings, Leeds. Forms of tender and bills of quantities may be obtained, and copies of the documents forming the contract inspected on application at the Highways Office, 155, Kirkstall Road. Sealed tenders, endorsed "Tender for private street works," and addressed to the Highways Committee, must be delivered at the town clerk's office, Town Hall, Leeds, not later than 10 a.m. on Jan. 11.

Jan. 11. LONDON, N.W.—Supply and execution of the following for one year commencing April 1, for the St. Pancras B.C.:—(1) Removal of road-sweepings and gully soil; (4) Cartage; (5) Timber and joinery materials; (7) Paints; (8) Oils; (11) General ironmongery; (12) Tools and other hardware goods; (13) Yorkshire stone and artificial paving slabs; (14) Granite kerbs, paving setts, broken granite and Kentish rag; (15) Gravel and other roadway materials; (16) Sundry materials (lime, cement, bricks, stoneware pipes, and other glazed goods); (19) Pitch, tar, creosote oil, carbolic powder. Tenders under endorsed covers (supplied) to be delivered at the office of the Department of Works at the Town Hall, Pancras Road, N.W., not later than 12 o'clock noon, on Jan. 11. No tender will be considered unless made out on one of the printed forms, without any alteration thereof, which, with any further particulars, can be obtained on application to W. N. Blair, borough engineer and surveyor, up to the morning of Jan. 11.

Jan. 12. BOSTON.—Supply of 11,182 tons of granite and 1,286 tons slag (more or less) during 1909, for the R.D.C. Forms of tender, which must be completed and returned by the first post on Jan. 12, can be obtained from H. Snaith, clerk of the Council, 10, New Street, Boston.

Jan. 16. NEWCASTLE.—Supply and Delivery at the Newcastle Quay of 500,000 Wood Blocks. Prices for any suitable timber in blocks, either solid or prismatic, will be considered on payment of £1 1s. to the City Treasurer, Town Hall, Newcastle. Forms of tender and other particulars can be obtained at the city engineer's office, Town Hall, Newcastle. Tenders, marked "Wood Paving" on left-hand corner of envelope, and addressed to the city engineer, Town Hall, Newcastle-upon-Tyne, will be received up to noon on Jan. 16.

Jan 18. TEMESVAR.—Necessary work, Asphalt and otherwise in the general canalisation of the town. It is proposed to spend about 4.3 million kronen on the canalisation. About 3.3 millions of this sum will be devoted to the work for which tenders are asked. The plans, as well as all other details, can be seen at the town office of engineers, where also for the sum of 100 kronen all necessary papers for tenders for the work in question are to be had, printed in Hungarian. Tenders will be received up to Jan. 18, by the Magistracy of Temesvar, Temesvar, Hungary.

Jan 19. MIDHURST.—Supply of Quartzite, Granite, Tarmacadam, for the R.D.C. Form of tender to be obtained of A. G. Gibbs, surveyor to the Council, Council Offices, Midhurst, Sussex. Sealed tenders, endorsed "Road Material," to be delivered to him not later than Jan. 19.

Jan. 19. CHISLEHURST.—Supply of Broken Granite, Granite Kerb and Setts, Tar-paving and Tar, for one year from April 1. Particulars, together with forms of tender, may be obtained on application being made at the Council offices. Tenders, endorsed "Tender for ——" (as the case may be) must be delivered to H. E. Knight, clerk, not later than 4 o'clock p.m., on Jan. 19.

Jan 20. BEXLEY.—Supply of Broken Stone, to be delivered between April 1, 1909, and March 31, 1910, for the U.D.C., as follows:—(1) 1,600 tons (more or less) of Guernsey granite; (2) 840 tons (more or less) of Quenast granite; (3) 1,500 tons (more or less) of dug pit flints; (4) 150 tons (more or less) of tarred granite macadam. Specification and form of tender can be obtained upon application to W. T. Howse, surveyor to the Council. Sealed tenders, endorsed "Tender for Road Metalling," must be sent to T. G. Baynes, clerk to the Council, Council Offices, Bexley Heath (upon the prescribed form) not later than 10 a.m. on Jan. 20.

Jan. 23. SLEAFORD.—Supply of about 10,000 tons of X and XX granite, and about 10,000 tons of slag and 200 tons of gravel for paths, for the R.D.C. The material must be delivered carriage free at any railway station within the district, as set out in the form of tender. Specifications and forms of tender may be had on application to E. Clements, clerk to R.D.C., 74, Southgate, Sleaford, on enclosing a fully stamped addressed foloscap envelope. Tenders to be sent in by Jan. 23, marked "Tenders for Slag or Granite," in separate envelopes.

MISCELLANEOUS.

Jan. 8. MANCHESTER.—Supply and Delivery of the Fireclay Goods required during next season by the Gas Committee, at their several Gas Works. Full particulars and forms of tender may be obtained from C. Nickson, superintendent, at the Gas Offices, Town Hall, Manchester, on payment of a deposit of £2 2s. Sealed tenders, endorsed "Tender for Fire-clay Goods," addressed to the chairman of the Gas Committee, must be delivered at the Gas Offices, Town Hall, Manchester, on or before Jan. 8.

Jan. 11. EAST STONEHOUSE.—Supply and delivery of the following, for period ending Dec. 31, 1909:—Ordinary stock bricks; Portland cement; Lias lime; white lime; building stone; tar; stoneware pipes; granite kerbing, channelling, and setts; granite chippings; cast iron gullies, hydrant frames and covers, meter frames and covers, valve blocks and covers, stop cock blocks and covers, manhole frames and covers; blue elvan for road metalling. Forms of tender and specifications of the whole of the above materials may be obtained on application to C. H. Trounce, surveyor, Townhall, East Stonehouse, Devon. Sealed tenders, marked "Tenders for Materials," are to be delivered at his office before twelve o'clock noon on Jan. 11.

Jan. 14. HAMPSTEAD, N.W.—Works, materials, or services, for one or three years, at the option of the B.C., from April 1:—(3) York flags, (4) artificial flags, (5) granite kerb and setts, (6) broken granites and basalt, (7) road materials, (8) Thames ballast and sand, (9) lime, cement, and bricks, (10) wood-paving blocks, (11) drain pipes, (13) ironmongery, tools, etc., (14) iron castings, (21) tar paving, (22) tar macadam, (23) pitch, tar, and creosote oil. Full conditions are contained in the forms of tender, which may be had, and further particulars obtained, on application to the borough engineer at the Town Hall. No tender will be received unless on the official form. Tenders to be delivered at the office of A. P. Johnson, town clerk, Town Hall, Haverstock Hill, N.W., before 4 p.m. on Jan. 14.

Jan. 18. PLYMOUTH.—Supply of the following goods and materials for one year, from April 1, for the B.C.:—(3) Paints, (5) ironwork, (11) iron, steel, bolts and nuts, (15) Portland cement, (17) tar and pitch, (23) wood blocks, (24) creosote, (27) road metal, (29) granite kerbs, setts, etc., (30) white lead, red lead, linseed oil and turpentine. Tender must be based on the whole of a schedule (with the exception of schedule No. 29), and not on any particular item contained therein. Schedules may be obtained on payment of a deposit of £1 in cash for each schedule. Tenders to be delivered not later than 5 p.m. on Jan. 18, addressed to J. Paton, borough engineer and surveyor, Municipal Offices, Plymouth.

Jan. 20. BEXLEY.—Supply and Delivery of best Portland Cement, Manhole Covers and Frames, and Gulley Grates and Frames for the year ending March 31, 1910, for the U.D.C. Specification and form of tender may be obtained upon application to W. T. Howse, surveyor to the Council. Sealed tenders, endorsed "Tender for Stores," must be sent to T. G. Baynes, clerk to the Council, Council Offices, Bexley Heath, not later than 10 a.m. on Jan. 20.

QUANTITY Surveyor's Assistant (21), 4 years' experience, desires engagement, certificates and good references. — Apply Box 4745, Builders' Journal Office.

QUANTITY Surveyors.—A builder wishes to place his son (18) in above office; has had some experience. No premium, but can introduce business.—Apply H., Ashford House, Wimbledon Common. 4686

REINFORCED concrete foreman, disengaged, long and varied experience, especially in Kahn bars and expanded metal, timbering a speciality; carpenter by trade; good refs.—G. C., 59, University Road, Tooting, London. 4721

SLATE MERCHANTS AND BUILDERS' MERCHANTS.—Experienced traveller (with 14 years' connection Midlands), desires re-engagement; at liberty middle of December; or could arrange earlier.—Address, Slate, c/o Secretary, Builders' Exchange, Sheffield. 4624

SLATING and tiling wanted (labour only) day or piece; any quantity, large or small; distance no object.—Mack, Slater and Tiler, 3, Granville Cottages Tower Hamlets Street, Dover. 4619

SHOP or General Foreman, long West-end experience, used to alterations and repairs; understands stairs; used to good jobbing work. Address A., c/o Mr. Seymour, 14, Allsop Place, Regent's Park, N.W. 4586

TO Builders.—Situation as improver wanted by young man just out of his time; technical student; neat draughtsman; assist with quantities, supervision, etc.; abstainer. — Box 4662, Builders' Journal Office.

TO Estate Owners.—Builder (38), varied experience, desires position as agent or clerk of works, surveys, plans, quantities, setting out, accounts and supervision; country preferred.—Box 4591, Builders' Journal Office.

TRAVELLER.—Architect desires post as representative to good firm. — Address Box 4497, Builders' Journal Office.

Appointments Vacant.

BUILDER'S Clerk, experienced and relable; estimates, accounts, usual office routine; preference to Welshman; state age, salary, and references.—Apply Glamorgan, Box 4764, Builders' Journal Office.

BUILDER'S Assistant required in West Country office; knowledge of drawing, quantities, typewriting; excellent opportunity to learn business; cyclist; state full particulars and salary.—Box 4770, Builders' Journal Office.

CLERK required by architect, typewriting and shorthand; state experience and salary.—Box 4754, Builders' Journal Office.

WANTED, immediately, a first-class active all-round architect's assistant, with considerable experience in public, elementary, and secondary school planning. He must also be an expeditious draughtsman, capable of writing specifications and checking accounts. Preference given to one capable of preparing a complete bill of quantities (London system), up to at least £10,000. Salary not to exceed three guineas per week, payable monthly. Apply stating full particulars and testimonials (copies) to D. Pugh - Jones, County (School) Architect, 62, Charles Street, Cardiff. 4733

Concerning Competitions. The resolution, moved by Mr. Gammell at the recent meeting of the R.I.B.A., requesting the Council to give effect to the will of the members of the Institute as expressed by a former resolution (under which the system of limited competitions was deprecated), revives a time-honoured controversial question connected with the conduct of architectural competitions, viz., "Should they be thrown open to all, or should they be restricted to the few?" Frankly, although, until recently, we have been staunch supporters of the open competition system, we are now quite undecided as to which of the two methods is the more likely to advance the art of architecture. *Theoretically*, it is only right and fair that the young and untried architect, who is struggling for recognition, should be allowed an opportunity of exhibiting his powers by submitting designs, and winning prizes, for important public buildings, even although he may be incapable of carrying them out in a thoroughly satisfactory manner. But, having regard to the fact that the average assessor is often unable to understand and appreciate either the true principles of design or the geometrical characteristics of correct planning, we are beginning to doubt whether, under either system of competition, the result of his judgment is likely to lead to any great advancement in the art of architecture as it is now understood and practised in this country. Thus, in an open competition in which unscholarly designs submitted by young and inexperienced architects are bound to exceed in number those emanating from older competitors, the probability of a bad award amounts, in these days, almost to a certainty. With regard to a limited competition, the chances that a suitable design may be selected are somewhat greater, because in this case the competitive drawings adjudicated upon by the assessor are likely to be, in the main, the work of architects of greater skill and experience. In other words, as a general rule in an open competition designs of an unscholarly type of architecture will predominate, and those of a more architectural character be in a minority; whereas in a limited competition, the relative positions of the two classes of design will be reversed, and thus the assessor's award is less likely to be governed by his personal predilection for work designed in a style which, naturally, often commends itself to a badly trained and imperfectly educated man. Let us take as a concrete example the recent open competition for the Glamorgan County Hall, with reference to which a very able letter appeared in the correspondence columns of last week's issue of THE BUILDERS' JOURNAL. In this case, as our correspondent points out, "architecture had nothing to do with the award," and with this, and many other remarks contained in his letter, we are in hearty agreement. On December 23rd we published illustrations of the three designs to which the premiums were awarded. The planning of the successful competitors exhibits that want of real knowledge of the essentials of architectural design to which we drew attention in the case of the selected scheme for the London County Hall. In both cases the badly arranged fenestration and the inadequacy of the inner areas for light and air betray the novice and the imperfectly trained architectural tyro. Indeed, in the selected design for the Glamorgan County Hall, the sash windows appear to be placed without the slightest regard to the internal aspect of the rooms in which they occur, and inner walls, or partitions, occasionally "finish" against them in some mysterious manner which is not quite apparent from the drawings. As an effort in serious architectural design the elevations are altogether beneath criticism. Passing, without comment, the second premiated design, let us turn to that which received the third premium and note the far more scientific and symmetrical planning of the experienced competing architect. Although it is well known that designs of a higher order of architectural merit than those to which the premiums were awarded were submitted in this competition, yet a comparison between the premiated ones is, in itself, sufficient to illustrate our point, viz., that in competitions limited to architects of experience the designs submitted would be likely to attain a higher standard of architectural merit than those obtained through the medium of an open competition. Of course, under either system, there is the same difficulty with regard to the vagaries of the assessor, but it is unlikely that awards would be so consistently bad if the proportion of the unscholarly designs received amounted only to a small percentage of the total number submitted in the competition. It is true that the supporters of the open system of competition can point, with pardonable pride, to St. George's Hall, Liverpool, as being the result of a competition won and, practically, carried to a successful issue, by a young and untried man. But they must, however, not lose sight of the fact that Elmes, at the time he won the competition, was fresh from his classic studies in Greece and Rome, and that, in his time, the possession of architectural scholarship was not detrimental to professional success. On the contrary, the accurate knowledge of his art displayed by his competitive drawings was instrumental in affording him the opportunity of producing one of the very best examples of modern architecture.

The Decay of Apprenticeship. The question of apprenticeship is frequently mentioned and sometimes discussed, at meetings of the federated building trade employers; and we now note a reference to the subject in the monthly report, published in the Federation section of the present issue, from the National secretary. It is there remarked that most of the evils from which French master builders are at present suffering arise from the decay of the apprenticeship system. The immediate results of this decline we suppose to be bad workmanship and bad feeling. The supply of competent and trustworthy craftsmen is not being maintained. In this country the dearth is less conspicuous, and the defects are less pronounced, especially in the moral point of view. Our men have not yet brought wanton *sabotage* to the perfection of a fine art, and would certainly shrink from the excesses in that direction with which French employers credit their men; *sabotage*, as far as we can make out, being the deliberate scamping of work in such a manner as to give the utmost inconvenience to the employers against whom they harbour grievances. This manifestation of criminal ill-feeling is, it may be imagined, a modern growth, consequent on the estrangement between master and man that was impossible under the old apprenticeship system, in which the relationship of master and apprentice was in many instances almost that of father and son. The small man often worked at the same bench, and sat at the same table, as his apprentice. The mutual sympathy thus engendered there is in these days but little to foster. The apprenticeship system began to die out with the small master. Big firms did not care to be bothered with apprentices, or, having bound them, took no personal interest in them. The system became obsolescent. We are inclined to think that the attempt to revive it is not likely to be successful, the conditions in which it flourished being so greatly changed. It seems necessary, however, to devise some system of maintaining and raising the standard of efficiency, and the ways and means of effecting this object have yet to be discussed and determined. If the federated employers and the various trade unions could in conference evolve a satisfactory scheme for educating the craftsman, they would render the nation a service by showing the way to all the other industries, which at the present moment are equally deploring the decay of apprenticeship and the absence of an adequate substitute. But the whole question ought to be dealt with on a still broader basis. It is a national concern of vital importance.

Pap with a Hatchet. Mr. P. G. Konody has been "searching for signs of progress in municipal architecture." He has looked for them (perhaps with a Diogenes lantern) in London, Birmingham, Liverpool, Manchester, and Bristol, and "found little to encourage" him. "And then I went to Cardiff." Here, it seems, he found encouragement in the series of "monumental edifices—City Hall, Law Courts, University, and so forth." The citizens of Cardiff are availing themselves of "one of those rare opportunities which occur perhaps at intervals of centuries," as when Heré and Lamour beautified Nancy, or when Schmidt, Hansen, and Hasenauer created the Ringstrasse at Vienna, and the good beginning with the new city hall and the law courts, whose architect was "inspired no doubt by the glories of Nancy," "should make Cardiff the architectural show-place of England." That satirical correspondent who, in criticising in our columns last week the designs for the Glamorgan County Hall, referred to "the style of Queen Anne or of Mary Anne," should rejoice to add to his list "the glories of Nancy," as reflected in far Cathays Park. Mr. Konody, feeling that "architectural jingoes and revilers of the Ritz Hotel" will object to the essentially French character of the two buildings at Cardiff, reminds them that, "save in domestic and ecclesiastic architecture, there has never been a national English style, and that it is no worse to turn to French than to Greek or Italian examples. The greatest English architects based their styles upon foreign architecture—Inigo Jones upon Palladio, and Wren upon French modifications of the Italian Renaissance; while Cockerell explored classic soil for his inspiration. Indeed, the best public buildings in England have always been intelligent adaptations of 'foreign' styles, originality being shown merely in details and in novel combinations of old motives." The "architectural jingoes and revilers," on being offered this milk for babes, may well recall the striking title of an old polemical pamphlet—"Pap with a Hatchet." But at length his secret is out. He is apparently incapable of admiring any building that does not show French influence. This want of catholicity of taste is a measure of his value as a critic of architecture, making quite obvious the reason why, in his peregrinations, he finds so little to praise and so much to blame. If, as Froude learnt history by writing it, Mr. Konody, in the fulness of time, acquires greater breadth of view and more judicial discrimination in architectural values, he will probably be sorry to have slighted or disparaged much meritorious work to which his present bias seems to make him blind. He will then find more "to encourage" him; and he will be in a position to discard both his hatchet and his pap.

The Royal Gold Medal. The selection of a suitable recipient for the Royal Gold Medal, annually conferred by the Royal Institute of British Architects upon some distinguished architect—man of science or letters—is becoming one of great and ever-increasing difficulty. Last year the medal was awarded to the well-known French architect, Monsieur Honoré Daumet, and, in the natural course of events, in this year of grace 1909, the distinction should, presumably, fall upon an Englishman. But what architect, or architectural writer of the day, eligible, in other respects, for the honour, is either capable of designing buildings of pre-eminent architectural merit, or of producing literary effusions, of transcendental value, "tending to promote or facilitate the knowledge of architecture or the various branches of science connected therewith"? In the early days of the Institute—prior to the general disappearance from the ranks of the architectural profession of men of culture, scholars and gentlemen—there was little or no difficulty in selecting a man judged worthy, by universal consent, to receive this, the highest honour it is in the power of the R.I.B.A. to bestow. On referring to the now somewhat lengthy list of the past recipients of the Royal Gold Medal, it appears that the first architect thus distinguished (as far back as 1848) bore the honoured name of Charles Robert Cockerell, and the infallible test of time has amply justified the wise choice, made by the then governing body of the premier architectural society, in favour of this highly cultured and gifted man. Again, when two years later the distinction fell to Sir Charles Barry, the selection was an almost equally happy one, and amongst other worthy recipients of the Royal Gold Medal we may mention James Fergusson (1871), George Edmund Street (1874), and Charles Garnier (1886), each of whom was conspicuous, in his day, for eminent services rendered to the art of architecture. But, on the other hand, it is disappointing to notice that, in some instances, the wisest and best possible selection was certainly *not* made. Indeed, when the architectural output (of one after another) of the men selected on various occasions for this special distinction is recalled, charity compels us to conceal our indignant feelings by saying, with Moliere, "que diable allait-il faire dans cette galère?" We repeat what, in effect, we have said many times before, *viz.*, that no architect is worthy to become the recipient of the Gold Medal of the Institute unless his buildings possess that lasting quality of design which Sir Christopher Wren described as "the attribute of the eternal," and, in view of the unscholarly productions of the majority of the architects of to-day, we sympathise with the members of the Council of the Royal Institute of British Architects upon the manifold difficulties of the task upon which they will shortly be engaged. If it be true, as Wren insisted, that architecture aims at "eternity," and should be "incapable of new fashions," then, as he also remarks, an architect should not only have regard to the judgment likely to be passed on his work by contemporary opinion, but also endeavour to anticipate and provide against the criticism of those who live centuries after him; and if this be true of the architect, there can be no question that the fact should be borne in mind by those called upon to assess the artistic value of current architectural work, and it thus becomes the bounden duty of the Council of the R.I.B.A. to adopt a wise and far-seeing policy with regard to its choice of recipients of the Royal Gold Medal.

Recreation and Education. Some very weighty reasons for not allowing a surveyor to take three or four pupils on to a recreation ground to give them lessons were adduced by the chairman of the Bromley Town Council Recreation Grounds Committee. The surveyor had asked for permission to do this on Mondays, Tuesdays, Thursdays, and Fridays. An alderman, boldly discarding the traditions of his dignity and insignia, asked why this innocent request was refused. "It was a public ground," he said, "and it appeared to him that if he or anyone else desired to go there with a sextant, a chain, or a theodolite, there was no objection to it. He did not see why it could not be done without asking permission." The disgusted surveyor must now regret his fatal exhibition of politeness. These arguments were remorselessly hurled at him from the chair: "In the first place, the ground was for the purposes of recreation, and not for education. In the second place, the surveyor was not a ratepayer, neither were the pupils whom he proposed to bring down ratepayers." These noble sentiments and irrefragable arguments were irresistible. Not another word was said. Opposition was pulverised. Recreation grounds are not to be turned to the base uses of education—except by ratepayers.

"Out of Print." It is even as we said. Our Special Issue at once ran out of print. Anticipating a large demand, we printed an issue greatly in excess of that which had been found inadequate with the preceding Special. But, as we stated some weeks before publication, we were sure that, nevertheless, the supply would be at once exhausted. The question naturally arises, "Why, then, did we not provide for a larger supply?" The explanation is simple. That which is foreseen is not always remediable. By the time we knew for certain that the number ordered would be insufficient to meet the demand, the earlier sheets of the issue had been printed off, and the order could not be increased. We are sincerely sorry that so many readers have been disappointed in their efforts to secure copies; and the applications which could not be supplied have been so numerous as to extort an apology from our publisher. While joining in his expression of regret, we cannot conceal our satisfaction at this most gratifying appreciation of our labour and enterprise. While we are upon the subject of the JOURNAL, we may be pardoned for drawing attention to the change that has been made in the wrapper. The lettering has been re-drawn in a style that is more purely artistic, and in order to give it full effect, we have removed the advertisements that formerly filled up the front page of the cover.

COMPOSITION OF CONCRETE AND BRICKS.*

By H. D. Searles-Wood, F.R.I.B.A.

Concrete Aggregates.

Some interesting results as to the relative strength of concrete made with aggregates of broken brick and gravel respectively, and also with broken brick and gravel mixed in varying proportions, have been obtained from experiments instituted by H.M. War Department in connection with the construction of a large building, for which it was calculated that a maximum weight of two tons per foot super. would be brought upon the concrete foundations.

The experiments were carried out by means of cubes of concrete 1ft. by 1ft. by 1ft., mixed and put together under precisely the same conditions as occur in actual practice. The aggregate of broken brick or gravel was broken to ½-in. gauge, and mixed with a sufficient proportion of sand to fill the interstices. Briquettes of the Portland cement used for making the concrete were previously tested, and successfully withstood a tensile strain of 400lb. per square inch of section after seven days' immersion in water. Four blocks of each of the following varieties of concrete were then made, viz.:—

A. Concrete composed of six parts cleaned broken bricks, one part sand and one part Portland cement.

B. Concrete composed of six parts uncleaned broken bricks, one part sand and one part Portland cement.

C. Concrete composed of six parts broken stone, one part sand, and one part Portland cement.

D. Concrete composed of three parts of cleaned broken brick, three parts broken stone, one part sand, and one part Portland cement.

E. Concrete composed of four parts cleaned broken brick, two parts broken stone, one part sand, and one part Portland cement.

The bricks used for the aggregate were very old, rather soft, and easily broken, having pieces of the old mortar adhering to their surfaces; in the remaining intances the old materials were roughly cleaned from mortar before breaking to the required gauge.

The concrete blocks were forwarded to Messrs. Kirkaldy and Sons, and their actual resistance to compression ascertained after being allowed to set in air for thirty-one days. Each block was bedded between pieces of yellow pine, ¼-in. thick, before being tested.

Sand and Gravel.

The terms sand and gravel are a trifle indefinite, so for the sake of distinction all mixtures that will pass a sieve with a ¼-in. mesh is sand, and all that will not pass is gravel. Good authorities state that loose gravel of ¾-in. diameter and under contains about 33⅓ per cent. of voids, which is reduced to 21 per cent. by ramming. From this it can be seen that one part of sand will fill the voids in three parts of gravel, that is a mixture of 1 to 3. The percentage of voids increases somewhat with an increase in the size of the gravel, which would correspondingly decrease the above ratio. The gravel should be of different sizes, varying from coarse to fine screened, or washed entirely free from clay, loam, or other foreign matter, and be free from scale, slime, or humus. Gravel sufficiently clean can often be obtained from river beds or gravel pits, but rarely from gravel banks.

Gravel can be readily cleaned by sluicing. Sufficient water should be used to carry away all objectionable matter, including fine sand. As a rule, more cement is required in gravel concrete than in the same volume where broken stone is used; 10 per cent. is about the amount of extra cement that should be used in gravel concrete over and above that required with broken stone.

Ballast for Building Sites.

If the building is on a clay subsoil an excellent substitute for the layer of cement concrete over the site of a domestic building can be made by burning the clay and mixing the burnt ballast with gas tar whilst it is hot. The mixture can be left for some time till the brick footings are laid, and then it is spread over the site and well rammed, and it will be found to be more impervious than the cement concrete.

With the introduction of reinforced concrete building much greater attention has been paid to the methods of testing Portland cement and selecting the materials for the aggregate.

The lecturer here quoted the recommendations contained in a report of the Materials Sub-Committee of the Reinforced Concrete Committee of the Royal Institute of British Architects.

Composition of Bricks.

Bricks are made of burnt or baked argillaceous or clayey earth, and the quality of the bricks depends upon (a) the chemical properties of the earth; (b) the preparation of the earth; and (c) the different degrees of burning or baking. The following is approximately the chemical composition of a good brick earth—silica 3-5ths, alumina 1-5th, live lime, magnesia, manganese, soda, and potash, 1-5th. Clay or silicate of alumina forms the bulk of brick earths. It possesses the property of plasticity when damp, but upon the application of sufficient heat it gives off its water, losing its plasticity, and becoming permanently rigid; by no known process can its plasticity be restored. It contracts and warps during burning. Silica is present either chemically combined with alumina and water, or free in the form of flint and sand. Its presence in clays produces hardness, resistance to heat, durability, and it prevents shrinkage and warping. According to Dr. Rideal, refractory fire-clays are of two classes: (1) The silicate of alumina class, in which the alumina is about half the silica and the silica mostly in combined form; (2) the silicious class in which silica predominates up to about 90 per cent., mostly in the free state, and the alumina is low. Lime, when present in brick earths, acts chemically on burning as a flux, causing the particles of the bricks to unite, producing greater molecular strength, and in small quantities diminishing contraction. An excess of lime causes the bricks in burning to melt and lose their shape.

Magnesia and iron influence the colour of bricks. Clays often contain various salts and those containing a quantity of common salt when it is in excess it acts as a flux, causing the bricks to warp and twist, in addition to which such bricks absorb atmospheric moisture for a considerable time.

Very few brick earths are found in such a condition as to allow of their being used without some special preparation. They are practically classed as plastic or strong clays, loamy clays, and marly clays.

Plastic clays contain silica and alumina, but very little lime, magnesia, soda or other salts, and are known as pure clays. For the manufacture of bricks these clays require the addition of silica and lime.

Loamy or mild clays contain quantities of free silica, and are known as sandy clays, To these lime is frequently added. Marls or calcareous clays contain a large proportion of lime, make good bricks, and are frequently used without the addition of other substances.

The treatment of brick earths may be performed by hand or machine, and is:—1st, the preparation of the brick earth; 2nd, the moulding; 3rd, the drying; 4th, the burning.

The chief methods of brick-making are (1) hand-moulded clamp-burnt bricks, commonly called slacks; (2) the machine-made wire-cut kiln-burnt; (3) machine-made pressed or hand-moulded kiln-burnt bricks. The ordinary process of brick making is so well known I will not describe it, but Messrs. Eastwood and Co. have recently set up a process for making what are known as slop bricks by machinery, which may be of interest.

Slop Bricks.

The brick earth, which is a thin superficial layer of natural clay, is dug and mixed with water until the mixture is of the consistency of cream; it is then run down iron pipes a distance of more than a mile, and is run into set-backs or shallow tanks formed in the ground, where it is mixed with the ashes or fuel with which it is burnt. After remaining there until the moisture is the consistency of dough, it is conveyed to a machine, in which it is forced into a mould the shape of a brick, only larger, to allow for shrinkage. (The clay generally shrinks about 1-10th in all directions.) From this machine the brick is placed in an iron trolley and run into a kiln, which is 180ft. long, and by means of machinery the trolley passes slowly through the kiln, in twenty-four hours coming out at the other end of the kiln dried and cool enough to handle. It is placed on a second iron trolley and enters another kiln, 180ft. long, in which the brick is raised to a red heat, and slowly allowed to cool as it passes in twenty-four hours to the other end of the kiln, when it is again cool enough to handle, and is taken and stacked ready to be carried away. This process does in forty-eight hours what takes by air-drying under hulks and burning in clumps four months, and the percentage of waste in the first case is not more than 3 per cent., and in the clump-burnt brick 25 per cent. to 30 per cent.

Machine-made Fletton Bricks.

The operation consists in clay-getting, drying, grinding, softing, pressing, and burning. The clay, which is obtained from the Oxford clay formation and is a dense bluish-grey

[*Part of a Paper on "Materials," read before the Architectural Association, on January 8th, by Mr. H. D. Searles-Wood, F.R.I.B.A.]

shale, is dug, dried on a drying-floor to expel superfluous moisture, and ground in a mill similar to a mortar mill, the receiver revolving and carrying the clay under the rollers. The bottom of the receiver is perforated, which allows the material when sufficiently ground to fall through as a coarse powder into a pit beneath. It is then elevated and shot into a revolving circular sieve, the material that is sufficiently fine passes through, the remainder is conveyed back to the grinding mill. The sifted powder falls into a hopper, from whence it is passed to the pressing machine, where bv an ingenious arrangement it is measured off and passed under the die, when it is pressed into the form of a brick and removed automatically from the mould. The bricks are then placed on barrows and slaked in the kiln, which is of the Hoffmann type, and then burnt. The time from digging the clay to the slaking in the kiln need not occupy more than fifteen minutes; the time taken to burn the bricks usually occupies about three weeks. Bricks made by this process are being sold in the brickfields, the lecturer said, at 9s. per 1,000. The danger of the process is that the Oxford clays contain many fossils such as ammonites, belemnites, etc., and the men who dig the clay are paid 1s. 6d. per bushel to pick out the fossils.

Varieties of Bricks.

Sand-faced bricks are of a beautiful red colour and texture, often made by hand and pressed by machinery, they are kiln-burnt, and in selecting them great care has to be taken to see that they are sufficiently burnt; the rough test is to sound them, the well-burnt ones have a ring, while the slack-burnt ones sound dull.

Rubbers are similar bricks, only always hand-made, and of a uniform colour and texture throughout; they can be moulded by cutting with a steel-twisted wire saw and filing; also they can be carved. They are made red and white, but the red ones are the most satisfactory.

Pressed bricks as a rule are made from stiff plaster clay, if white from gault; the red colour is due to oxide of iron, the white to lime, usually in the form of chalk. A new form of white brick is now being made by mixing lime and white sand and pressing the mixture in a mould; they are known as Acme bricks.

Glazed bricks are usually made from stoneware clays, and are either saft-glazed, that is, salt is thrown into the kiln to produce the glaze, or are dipped in a slip of specially-prepared clay then half-burnt, which produces a smooth china face.

(*To be concluded.*)

Notes and News.

The School of Art Wood-Carving, we are officially informed, has removed to new premises at 39, Thurloe Place, South Kensington, off Exhibition Road, three minutes from South Kensington Station.

* * *

It has been decided to perpetuate the memory of the late Sir George Livesey, and the Committee having the matter in hand desire to announce that contributions to the Fund should be sent to the Secretary of the Institution of Gas Engineers, 39, Victoria Street, Westminster. A sum of at least £10,000 is required for the object in view, the endowment of a Livesey Professorship in Gas Engineering and Fuel at the Leeds University—and contributions, both small and large, will be welcomed. Having regard to the great services which Sir George Livesey rendered the industrial world, and indeed to all classes of the community, it is felt that there will be a general desire throughout the country to do honour to his memory.

* * *

The finest extant portion of the town walls of Newcastle-upon-Tyne has been transferred from private ownership to the possession of the Corporation. The purchase includes Morden Tower, a vaulted bastion having a modern superstructure, and Arber or Herber tower, occupying a salient angle of the town wall and still retaining its vaulting, loops, parapets, and other original features. The walls between these towers remain, with but few breaks, for a length of 400 yards. The walls and towers of which these form a part are the work of Edward I., under whom the circumvallation was carried out in 1280.

* * *

Mr. F. Bligh Bond, of Bristol, described in a recent lecture to the Somersetshire Archæological Society at Taunton his discoveries during the excavation of the foundations of St. Edgar's Chapel at Glastonbury Abbey, a work to be resumed next spring. He believed it would be found that the total length of the Abbey Church was 59ft., which would make it the longest church ever built in England, and probably in Christendom. Mr. E. F. Somerville, one of the trustees of the Abbey, expressed the hope that people would not believe the story that the rebuilding of the Abbey was contemplated. Such a work would cost half a million.

* * *

The proposed union of the London Institution with the Society of Arts will, if the proposals now under consideration take effect, involve the abandonment of the present buildings in which the two bodies are respectively housed, and the erection of new premses in a more convenient position, Kingsway being suggested, and £100,000 being named as the probable cost.

* * *

Bournemouth Town Council has decided to erect a Kursaal, at an estimated cost of £45,000, on Belle Vue site, near the Pier approach, recently acquired by the corporation. The Mayor stated that the scheme, with the completion of the Undercliff Drive and provision of municipal buildings, could be carried out at a total capital outlay of £165,000. He showed that by increasing the rateable value and by increased revenue they would be able to meet the annual charge of interest and sinking fund of £5,600 without any interest in the rates.

* * *

The Lambeth Borough Council are applying to the London County Council for a final loan of £7,000 for the balance of expenditure upon the Town Hall buildings, fittings, etc. Loans amounting to £39,484 have already been sanctioned, and the sum of £5,535 arising out of a sale of land has been transferred as a contribution towards the cost, making a total of £44,019. The total expenditure upon the buildings, fittings, furniture, etc., is about £52,000.

Our Plate.

We give this week a perspective drawing of the New Rating Offices of the Corporation of the City of London, which are being erected from the designs of the City Surveyor, Mr. Sydney Perks. Unfortunately, plans and particulars are not available. The base of the building appears to be of polished granite; the upper stones of Portland stone, and the roof is covered with green slates.

BURY SECONDARY SCHOOL COMPETITION.

We published the award in this competition in last week's issue, and now illustrate the premiated plans.

At the beginning of last spring the Bury Education Committee advertised for architects to send in applications, if they were willing to compete in the school competition. The majority of the competitors who were invited doubtless thought that only twenty or thereabouts were accepted by the committee. It was known, however, that 200 architects were invited out of 300 applications. Though invited in name, the competition was practically an open one.

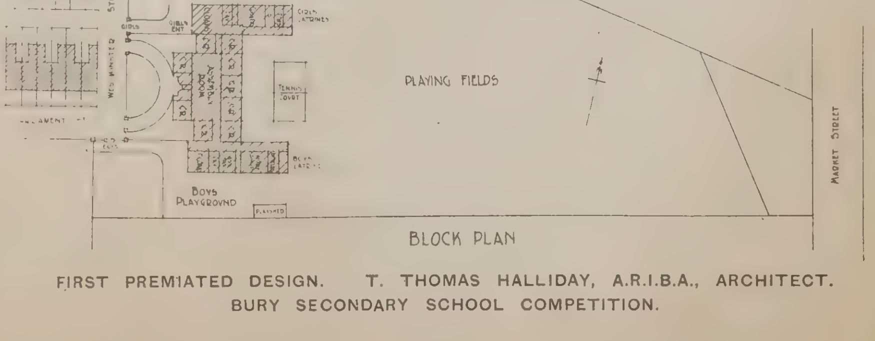
An examination of the three large rooms, packed with plans, gave one the impression that no weeding-out process had been adopted in selecting the architects. We have not seen for years such a poor collection of plans, taking them as a whole. Over 130 of the competitors did not know the most elementary rules of secondary school planning. In commenting on the exhibition the assessor says:—"It is to be regretted that many competitors have not given sufficient attention to the very clear conditions and instructions furnished and to the regulations of the Board of Education, which were also furnished. The somewhat peculiar nature of the site, the difficulty of obtaining fall for the drainage system, and the important questions of aspect and cost have compelled me in several cases to set aside designs which are in many respects meritorious." It was quite evident by the pre-historic type of draughtsmanship adopted that many elderly architects had been carefully spending months over their drawings, or had unearthed some old assistant with the help of the office lads to blacken in the windows. That is the most charitable interpretation we would like to put on this poor collection of plans. Their authors will be well advised to leave this class of professional work severely alone, as the only result is a waste of energy, time, and good Whatman paper, followed by disappointment and complaining letters to the building papers.

The award given by the assessor, Mr. J. W. Simpson, Vice-President and Fellow of the Royal Institute of British Architects, is a fair one, particularly as regards the first and second premiated designs. How the third placed came to receive an award is both a puzzle and a surprise, as there were still a few decent designs left that were better planned with some architectural character, and drawn by competent draughtsmen.

Generally.

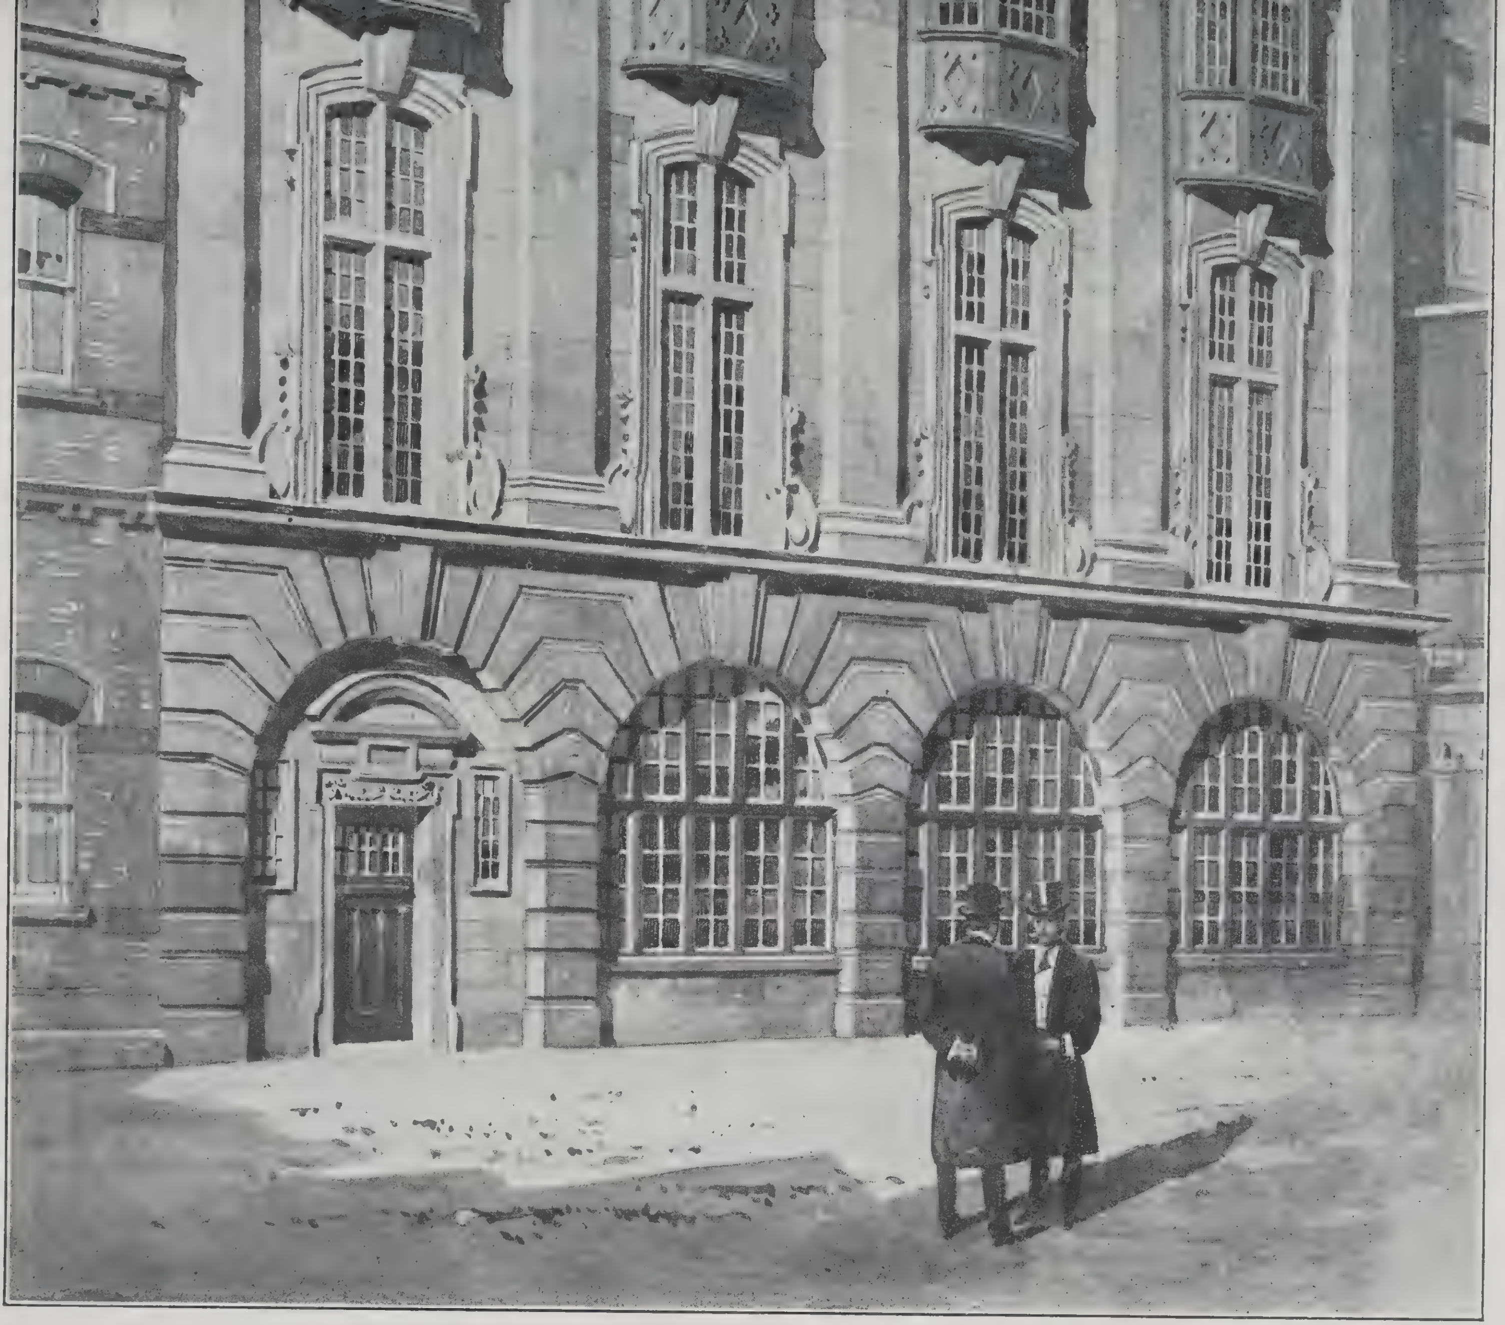
The conditions of the competition were reasonable, although the paying of the architect an inclusive fee is a bad precedent, and is likely to be followed by other public bodies.

School accommodation for 350 boys and girls had to be provided. A well-proportioned assembly hall (to seat the above number of scholars, exclusive of platform), and thirteen classrooms, with laboratories, lecture room, art workshop, and cookery rooms,



FIRST PREMIATED DESIGN. T. THOMAS HALLIDAY, A.R.I.B.A., ARCHITECT.
BURY SECONDARY SCHOOL COMPETITION.

[illegible]



NEW RATING OFFICES AT THE GUILDHALL, LONDON. SYDNEY PERKS, ARCHITECT.

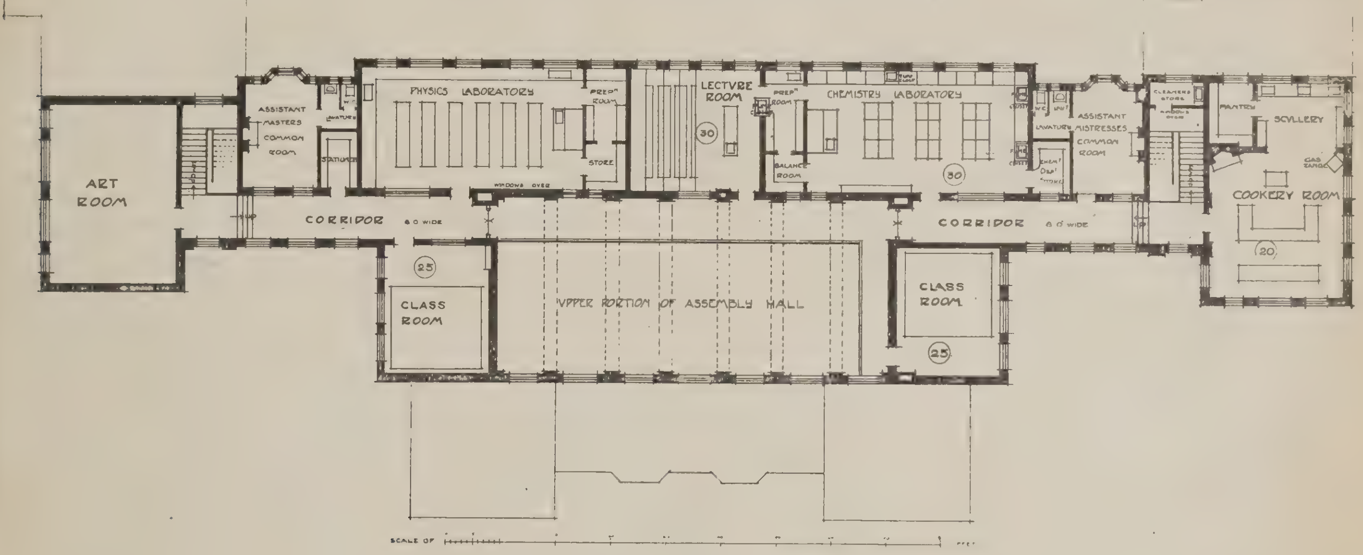
ormed the principal requirements. The cost was stated to be an important element n determining the competition, and £12,500 as the sum mentioned. The committee deemed it advisable to add a paragraph cauning competitors to be careful about the e of architecture, not to be too extravagant or ornamental, but to secure a simple inexpensive building. The remaining difficulties included a peculiar shaped site, also some trouble in planning the drainage system so as to secure the necessary falls, and the important question of aspect.

Design Placed First.

A premium of £50 has been won by the plans of Mr. T. Thos. Halliday, A.R.I.B.A., of Stockport. The scheme is not so compact as some secondary schools recently built, and the tendency throughout this plan—which is also noticeable in many of the designs—is the spreading out of the rooms so as to fill the west end of the site from north to south. This plan has no serious objections, and while not brilliantly clever or strikingly original, yet it fulfils the conditions in a practical manner, and ought to make a good working arrangement, being easily supervised. Both the assembly hall and classrooms are well planned. Eleven out of the thirteen classrooms are on the ground floor. Seven are entered directly from the hall, and the remainder from the corridors. All have left light, with a suitable aspect, though a few of the rooms face due north.

There are a few details throughout the plans which require rectifying, particularly the glazed screens between head-teachers' rooms and the assembly hall. A door is preferable beside the private or public entrance from vestibule. Book and stationery store adjoining have no direct light—the former should have a glazed screen adjoining hall side. The projecting wings on either side of main school do not balance well. More care when setting out the plans would have improved these blocks on both floors. On one of the wings there is a huge wood store which could easily be divided, and a game store made to form part of the extra space, with a door adjoining boys' playground entrance. While the lighting of the main rooms is ideal, many of the small store rooms have been overloaded and are unserviceable as shown.

The first floor plan is rather long drawn out in the arrangement of the rooms. It is doubtful if the cookery room is sufficiently isolated or cut off from the classrooms. The continuation of the assembly hall gallery round one end of the hall spoils the balance, and it is not worth sacrificing the appearance of the plan for what is gained. Evidently left light or disconnection from corridor adjoining cookery room has been the motive for the arrangement shown. The laboratory works out well, though there are too many doors between gallery and laboratories for a speedy assembly and dismissal



FIRST FLOOR PLAN

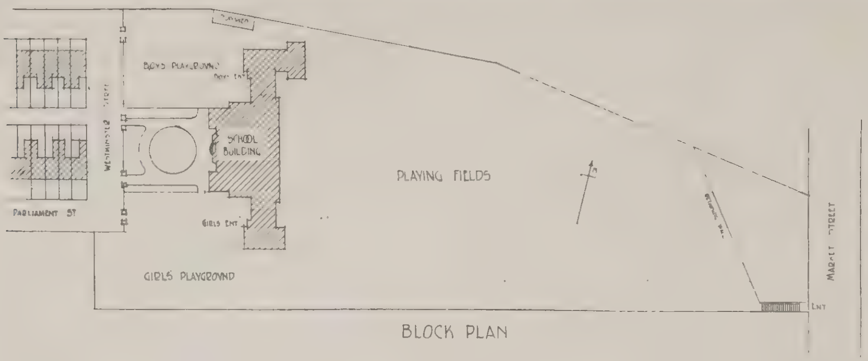
BURY SECONDARY SCHOOL COMPETITION: FIRST PREMIATED DESIGN. T. THOMAS HALLIDAY, A.R.I.B.A., ARCHITECT.



BURY SECONDARY SCHOOL COMPETITION. SECOND PREMIATED DESIGN. CASTLE & WARREN, ARCHITECTS.

of the scholars in using the lecturing room. In designing the elevations the architect has emphasised the entrance front by a high clock-tower, which is placed in such a position that it can be seen down Parliament Street from the main thoroughfare. Quite a considerable feature, if the cost will permit of it, and if properly placed. In this case it is shown over girls' entrance, and gives the elevations a lop-sided appearance, and takes away all balance and harmony in the composition. We don't care for the semi-domestic treatment of the elevations; they are far too fussy, and want half the ornamental played-out detail omitted; they may then look simple and dignified, and like a school instead of a Welsh mission hall. A clearly drawn view in Indian ink has helped to save this set in the eyes of the assessor. Many designs have been pulled together and improved upon by the perspective artist, and this scheme was no exception to the rule.

The boys' playshed is too near the school, as shown on block plan, and the lay-out of the ground could be improved upon; also the position of the building on the land. It is proposed to deal with the large amount of earth at the east of the site by cutting off all the loose portion of the soil at the bottom of the slope and building a retaining wall, four feet high, across the site. The slope above could then be planted with shrubbery The total contents of the building are 437,719 cub. ft.

Design Placed Second.

This position, with £25 premium, has been awarded to the scheme submitted by Messrs. Castle and Warren, of London. We recollect seeing the work of these young architects before in open competition. This set is one of the best they have prepared, and is, from an architectural and draughtsmanship point of view, the best on exhibition. It is the planning that is the chief fault of their scheme, especially in the arrangement of the projecting wings, through length of corridor and interference with south light to most of the classrooms. Assessors are still apt to treat secondary on the lines of elementary schools in the matter of sunlight, although for older scholars the rays of the sun will militate against serious study. Until this orthodox rule is amended the majority of competitors will have to abide by the old principle.

The block plan is well arranged and the building set back further than most of the schemes. It is admirably balanced considering the awkward shape of the site. The entrances for scholars do not work in happily and appear cramped and too near the public approaches. Both the long corridors in the side wings would be too draughty—the doors at the entrances would create more likely a hurricane instead of a gentle blow through. Snow and rain would also be carried well into these corridors. The grouping of the classrooms round the hall is done in a wasteful manner, making too many projections throughout the plan. A parallelogram or slightly squarer plan with shallow breaks—as few as possible, and only then for architectural effect—is the best type of block plan for most schools.

The first floor is more compact than the ground plan, but narrow corridors and errors in the arrangement of some of the rooms detract from its appearance.

In the exterior treatment this design is a long way the best architecturally; all the elevations are interesting, though inexpensive. The set is smartly drawn and original in parts, and a most creditable scheme in every way. A softly coloured view—a trifle small in size—completed this charming set of drawings.

Design Placed Third.

The plans submitted by Messrs. Appleyard and Quiggin, of Liverpool, received the third premium of £10. In all fairness, we don't think that this scheme is entitled to this position, as a few superior sets have evidently been overlooked by the assessor. This is not as satisfactory a design as this firm has turned out in the past. Although famed for their planning, it is in this case most disappointing. The arrangement is stereotyped and indicates the authors who have worked the same plan successfully at Wallasey, Cheshire. In detail this plan, of course, differs, and it is not comparable to that school.

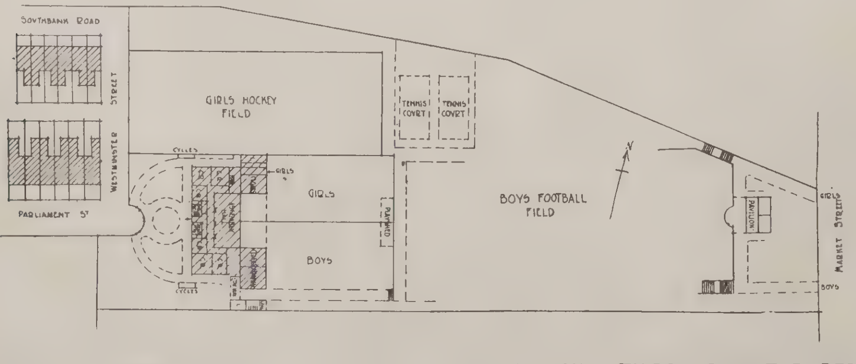
An objectionable feature is the position of the cloakrooms, lavatories, and latrines. They look congested and not too well lighted and ventilated. The boys' cloakroom is quite separate from the lavatory—the latter being situated 40ft. further at the end of the covered way.

On the first floor, the assistant teachers' rooms are too far from the main stairs to be easy for access and supervision. Over the assembly hall above this floor are the chemical and physical laboratories, lecture rooms, etc., centrally placed, but most of the rooms are too deep and square for window lighting without supplementary top-light.

The elevations are commonplace and dull, and void of any pretensions to architectural design. They were poorly drawn, and the perspective that accompanied the set was badly set up and looked as if it had been inked in by an apprentice. The cube contents amounted to 394,310 cub. ft.

Other Designs.

We are surprised to find that many of the leading school architects were not represented in this competition. Some must have applied for the privilege of competing, but well-known favourites that you see in all open competitions were not represented. Their place was filled as a rule by sets that were no credit to the profession. The following schemes were well arranged and worth mentioning:—Nos. 40, 71, 77, 44, 9, 48.



BURY SECONDARY SCHOOL COMPETITION. BLOCK PLAN: THIRD PREMIATED DESIGN. APPLEYARD & QUIGGIN, ARCHITECTS.

Notes on Competitions.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Jan. 31	*SOUTH BANK - IN - NORMANBY. Town Hall, Council Offices, etc., for the Urban District Council. Particulars of the Clerk, Town Hall South Bank, S.O., Yorks.
Mar. 17	NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3,500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council. Stanley S,O., Co. Durham.
Mar. 31	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days.

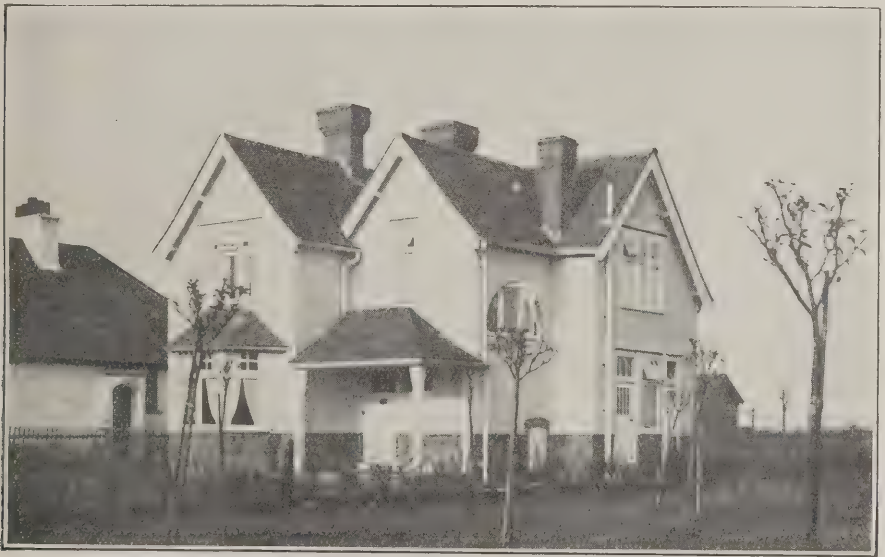
**The R.I.B.A. Council has requested Members to refrain from competing.*

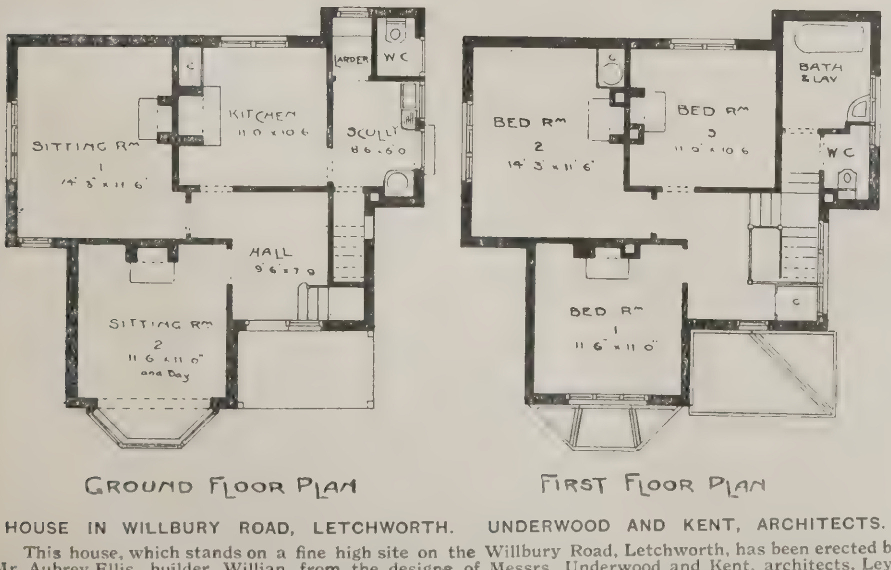
The Technical Institute for Colchester Competition.

"The Contract Journal" of the 6th instant takes strong objection to the awards recently made in this competition. The Colchester District Higher Education Sub-Committee of the Essex County Council invited about twenty architects to submit designs for this building, and offered premiums of 30, 20, and 10 guineas, respectively, for the three best designs. Instruction 12 to the competitors reads as follows:—"It is desired to keep the cost within the sum of about £10,000," and Instruction 6 is worded as follows:—"In case, on the receipt of tenders to carry out the accepted plan, the lowest of such tenders shall be found to exceed by more than five per cent. the amount of the estimate, which shall have accompanied the plans approved by the committee, the committee shall be at liberty to reject such plans." The assessor has selected for the first premium a design estimated to cost £16,500; for the second premium a design estimated to cost £14,204; and for the third premium a design estimated to cost £12,800. Our contemporary observes thereon: — "The first prize was, therefore, awarded for a design which totally disregarded one of the most important terms of the competition, namely, the cost; a design admittedly of no more use to the Colchester committee than a copy of the design for the technical institute for Birmingham or of the Imperial Institute." A letter has been sent to competitors stating that "owing to the excessive cost of the design placed first by the assessor the committee are unable to appoint the authors as architects." Apparently only one design is estimated by its authors to work out at the stipulated cost of "about £10,000," and this "with slight modifications," the committee are thinking of carrying out. We are not quite certain against whom our contemporary's indignation is directed for this state of things, unless it be the assessor. But inasmuch as it is admitted that the accommodation required is "of no limited or modest dimensions, and it is no wonder that only one design, No. 8, complied with the £10,000 limit" (and it is not yet known that this design can be carried out for that sum, or within the margin of 5 per cent. above it, as stipulated in Instruction 6), we do not feel constrained to blame either the assessor or the competitors. The trouble is probably due entirely to the action of the sub-committee; and is the result of the vicious manner in which these competitions are instituted. The difficulty would doubtless not have arisen if the sub-committee had called in their assessor at the beginning and said "We want such and such accommodation, and we have so much money to pay for it. Can we do it?" The assessor, if he was at all fitted for his position, would very quickly decide whether the accommodation must be diminished or the money increased. The competition would then be instituted on reasonable and satisfactory lines, the assessor drawing up the conditions and instructions. But these committees draw up their own conditions, usually with the assistance of the surveyor, every member adding his own fad to the main scheme, the competition is started, and the assessor is then appointed to select the best design. We think it his duty, in such a case as the present, to state very strongly in his report that the demands of the authority are impossible of fulfilment on the sum allowed; and he has therefore selected the three best designs irrespective of cost. It may be noted, too, that the sub-committee has stated definitely that £10,000 is the limit of cost allowed. "It is desired" to keep the cost within . . "about £10,000." This leaves every competitor in a hopeless muddle; since he does not know whether to strip his building of every atom of architectural merit, or how low a standard to adopt to render his success probable. The first duty of every public body, instituting a competition, is to select an assessor and secure his advice at the start, and if they do not do so they have only themelves to blame if the results are unsatisfactory. And if there is an absolute limit as to cost it should be stated in clear and unmistakable terms, and not in the vague indefinite terms in the conditions of this Colchester competition.

Bury Elementary School.

The award in the competition for a new elementary school in the Elton Ward (not to be confused with that for a secondary school, the result of which we published last week), was announced on the 5th instant, as follows: 1st, Mr. Frank S. Biram, St. Helens; second, Mr. G. E. Bolshaw, Southport; third, Messrs. France and Laycock, Manchester. Mr. John W. Simpson, Fellow and Vice-President of the R.I.B.A., was the assessor, and twenty-three designs were submitted.





GROUND FLOOR PLAN FIRST FLOOR PLAN

HOUSE IN WILLBURY ROAD, LETCHWORTH. UNDERWOOD AND KENT, ARCHITECTS.

This house, which stands on a fine high site on the Willbury Road, Letchworth, has been erected by Mr. Aubrey Ellis, builder, Willian, from the designs of Messrs. Underwood and Kent, architects, Leys Avenue, Letchworth. The walls, up to the cill level, and also the chimneys, are built of red facing bricks, with white mortar joints, and the other portions are roughcast. The roofs are covered with red tiles.

Rivelin Valley Village Scheme, Sheffield.

The "Sheffield Daily Telegraph" laments the want of enthusiasm displayed by Sheffield architects in a competition for laying out the Rivelin Valley Estate, belonging to the Waterworks Department of the Sheffield Corporation. The intention is to promote an ideal vilage or garden city, and premiums of £21 and £10 10s. were offered; but less than a dozen designs were received. The professional assessors are Messrs. E. Holmes, Assoc.M.Inst.C.E., E. M. Gibbs, F.R.I.B.A., and Peter Marshall, and with them are associated Ald. Styring, chairman of the Waterworks Committee, and Mr. Terry, general manager of the Waterworks Department.

Doncaster Municipal High School.

The Corporation have received the designs for the above to be erected at a cost of £12,000, exclusive of the site. Mr. E. R. Robson, F.R.I.B.A., of London, is the assessor.

Dumfries and Maxwelltown Fever Hospital.

The Town Councils of Dumfries and Maxwelltown have resolved to invite competitive plans for an infectious diseases hospital in the neighbourhood of the Stoop, on which an eminent architect will be asked to adjudicate. The successful architect will be entrusted with the work at the usual fees, and premiums of £10 and £5 wil be awarded to the designs placed second and third respectively. The buildings are not to exceed a cost of £3,500, and are to provide accommodation for twenty patients, with the necessary administrative offices. The walls are to be built of brick, rough-cast.

Palais de Justice, Toulon.

The competition for the reconstruction of the Palais de Justice and prison at Toulon has been decided as follows:—1st (5,000 francs), Mr. Monestel, Toulon; 2nd (3,000 francs), M. Georges Debrie, Paris; 3rd (1,500 francs), M. Roustan, Toulon; 4th (500 francs), M. Gassier, La Seyne (Var).

Whitley Bay Public Shelter.

In the competition for the above, held recently, the premium of £20 has been awarded to Mr. Edward Cratney, of Wallsend-on-Tyne and Sunderland.

Blackpool Central Library Competition.

We have received the following letter from "Competitors":—

Sir,—It is not often that architects make a protest on the appointment of an assessor before his award has been made known, but under the circumstances we think the profession has just cause for complaint. Seeing the assessor has not started to view the designs a timely warning might be of service to him. At the outset, many complaints were made about the conditions—these have now been amended—though the most important point of all has been overlooked, namely, the selection of an assessor. Mr. Searles-Wood resigned his appointment voluntarily, and in his place we have Mr. Willoughby. Over 141 architects are competing, and had they known previously who was the assessor the majority would have withdrawn. Should this award prove at all satisfactory it will be a pleasant surprise to the profession. It will be a refreshing change to many of us—with library experience—who have competed in many competitions in Lancashire; and have been bitterly disappointed in the results. We think the R.I.B.A. ought to have taken up the case and suggested an assessor from another district, as the present assessor must know both the work and authors of many of the designs submitted, and his recent awards have given great dissatisfaction to competing architects.

Middlesbrough Library Competition.

We have received the conditions for the above, and call the attention of competitors to certain clauses which require amending. The general conditions and instructions are fairly reasonable. We note a somewhat indefinite request that ought to be definite. It states that "a competitor may at his discretion, send in an anonymous "report," explanatory of any detail or details of his design not made clear by the plans, and this will be marked with the same number as the plans." This, it is assumed, is just the ordinary report and estimate, and should be made binding on every architect, otherwise what is the use of a design being submitted without an estimate and description of the building materials? There is only a five per cent. margin allowed if the tenders exceed £12,000. This is a point which corporations are cutting down to a minimum. It is generally too small a margin, and unreasonable in the case of an outside architect erecting a building in a district where he is not conversant with the local building materials, prices and trade customs. The site for the proposed library will prove a difficult one for most competitors to plan, as the suggested dimensions and arrangements—apart from the awkward shape of the site—have been prepared from a preliminary plan which must have been void of all balance or architectural conception, and at the same time portrays not even an elementary knowledge of the requirements of a library. Almost a square space, 54ft. by 38ft. is suggested for the new room. This is on a par with the "Furnace," boiler, and coke-store, which has to be 15ft. by 10ft., hardly the size for the comfortable firing of adjacent boiler, let alone stores adjoining. We note that the staff lavatories are specified on the first floor, and the staff room in the "attic!" We wonder where the information was gathered from. The economical question has been carefully considered, as competitors have to utilise under gables as stores. These are a few of the quaint ideas which struck the genius who framed the conditions and who has the audacity to charge two guineas for such brilliant information. Otherwise the conditions show an endeavour for fair dealing, as a professional assessor will be appointed and his decision will be final.

At the Hampshire Quarter Sessions, Sir William Portal moved a resolution asking the Court to concur in the removal to the Great Hall of Winchester Castle of the statue of Queen Victoria now standing in the Abbey Gardens, Winchester. Sir William pointed out that the statue was the gift to the county in the Jubilee year of 1887 by the then High Sheriff, Mr. W. Ingham Whitaker, and that it was intended by the donor to stand in the Great Hall at the western end, where, from the time of the Conquest, the Sovereigns of England convened Parliaments and administered justice for centuries. The plan was abandoned in consequence of the opposition of the late Mr. Melville Portal, then chairman of the Quarter Sessions, who failed to see any merit in the statue. He failed to grasp the audacious and altogether unconventional genius of Mr. Alfred Gilbert. His opinions, however, were not shared by the late Earl of Northbrook and the late Lord Montagu of Beaulieu, but after having been set up in the Castle yard and then removed and covered up, as a temporary expedient the Winchester Corporation gave it a place in the Abbey Gardens on the express condition that it should be returned if required. Sir Edward Poynter, P.R.A., and Mr. Thomas G. Jackson, R.A., had both advised its removal, and Mr. Gilbert himself, although somewhat disheartened at the treatment the statue had received, was willing to finish it. He had designed a special base for it, and the exquisite details would be completed at the expense of the son of the generous donor, Mr. Ingham Whitaker. Mr. E. Pember, K.C., seconded the motion, and sympathised with the city of Winchester in losing the statue. It was, he declared, the grandest representation of modern national art in England, and he was glad it was now going to be properly housed and taken care of. The feeling of the Royal Academy, not only the sculptors, but the painters, agreed with that of Sir Edward Poynter, and those who represented sculpture in the Academy were quite at one that this was an indoor statue, and that to do it justice it ought to be carefully housed indoors. The Court unanimously agreed to the proposal.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

The querist's name and address must always be given, not necessarily for publication.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Books on Illuminating.

ABERDARE.—E.G.H. writes: "Please recommend a book that affords real assistance with respect to the production of illuminated addresses, etc."

We forwarded this enquiry to Mr. B. T. Batsford, 94, High Holborn, who kindly replies:—"The best book I can recommend your correspondent is the following: Tymms and Wyatt's 'Illuminating,' which contains 100 beautiful examples printed in gold, silver, colours, drawn from choice specimens of the sixth to the sixteenth centuries and comprising richly executed borders, initial letters, and alphabets. Royal 4to, cloth, published at £3 10s. for 30s. net."

District Surveyor's Fees.

The reply given to the enquiry in the issue of December 16th, with reference to a fee being chargeable by a district surveyor for new drainage to old buildings, is incorrect. The supervision of drainage is the province of the borough council's officers, and not of the district surveyor. The only fees payable to a district surveyor are those enumerated in the third schedule, and the by-laws of the London Building Act, and no fee is included for the supervision of drainage. If, however, the drains have necessitated excavation within 3ft. of the building, the district surveyor is entitled to a fee of 5s. for superintending the filling in, according to the requirements of the by-law.

HERBERT KENCHINGTON.

Inserting Dampcourse in Existing Building.

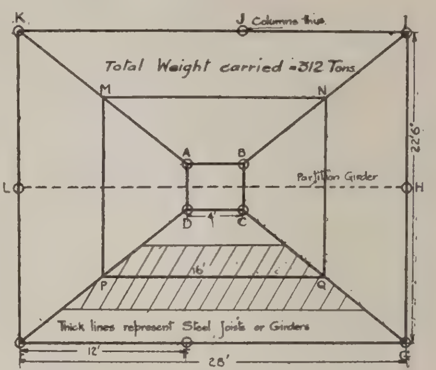
PONTYPRIDD.—G.L.M. writes: "Where the damp-course has been omitted from a building, what is the best means to adopt to counteract the dampness which has arisen? The level of the surrounding ground is at least 6ins. below the level of the floor."

Underpin the walls, and put in the damp-course, which should preferably be bitumen, so that it can be properly joined in short lengths. A double course of solution and cement might also be used, but bitumen would be best. Presuming that the walls have proper concrete foundations, the soil might be cleared away and a vertical asphalt dampcourse could be brought up from the foundation to above ground level. If the soil is cleared away to below the level of the concrete foundation under the floors, there would not then be much probability of the damp getting into the walls. If, however, the walls have not a good foundation of concrete, we do not think there is any way of making a good job of the work short of underpinning, as stated.

Ascertaining Stresses for Barley Bins.

GREAT YARMOUTH.—K.A.C. writes: "The accompanying diagram shows details of the constructional steelwork to barley bins. I desire to ascertain the stresses on the various members."

Figs. 1 and 2 show diagrammatically the plan and elevation of the bins. To determine accurately the loads carried by the various supports is a matter of very great difficulty, and it is practically impossible because theoretically the load would depend on the size and elasticity of each support. The stresses in, and loads carried by, the various joists are also very difficult to determine accurately, but the writer believes that the following method of attack is as satisfactory as any. Divide the plan up into 4 pieces,



K
J Columns thus.

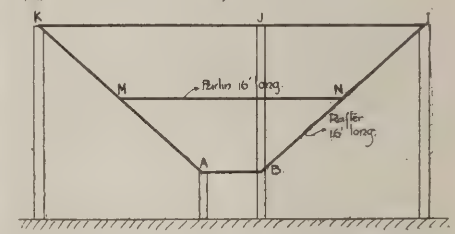
G



one of which is EDCG. The total load is 312 tons, exclusive of building materials, or, say, 320 tons altogether. Then the purlin PQ carries the area shown shaded, i.e, about one half of the load on the portion EDCG, i.e., about ⅛ total load, or 40 tons. For a span of 16 feet this gives a bending moment $\frac{40 \times 16}{8}$ = 80ft. tons. To get this with a single joist an 18in. by 7in. British Standard on a 14in. by 12in. broad flange beam could be used. The purlin P Q distributes 20 tons at P and Q to the rafters E D and C G, and the purlins M P and Q N also each distribute 20 tons at P and Q respectively. ∴ total load at P = 40 tons. This is a central load, and is equivalent to a uniformly distributed one of 80 tons, so that as the horizontal projection of the span is about 15ft, the maximum B M = $\frac{40 \times 15}{4}$ = 150ft. tons. ∴ necessary section modulus of girder = $Z = \frac{150 \times 12}{7}$ (using 7 tons per sq. inch as the same stress), i.e., $Z = 257$ inch units. A built-up section or two beams as indicated above side by side would be necessary for this. This calculation neglects the direct thrust which will come down the rafters, but this is comparatively almost negligible (about ¼ ton per sq. inch). These rafters distribute a load at each of the points A B C. D = $\frac{40}{2}$ = 20 tons, and 20 tons at each of the points E, K, I, G. The joist D C carries about 1-16 of the load on piece E D C G, i.e., 5 tons, so that at each point such as D, $\frac{5}{2} = 2\frac{1}{2}$ tons is distributed from each of the joists such as A D, D C. This makes the total load carried at each of the points A, B, C, D, 25 tons. Now take the girder E G. It is a continuous girder of spans, respectively 12 and 16ft., and the load carried is $\frac{7}{16}$ of the load on the portion E D C G, i.e., 35 tons or 1¼ tons per ft. Then by the theorem of three moments.

$$12 M_E + 2 M_F (16+12) + 16 M_G = \frac{1\frac{1}{4}}{4}(12^3 + 16^3)$$

$$\text{but } M_E = M_G = O.$$

$$\therefore 56 M_F = \tfrac{5}{16} \cdot 4^3(3^3 + 4^3)$$

$$M_F = \frac{5 \times 91}{14} = 32\cdot5 \text{ ft. tons.}$$

The girder must be able to carry this (14in. × 6 in. × 46 lb. would do).

Then load on F = $\frac{35}{2} + \frac{32.5}{14} + \frac{32.5}{16}$ = $17.5 + 2.32 + 2.03 = 21\frac{3}{4}$ tons nearly.

Load at E from this girder = $\frac{15}{2} - 2.32 = 5\frac{1}{4}$ tons nearly.

Load at G from this girder $= \frac{20}{2} - 2.03 = 8$ tons nearly.

Finally consider girder E K. This carries 35 tons and has two continuous equal spans of 11 ft. 3 in.

$$\text{Max. BM} = \frac{35 \times 11.25}{16} = 23.8 \text{ ft. tons.}$$

$$\left(\frac{Wl}{16} \qquad W = \text{Total load} \atop \qquad l = \textit{Each} \text{ span}\right)$$

Load on column L $= \frac{5}{8} W = \frac{175}{8} = 22$ tons nearly.

Load on column K E $= \frac{3}{16} W = 6\frac{1}{2}$ tons nearly.

Summing up our results as to the loads carried we have:—

Stanchions A, B, C, D, 25 tons each	100 tons.
Columns E, I, $= 20 + 5\frac{1}{4} + 6\frac{1}{2} = 31\frac{3}{4}$ each	$63\frac{1}{2}$ „
„ K, G, $= 20 + 8 + 6\frac{1}{2} = 34\frac{1}{2}$ each	69 „
„ L, H, = 22 tons each ..	44 „
„ F, G, $= 21\frac{3}{4}$ each ..	$43\frac{1}{2}$ „
Total ..	320 tons.

L and H carry in addition half the weight of the partition girder. A.

Details of Lead Work on Turret.

SOHAM.—LEADWORK writes: "The turret shown by the accompanying section and elevation is to be wholly covered with lead. I should be glad to know the proper method of working same. No solder is supposed to be used. (1) Where should the joints be made horizontally? (2) Where should the vertical welts appear? (3) How should the angles of mouldings marked A be worked? (4) How should the lead be worked over and around the projections marked B appearing on the faces of the main portion? Should the lead be worked in one piece from G to C, and bossed round these projections? (5) What is the best method of fixing the lead to the woodwork? Please say where the fixings should occur."

No scale is given (an important detail where jointing is in question); but assuming the original drawing to be 1in. scale, the jointing should be as follows:—(1) The covering of base should be dressed up over bottom member of moulding and copper nailed. The mouldings should be bossed up in comparatively narrow strips, copper nailed at top edges as shown, and the free lower edges held in position by light copper clips about 18in. apart to prevent serious movement or disturbance by wind. The weathering of base mould should be dressed up the face of the turret to the height shown by dotted line, bossed over projection B, and fixed with secret copper tacks sweated to back of lead and turned through slots cut in boarding, leaving a slight amount of freedom for movement during expansion and contraction of lead. Sinkings should be formed by the carpenter where double thicknesses of lead occur, to produce a sightly effect. The remainder of each face of turret may be formed in one sheet, lapping at bottom over weathering of face mould, cut to form of bottom edge of centre panel, and from corners of same Y.Y. obliquely to Z.Z. The cornice mould may be treated similarly to base, but an alternative suggestion for the formation of a drip is shown, in which case the lead clips are secret. The final X should be bossed up from one sheet of lead. (2) The vertical welts should be formed on the angles at C., with, say, three secret tacks in each. If the scale has been correctly assumed, no further vertical joints should be necessary. (3) A mitre and short return should be bossed up at the alternative angles of mouldings as shown, and the surface of lead dressed into a sinking, so that this does not project where laying over the undercloak. (4) The lead should be bossed round the projections B. The remainder of this question has been answered incidentally to the preceding ones. (5) The lead should be fixed with secret tacks of stout copper, soldered to back of same and turned through slots cut in the boarding. This will be less unsightly than soldered dots, and allow more movement with less risk of cracking. The positions are dotted on the diagrams. G.

Floor for a Roller Skating Rink.

DARWEN.—EXPERIENCE writes: "I saw a recent inquiry as to what is the best floor for a skating rink. I may say from personal experience that the patent flooring called Firmit would answer this purpose. In several of these buildings I have found that a bit of green colour has been introduced, which in artificial light looks somewhat like ice."

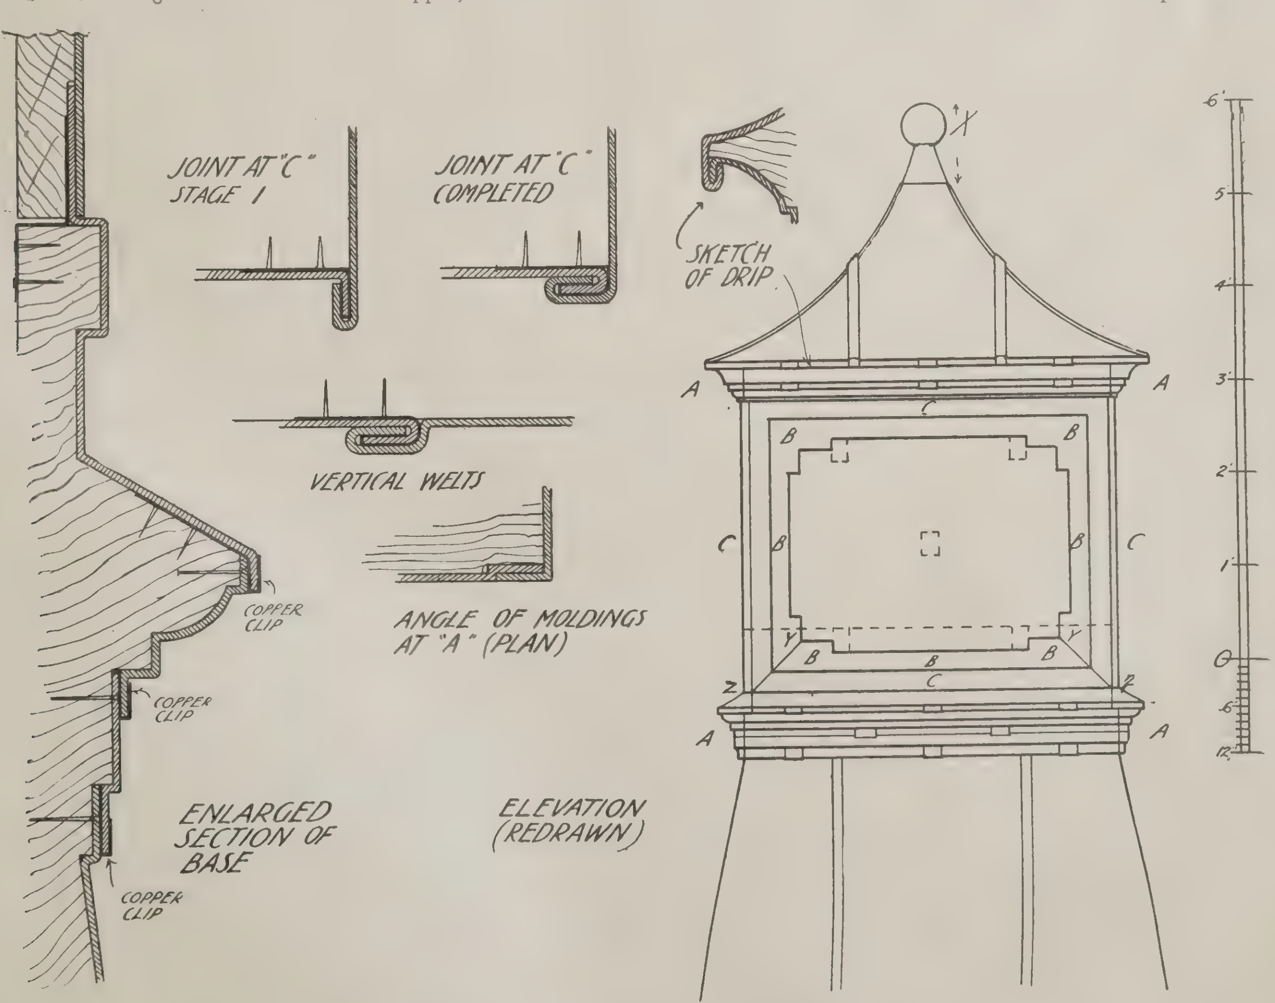
Lantern Slides of Mediæval Architecture.

LONDON.—H. K. writes: "In regard to the inquiry by 'T. Square' of December 30th, there is a loan collection of lantern slides belonging to the Architectural Association, which includes a number illustrating the domestic architecture of the periods mentioned. Full particulars may be obtained from the secretary."

"Notice to Treat" Under the Housing of the Working Classes Acts.

TWICKENHAM.—T. H. S. writes: "After a borough council have served notice to treat under the provisions of the Housing of the Working Classes Acts, how soon after the service of that notice can they be compelled to proceed in the matter?"

The Housing of the Working Classes Act, 1890, incorporates many of the provisions of the Lands Clauses Acts, and the procedure must be in accordance therewith. After a "notice to treat" has been served, the owner must send in a formal claim. If the amount claimed be over £50, the owner may elect whether, in case the claim is not paid, he shall go to a jury or have the amount settled by arbitration. No unnecessary delay must take place in any case; but should he go to a jury, they must be summoned within twenty-one days, and will, of course, give an immediate verdict. The purchase must be



DETAILS OF LEAD WORK ON TURRET.

completed within one year of the first making of the order by the local authority (Section 38, 4). I advise you to get a copy of the Act, the cost is merely a few pence.—F.S.I.

Ascertaining Stresses in Roof Trusses.

London, W.C.—W. A. G. writes: "I was interested in reading the answers to 'Enfield O.S.D.'s' query regarding 'Ascertaining of Stresses in Roof Trusses,' appearing in your issue of November 25th. May I be permitted to suggest that A's reasoning is fallacious to judge by results, as the member C D (please refer to the sketch printed with the article) is obviously in compression?"

Cost per Cubic Foot of Public Buildings.

Bexhill.—W. G. writes: "What is the average cost per cubic foot of such works as the Lambeth Municipal Buildings?"

The cost of the Lambeth Municipal Buildings works out at 11½d. per cubic foot. Probably 1s. per foot would be a fair average estimate of the present cost of buildings of a like nature.

Aspects of Trade Unionism.

Yorks.—Cœur-de-Lion writes: "Can you please give me dates of issues in which have been published articles, papers, or comments dealing with such aspects of trades unionism as (1) Limitation of output; (2) standardisation of wages irrespective of ability; (3) loss of personal incentive; and such others as may bear upon the same theme."

Such topics have been, as a rule, touched upon but lightly in our pages, and have only been noticed when it has been found impossible to ignore them. More or less helpful references to some of the matters mentioned by the querist occur as follows:—Trade Union Congresses: p. 94, Sept. 16th, 1896; p. 104, Sept. 12th, 1900; and p. 100, Sept 16th, 1903. Bricklaying and Trade Unionism: p. 260, Nov. 27th, 1901; p. 274, Dec. 4th, 1901; p. 294, Dec. 11th, 1901; p. 332, Dec. 25th, 1901.

TEXT BOOKS APPROVED BY THE BOARD OF ARCHITECTURAL EDUCATION.

The Council of the R.I.B.A., on the recommendation of the Board of Architectural Education, have issued as a supplementary paper the list of books drawn up by a Joint Committee of members of the Board of Architectural Education and of the Board of Examiners, and recommended to students preparing for the Institute examinations. The list, which will be revised and amended as occasion requires and printed in the Institute Kalendar, is as follows:—

General.

Atkinson, T. D.: English Architecture. 8o. 1904.
Belcher, J.: Essentials in Architecture. 8o. 1907.
Brown, G. Baldwin: The Fine Arts. 8o. 1902.
Brown, G. Baldwin: Arts in Early England. 2 vols. 1903.
Choisy, A.: Histoire de l'architecture. 2 vols. 8o. 1899.
Choisy, A.: L'art de bâtir chez les Egyptiens. 8o. 1904.
Cummings, C. A.: History of Architecture in Italy, from the Time of Constantine to the Dawn of the Renaissance. 2 vols. 8o. 1901.
Fergusson, J.: History of Architecture of all Countries. 5 vols. 8o. 1876-1893.
Gwilt, J.: Encyclopædia of Architecture. 8o. 1888.
Simpson, F. M.: A History of Architectural Development. 8o. 1905.

Classic.

Anderson, W. J., and Spiers, R. Phenè: Architecture of Greece and Rome. 8o. 1908.
Cockerell, C. R.: Temples of Jupiter Panhellenius at Ægina; and of Apollo Epicurius at Bassæ. fo. 1860.
Chambers, Sir W.: Civil Architecture. fo. 1759; or 2 vols. 8o. 1825.
d'Espouy, H.: Fragments d'Architecture antique. fo. 1896.
Gardner, P.: Grammar of Greek Art. 8o. 1905.
Gibbs, J.: Rules for Drawing the Several Parts of Architecture. fo. 1732.
Middleton, J. H.: Remains of Ancient Rome. 2 vols. 8o. 1892.
Normand, C. J. P.: The Orders of Architecture. fo. 1829.
Penrose, F. C.: Principles of Athenian Architecture. fo. 1851; or 1888.
Spiers, R. P.: The Orders of Architecture. 4o. 1902.
Stuart, J., and Revett, N.: Antiquities of Athens. 4 vols. fo. 1762-1816.
Taylor, J. L., and Cresy, E.: Antiquities of Rome. 2 vols. fo. 1821-22.
Gwilt's Translation of Vitruvius. 8o. 1826.
Watt, J. C.: Examples of Greek and Pompeian Decorative Work. fo. 1897.

Byzantine.

Choisy, A.: L'art de bâtir chez les Byzantins. fo. 1883.
Lethaby, W. R., and Swainson, H.: Church of Sancta Sophia, Constantinople. 8o. 1894.
Ongania, F.: Basilica di San Marco. 13 vols. fo. and 4o. 1881-88.
Salzenburg, W.: Alt Christliche Baudenkmale von Constantinopel. fo. 1854.
Schultz, R. W., and Barnsley, S. H.: Church of St. Luke of Stiris, etc. fo. 1901.

Mediaeval.

Atkinson, T. D.: A Glossary of English Architecture. 8o. 1906.
Bilson, J.: The Beginnings of Gothic Architecture. 4o. S.P. 1899.
Bond, F.: Gothic Architecture in England. 8o. 1906.
Bowman, H., and Crowther, J. S.: Churches of the Middle Ages. fo. 1857.
Brandon, R. and J. A.: Analysis of Gothic Architecture. 2 vols. 4o. 1849.
Britton, J.: Cathedral Antiquities. 14 vols. 4o. 1814-35.
Collings, J. K.: Details of Gothic Architecture. 2 vols. 4o. 1852-56.
Collings, J. K.: Gothic Ornaments. 2 vols. 4o. 1848-50.
Corroyer, C.: L'Architecture gothique. 8o. 1891.
Dollman, F. T., and Jobbins, F. R.: Analyses of Ancient Domestic Architecture in Great Britain. 2 vols. 4o. 1861-3.
Dehio, G., and Von Bezold, G.: Kirchliche Baukunst des Abendlandes. 8 vols. fo. and text 8o. 1884-01.
Enlart, C.: Manuel d'archéologie française. 2 vols. 8o. 1902-04.
Lethaby, W. R.: Mediæval Art. 8o. 1904.
Parker, J. H.: Glossary of Terms used in Architecture. 3 vols. 8o. 1850.
Prior, E. S.: Gothic Art in England. 8o. 1900.
Pugin, A.: Examples of Gothic Architecture. 3 vols. 4o. 1831-38.

Correspondence.

The Mersey Dock and Harbour Board Offices.

To the Editor of The Builders' Journal.

Sir,—With reference to your published list of contractors for the work at the New Dock Offices, Liverpool, in your issue of December 30th, we should like to draw your attention to the fact that the interior, as well as the exterior, electric light fittings were executed by us in our studios and workshops in Manchester.

George Wragge, Ltd.

The Proposed Guild of Architects' Assistants.

To the Editor of The Builders' Journal.

Sir,—On perusing the letter by "Architect," in the Builders' Journal of December 9th, on the question of "A Guild of Architects' Assistants," I was struck by the remarks of the writer with regard to the (in the writer's opinion) essentiality of assistants possessing private means. Of the many assistants in the town of Leicester who are personally known to me, not 5 per cent. have private means, and I am sure that such a fact makes them none the less keen in their work, although they may never be principals.

Most of the arguments in "Architect's" letter only go to further emphasise the burning necessity for the formation of some such Guild as outlined by "Assistant." The disgraceful fact, that it is practically impossible for a middle-aged assistant once out of employment to obtain work, surely is not consistent with the "dignity of the profession," of which we hear so much. I am strongly in favour of forming a Guild, and have obtained the opinions of many assistants of my acquaintance in Leicester, and I can safely guarantee that at least twenty are prepared to support the movement. The letter by "Assistant" exactly puts into words what has been my opinion, and the opinion of many others for some time, and I trust that they will not let the opportunity slip, of supporting a movement that would be to the ultimate good of the profession at large, and would also tend to the advancement of architecture.

Leicester.

CONTRACTORS' SECTION.

(MONTHLY.)

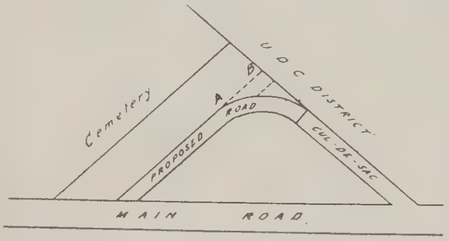
"APPLICATIONS" UNDER THE LONDON BUILDING ACTS.

By **B. Wyand.**

(*Concluded from page* 4, No. 726.)

No objection can be taken to these requirements—except, perhaps, in certain cases, to the one relating to direct communication—so long as the Council exercise their power in a fair and equitable manner. Unfortunately, however, officialism is somewhat too pronounced, and the applicant is entirely at the mercy of a coterie of gentlemen whose mission would appear to be, in the first place, to refuse applications; secondly, to grant them if no other alternative is possible. Should no legitimate flaw be found in the plans, some point for which no provision has been made may be raised, and this will be discussed in all its bearings and application after application refused. Failing any other resource, the applicant may be asked point blank: "How much of your land are you going to give us?" any demur being met with by an expression of grave doubt as to the probable chance of success of the application. When there is a legitimate objection, on the other hand, it becomes a matter of arrangement, the Council being ready not infrequently to sanction a direct violation of their regulations if the applicant is prepared to pay for the concession. I will relate one of my experiences in connection with the laying out of an estate within the county of London, as an illustration of what I have said.

The estate was situated on the border of the county, the adjoining land being within the district of an urban council, in the county of Middlesex, and as yet undeveloped. Running right into the estate was a 40ft. road, with a dead end, forming that abomination, a cul-de-sac. One side of this road was fully built upon, with houses of a good class. The only mode of dealing with the estate (which was of triangular form) was by running a new street in from the main road, through the centre of the estate, and out again into the main road. There was no possibility of a through road communicating with other roads, the three sides of the estate being formed by a cemetery, the undeveloped land aforesaid, and the main road. In order to mitigate the evil arising from the proposed crescent road, I arranged for the cul-de-sac to form part of it, thus doing away with one very objectionable feature and substituting for it one of a much less objectionable nature. The plans were rejected (under Section 9, Sub-Section 4, of the Act), the rejection being accompanied by a verbal intimation that my client must give up a strip of land 7ft. deep for the purpose of widening the main road. In submitting the plans for a second time, I drew the attention of the Council to the fact that some three years previously a certain agreement had been come to between the borough council and my client, whereby, in consideration of my client relinquishing certain land, the borough council undertook to be satisfied with a 53ft. road in lieu of a 54ft. at that portion of the main road upon which my client's estate abutted. "The road is now 53ft. wide," I said, "and I trust that you will reconsider the matter. My client has performed his part of the agreement, and should not be called upon further to concede his rights." I pointed out, too, that the throwing of a 7ft. strip into the main road would mean the destruction, for the whole length of the frontage, of a very fine row of timber trees. The Council was obdurate, however, and again threw out the plans. A third set was submitted, and this time, by giving up a 4ft. strip and carrying a short length of road (as shown on sketch, at AB), running to the boundary, which would of necessity form a cul-de-sac for many years, if not for ever, the plans received approval. In all, the County Council received ten complete sets of tracings (excluding the duplicate supplied for the use of the borough council), for it is the rule of the former body that no plan submitted is ever returned. Were complete plans of a building to cost £20,000,000 to be submitted, and one of the railing heads of the boundary fence to project half-an-inch upon the public footway, a complete new set of drawings in duplicate would be called for. I need not enlarge upon this phase of the subject, however. In the case I have outlined above, the trouble all arose over the strip of land which the Council thought they would like to acquire. They had not the least right to it; indeed, they had less than no right, for an agreement had been entered into to the opposite effect; but they meant to have it if possible. Hence all the trouble, with the creation by them of a cul-de-sac to take the place of the one opened up.



Reinforced concrete construction is recognised in the Bill that is being brought before Parliament next session by the Manchester Corporation, one of the clauses providing that "Notwithstanding any provisions contained in any public or local Act or bylaw in force within the city regulating the construction of buildings, the Corporation shall have power to relax or modify such provisions in the following cases:—Where a person is desirous of erecting an iron, steel, or reinforced concrete building or structure, or any other building to which the general provisions of the said Acts or by-laws are inapplicable, or, in the opinion of the corporation, inappropriate, he shall make an application to the corporation, accompanied by complete plans, sections, and elevations of the proposed buildings, with such details and other particulars as to the construction thereof as may be required by the corporation. The corporation may, for the purpose of regulating the procedure in relation to such application, issue such general rules as they think fit as to the plans, sections, elevations, details and particulars to be presented."

WAYLEAVES FOR TELEPHONES AND TELEGRAPH POLES & LINES.

By **G. S. Mitchell, F.S.I.**

The useful though very unsightly lines and poles connected with the telegraphic and telephonic services, which are controlled as well by the Government as by private commercial enterprise, are rapidly growing more numerous, and however well disposed one may feel towards the progress of the modern methods of rapid intercommunication, it behoves the owner of landed property to safeguard his rights somewhat more jealously than has hitherto been needful; poles are often erected without the landowner's formal consent, and therefore without any written agreement as to their maintenance or removal.

Few persons appear to have any precise knowledge of the rights and powers respectively of the Post Office and of the Telephone Companies, and a great deal of friction and annoyance is experienced which might well be avoided if the real position of things were more generally understood.

I therefore propose to treat briefly with this somewhat obscure subject, and trust that the information which I have myself acquired when dealing with wayleaves of this description may prove of interest, and perhaps of service to the reader.

In the first instance it is necessary to recollect the fact that the presence of poles, attachments, and wires upon the property of another constitutes an easement in exactly the same way as a right of light or of way or to take water, etc., becomes an easement.

This being the legal position, it should not be forgotten that by the Prescription Act of 1838, the uninterrupted enjoyment of an easement "by common law prescription or grant" for a period of twenty years, prevents any action being taken to defeat it, and an owner of property upon which telephonic or telegraphic apparatus has been erected should therefore take care that a proper agreement is entered into by the owners of that apparatus containing among other provisions, a clause by which the landowner is enabled to terminate the arrangement and to call for the removal of the installation at reasonable notice.

The Telephonic Companies wayleave agreements are sometimes drawn to cover the whole period from the date of their execution until 1911, the year in which their licences from the Postmaster-General will expire, and when their lines will be absorbed in the National System then to be inaugurated; but these agreements are not generally to be adopted, because such an arrangement leaves the landowner no power to call for the alteration or removal of poles, etc., even though they may stand in the way of an alteration of his premises or may have become in some other manner objectionable to him.

The best agreement is one which provides for a reasonable notice—say, six months — on either side for the discontinuance of the easement it creates.

A very usual wayleave rental is one shilling per attachment or pole per annum, and this sum covers all the stays and wires which may be necessary to safely secure it, should those stays be upon the same owner's land—but so small a payment as a shilling is only a fair sum when the number of poles is numerous, and it is, of course, quite insufficient when only a single attachment is to be made or when a single pole is to be placed upon one's property. In such a case, if the owner allows the encroachment to be made at all, he should at least stipulate for a rental which will pay for its own collection and naturally in important positions this may be fixed at a substantial sum. I am no believer in the ordinary trifling "acknowledgment rental" of sixpence or a shilling per year, because so small a sum is apt to be lost sight of, or to be paid by a collector out of his own pocket in order that he may avoid the trouble of obtaining it from the person who should rightly pay it.

It need hardly be added that the presence of wires crossing a property forms an encroachment equally with the fixing of a post or standard, and should be paid for accordingly.

After all, the Telephone Companies are commercial undertakings, and though to some extent "pro bono publico," yet they are institutions founded for profit, and should pay what is fair for the privileges they acquire.

The question naturally arises "for what should payment be made?"

In the first place it is not usual to charge for the actual attachment to the house which is being served with the telephone, because that attachment is a necessary portion of the installation for the use of the occupier.

With this exception the Telephone Company should pay, at a price commensurate with its importance and the number of wires it carries, for every attachment to every building, and for each pole which they erect, whether that pole be upon enclosed land, or upon the roadside, notwithstanding that in latter case the Company may also have to obtain the permission of the highway authority for the district.

By the common law of England, every owner whose property abuts upon a public highway is also *ipso facto* the owner of the land to the centre of the road; and this legal presumption is not to be rebutted by the fact that a fence exists between his enclosed land and his half portion of the highway—nor can it be rebutted by the fact that the half of the highway is not defined upon his conveyance, nor there shown as being included in his property.

Similarly, the Post Office authorities are liable to pay for every attachment, wire, or pole, upon private property, whether used for telegraphic or telephonic purposes, but the Telegraph Act of 1863 (26 and 27, Vict., c.112) makes an important exception in favour of the Postmaster-General.

> Section 6 of that Act authorises the Post Office (as successors of the various Telegraph Companies previously constituted by Acts of Parliament)—
>
> (1) "To place and maintain a telegraph under any street or public road, and to alter or remove the same."
>
> (2) "To place and maintain a telegraph over, along, or across any street or public road, and place and maintain posts in or upon any street or public road, and to alter or remove the same."

Section 9 of the same Act provides that the consent of the bodies having the control of the streets, must first be obtained in all towns having more than 30,000 inhabitants, and Section 12 provides for the consent of the highway authority in country districts.

Section 12 also prohibits the placing of "any work above ground" through or by the side of any park or pleasure grounds, or on the private drive to a mansion, etc.

Section 22 prohibits the placing of any telegraph post within 10 yards of a dwelling house without the consent of the occupier, and there are various safeguarding clauses in the Act.

It should be remembered that these statutory powers belong solely to the Post Office, and do not apply to the works of any private person or to those of a limited company. The Telephone Companies have no statutory powers to compel owners or occupiers to allow them to enter upon their premises at all, and they must therefore make a bargain with the landowner and take a wayleave, if he is willing to grant it, with regard to every separate property they cross.

In view of the imminent absorption of the telephones into the Post Office system, it is incumbent upon every owner of real estate to take care that every telephone pole upon his land is paid for, and that the companies do not place any future works upon his property without entering into a proper wayleave agreement, and paying a fair rental for the privilege. These wayleave rentals should be payable in advance annually.

The Royal Sanitary Institute has just elected twelve new members and thirty-one new associates.

"The Gloucester Diary" for 1909, published for the Gloucester Railway Carriage and Wagon Company, Ltd., by F. J. Brooke, Gloucester, and now in its fourteenth year of issue, contains more than a hundred illustrations of the very various types of rolling stock for which the company is famous the world over. Contractors' plant, tip wagons, trollies, etc., of every description, are manufactured by the company.

* * *

A General Council for the National Registration of Plumbers, to whom the Plumbers' Company have now handed over the management of the movement, has been formed. This Council will consist of representatives of local councils existing and to be formed in numerous centres throughout the country, of delegates from the recognised associations of master and operative plumbers, together with nominees of the Plumbers' Company, of the Royal Institute of British Architects, the Incorporated Society of Medical Officers of Health, the Association of Water Engineers, the Incorporated Association of Municipal and County Engineers, and the Association of Technical Institutions. The council will meet annually in various centres. The immediate object of the General Council is to demonstrate to the public, as well as to the various parties more intimately associated with the execution of sanitary work, that the movement has for its basis the promotion of public health, and not the protection of a trade as such. The address of the General Council for the National Registration of Plumbers is 54, Parliament Street, Westminster, S.W.

THE BRICK AND TILE TRADES.

There are not wanting signs of a much larger demand for all kinds of bricks in the New Year. A number of schemes are already passed for the erection of Technical Schools; the Science and Art Schools are now recognised as a necessity for the advancement of our commerce, and many such institutions are about to be erected. Thanks to Mr. Carnegie Free Libraries are in the ascendant, and both the builders and brickmakers owe him a debt of gratitude. Public elementary and secondary schools, too, will have to be built, and a large sum of money will be expended in this way in the near future. Increasing activity among the various religious bodies has led to a number of schemes for new churches and chapels, and this should be a source of satisfaction to the building and brick industries.

All these buildings will give impetus to the making of paving quarries; floor tiles, both plain and ornamental, and roofing tiles of all patterns and colours should find an improving market.

The Local Government Board, with a view to decreasing the number of unemployed, has decided to facilitate the granting of loans to public bodies for various works; and the local authorities are responding to this stimulus from Parliament Street. Factory building schemes are likely to be advanced in consequence of the new patent laws. There is some talk of another Building Trades Exhibition in Birmingham this year; the general opinion is that it would be injudicious, and is hardly necessary. The expense to exhibitors is heavy, and the great Building Exhibition at Olympia in April must not be forgotten. These exhibitions are highly beneficial, as they disclose to builders and contractors a wider circle of manufacturers from which they can draw their supplies. The Tipton firms are making a new purple brick for churches, chapels, libraries, etc., and for such purposes they are viewed with favour by Birmingham and Midland architects. Railway engineers require in their works strength and lasting qualities, and they have been benefactors to the brick trade. A movement is on foot to form a National Federation of Clayworkers. Such a body would aim at uniformity in process and quality, and better management of brick works. Many improved kilns and other modern methods are being dealt with already, and many of the oldest brick makers are putting their works in order, showing that they have hopes of better trade. There are a large number of District Associations, and one of those, the South Staffordshire Blue Brick Association, has recently issued the following general ruling prices at the works (per 1,000 in all cases), viz.:—

Blue Brindles, 23s. to 25s.
Common Blue Wire Cuts, 25s. to 27s. 6d.
Common Blue on Edge, 30s. to 32s. 6d.
Blue Wire Cut Pavings, size 10 by 5 by 2, 30s. to 35s.
Best Pressed Blue Pavings, 10 by 5 by 2, 40s. to 45s.
Best Blue Stocks, 9 by 4½ by 3, 42s. 6d. to 47s. 6d.
Best Blue Stable Bricks (all patterns), 42s. 6d. to 47s. 6d.
Best Blue Bullnose and Splays, 47s. 6d. to 52s. 6d.

All subject to monthly accounts, and strictly nett. Discounts in the trade are now obsolete, prices not permitting them. Of course, as regards these circulated figures, some little freedom is allowed where makers are less successful in their productions, and as regards red bricks, they are sold for as much as they will command, and a fixed list is not possible at present. In large contracts the contractors' buyers purchase pretty much at their own figures.

An illustrated and descriptive calendar, showing the progress of Winnipeg, Canada, from 1870 to 1908, has been received from Mr. Charles F. Roland, Commissioner for that city.

HOW TO FELL A TALL CHIMNEY.

By Herbert C. T. Kemp.

The usual plan of felling tall chimneys is to underpin a portion of the base of the chimney with a number of stout props of timber, about 5ft. long, and then, with a ton of coal, a quantity of solid pitch, two barrels of paraffin, and some shavings, a bonfire was made, and was lit and fed in such a manner that the props would be consumed simultaneously, and with their removal the chimney stack would fall by its own weight in a comparatively circumscribed area. Altogether this was a matter requiring no little skill and experience on the part of the operator in the management of the fire, in order that the whole of the props might collapse at the same moment and allow the chimney to settle on the spot where the base has rested. This is the end to be attained; but it is now claimed that better results can be obtained without lighting a huge bonfire.

The newer method received ample justification when the Bleachfield chimney stack, on the outskirts of Aberdeen, was felled. Built in the year 1846, and rising to a height of 242ft., it was a well-known landmark. It was erected, we are informed, by a bricklayer named Walker, and about 300,000 bricks were employed, representing a total weight of 1,200 tons. Some two or three years ago it was struck by lightning and repaired, but its demolition became necessary owing to rapid decay having set in consequently on the closing of the works and the stoppage of the fires.

CUTTING AWAY THE BRICKWORK FOR THE STRUTS.

The contract for the felling of the chimney was given to Mr. P. Tawse, of Aberdeen, who has carried out several similar operations, and the work of demolition was carefully supervised by Mr. N. D. Ironside, of Messrs. Walker and Duncan, civil engineers, acting on behalf of the Aberdeen Land Association, on whose property the Bleachfield Works stood. By the courtesy of Mr. Tawse we are enabled to show the accompanying illustrations.

From the ground plan it will be seen that exactly half of the base of the chimney was cut away. The brickwork rested on a strong stone foundation, and therefore there was no fear that the weight of the chimney would cause the props to sink and cause the chimney to fall by its own weight before its time. The fuses were arranged so that the centre one exploded first, and the others in pairs, and last of all the wingholes.

The demolition took place on July 17th, 1908, in the presence of, it is said, 30,000 spectators, who were kept at a safe distance by the police.

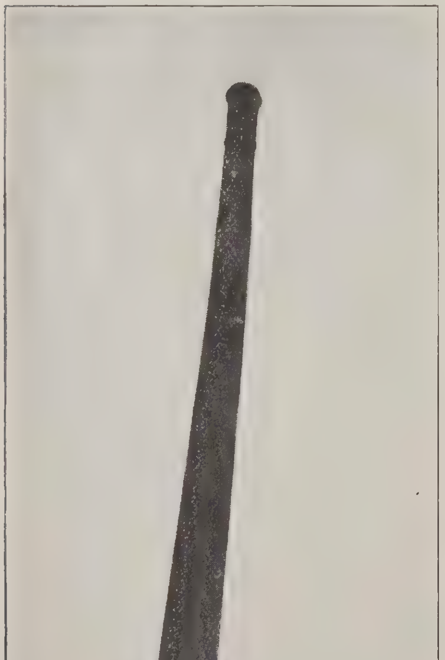
THE CHIMNEY BASE READY FOR FELLING.

The workmen armed themselves with torches, and one of these was handed to Mr. Adam Maitland, chairman of the Aberdeen Land Association, who lit the first fuse and hurried from the scene. The torches were then applied to the other fuses, from which heavy smoke rose and issued from the mouth of the chimney. Two and three-quarter minutes after the fuse had been fired the first shot rang out, followed almost immediately by the other three. The props flew from beneath the brickwork, some shattered—others not. The summit was seen to sway slightly, the result of the back kick of the explosions. Gradually, however it leaned towards the west, and, slowly gaining momentum, appeared as if it was to fall full length on the ground. The strain, however, was evidently too much for the storm-battered structure, and it was seen to fracture almost in the centre. At the same time an explosion burst the base, and the top portion telescoped. The other portions cracked and split, and, amid the explosion of the remaining charges the shaft crumbled away. Huge clouds of dust rose from the debris, and for a time obscured the wrecked chimney from view, but it rapidly cleared away, and it was seen that the immense quantity of masonry had fallen within a very limited area. The operations had been in every way successful. From the time the top was seen to move until the whole erection was on the ground 9 4-5 seconds elapsed. The workmen cautiously approached the great mass of brick and mortar fearing the presence of some unfired explosive. All the charges had done their work, however.



THE CHIMNEY AT THE MOMENT OF THE EXPLOSION.

THE CHIMNEY IN THE ACT OF FALLING.

The accompanying illustrations, which have been reproduced from photographs by Mr. H. J. Kennie, of Aberdeen, show various interesting stages in the operation.

IRON ROOFS.

By T. McGill.

Concluded from page 465, No. 722.)

In Special Cases

where extra wide spacing of bracing is necessary owing to obstructions under the roof, the sheets must be supported between the bracings by angle-steel purlins, and the sections of the bracings as given in the previous table slightly increased. For a spacing between bracings up to about 12ft., centre to centre, $1\frac{3}{4}$ins. by $1\frac{3}{4}$ ins. by $\frac{1}{4}$in. L purlins should be used; and for all spacings above 12ft. and up to about 15ft., centre to centre, which is the maximum that should be used, 2ins. by 2ins. by $\frac{1}{4}$in. L purlins are sufficient. These purlins are connected to the sheets at the points where the bracing bars are fixed, either by galvanised hook-bolts, square nuts, and corrugated washers, as shown in Fig. 10, or by means of light flat iron clips, passing round the purlin and bolted to the sheets by small galvanised snap-headed bolts, square nuts, and small round washers, as in Fig. 11, and spaced about intervals of about 15ins. centres for the full length of the roof. The number of purlins for the various spans is as follows:—One line of purlins up to and including 20ft. span; two lines of purlins up to and including 24ft. span; three lines of purlins up to and including 30ft. span. The method of fixing bracing bars to the purlins, which also forms a splice for the purlin itself, is shown in Figs. 12 and 13. The sections of the bracings as given in the previous table will be sufficient for all spacings up to 12ft., but, above this, the sections should be as given in Table No. 2.

Particulars of the Galvanised Sheeting.

The most important factor in roofs of this type is undoubtedly the galvanised corrugated iron sheeting, as it is so liable to corrosion, due to the acids and moisture in the atmosphere, but if sheets of good quality are obtained, they should last from about ten to fifteen years without requiring renewing. It should be noted that all sheets should be gauged before galvanising, as some makers gauge the sheets after galvanising, thus supplying a lighter gauge than specified. To check this, sheets should always be compared by their weights as well as by their gauge.

The coating of zinc should increase the weight of the sheet by from about $2\frac{1}{4}$oz. to 3oz. per sq. ft.; and if gauged after galvanising, they should measure one or two gauges larger than the original gauge, so that No. 22 sheets would gauge about No. 20 over the galvanising, and sheets No. 24 would gauge about No. 22, and so on.

Details of Sheeting.

The gauge of the sheets to be used in the various spans is given in Table No. 1. These are usually sheets of 10/3ll corrugations, each covering 2ft. 6ins. in width when laid with one corrupation side lap, and 2ft. 3ins. in width when laid with double corrugation side lap, as shown in Figs. 14 and 15, respectively; the latter only being used where the roof is in an exposed position, subject to high winds, or where a special water-tight roof is necessary; although it is perhaps advisable to give the sheets a double side lap in all spans above, say, 25ft. The end lap of the sheets should never be less than 6ins.; and in the larger spans, or

SELF SUPPORTING CURVED IRON ROOFS. DETAILS.

where a very flat curve is given to the roof, this should be increased to 9ins. In roofs of this type, the sheets are always arranged to break joint, or break-band as it is usually termed, thus giving the roof greater rigidity and strength. This arrangement is made by commencing with large size sheets (9ft. long being the usual maximum), and reducing to the smaller sizes in each tier, starting from alternate sides of the roof, as shown in Fig. 16. The sheets are bolted together with ¼in. diameter galvanised snap headed bolts, square nuts, and small round washers, spaced about 12ins. to 15 ins. apart up seams for single overlap, and about 7½ins. to 9ins. apart zigzag for double overlap; and one bolt to each corrugation (placed zigzag) in the end laps. A good method of keeping the roof water-tight is to place a small round washer of lead between the sheets and the iron washer of all sheeting bolts and hook-bolts. The average weights of galvanised corrugated sheeting per square (100 sq. ft.) of roof surface when laid (exclusive of end laps), and allowing for sheets with 10ft. 3ins. corrugation, will be as follows:—

Gauge.	Single laps.	Double laps.
No. 24 ...	134lbs. ...	149lbs.
No. 22 ...	167lbs. ...	185lbs.
No. 20 ...	200lbs. ...	223lbs.

The sheeting bolts and nuts, with two washers to each (one iron and one lead) for each square (100 sq. ft.) of roof surface will be as follows:—For single corrugation side laps=½ gross and weight=4lb.; for double corrugation side laps=¾ gross and weight=6lb. All galvanised corrugated sheets to be free from acid spots, blisters, cracks, and defects of every kind, and should be perfectly square on the edges.

A Simple Form of Ventilator

for this type of roof is shown in Fig. 17, and is formed by leaving out a short portion of a sheet in one of the tiers at the crown of the roof, and covering the opening with two sheets, supported on light flat iron Z-shaped clips, which are fixed to the sheets with small galvanised bolts and nuts. When the sheets are fixed at the eaves to a timber eaves beam, the latter is chamfered about 1in. wide at the outer edge to form a bearing for the sheets, and the sheets are fixed to same with 2½in. long by 5-16in. diameter coachscrews and corrugated washers, spaced 9ins. apart, or at every third corrugation in the smaller spans. For the larger spans, 3ins. long by 5-16in. diameter coachscrews and corrugated washers should be used and spaced at 6ins. apart, or at every second corrugation (see Fig. 8). It should be observed that all screws and bolts and nuts are placed at the apex of the corrugations, and not in the valleys. In the case of a roof on walls, the sheets are fixed at the eaves to an angle steel purlin bar, which may be 2½ by 2½ by ¼ L section for 10ft. spacings of bracings, and 3 by 3 by ¼ L for 12ft. and 15ft. spacings. The sheets are fixed to this purlin by means of light iron clips, with two small galvanised bolts, nuts, and washers to each, the clips being spaced about 15ins. apart for the full length of the roof (as shown in Fig. 18); and a similar fixing is made in the case of a roof on steel stanchions; but as the sheets usually rest on the heel of the angle bar, clips as shown in Fig. 19 are used, these being spaced alternately at 15ins. apart centres for the full length of the roof.

Gutters and Downpipes

for this type of roofing are usually made of galvanised sheet-iron. The gutters are of half-round section, and may be No. 20 gauge thick for the smaller spans, and No. 18 gauge for the larger spans, the downpipes being Nos. 24 and 22 gauge, respectively. For spans up to 18ft. 4½ins. wide gutters, with 2½ins. diameter downpipes, may be used; for spans from 18ft. up to and including 25ft., the gutters may be 5ins. wide, with 3ins. diameter downpipes; and for all spans above 25ft., the gutters should be 6ins. wide, and have downpipes 3ins. diameter. A good rule for determining the sizes of gutters and downpipes is as follows:—Downpipes should have a bore or internal area of at least one sq. in. for every 80 sq. ft. of roof surface in temperate climates, and about 40 sq. ft. in tropical climates. They should be spaced from about 30ft. to 40ft. apart, and should have gutters about twice the diameter of the pipe in width. Gutters should have a fall of at least 1in. in 15ft.=1 in 180, and are supported by light iron straps, or hooks, spaced about 3ft. apart, bolted to the sheets, screwed to the timber eavesbeam, or hooked to the eavesbar, as shown in Fig. 20, the downpipes being fixed at intervals of about 6ft. with the ordinary types of holdfasts. Sections and particulars of larger spans might have been given, but the writer does not recommend this type of roof for spans much exceeding 30ft., and has therefore made this the limit. No theoretical calculations have been given, as this type of roof is designed entirely for practical experience, and on this account it is hoped that the foregoing particulars will prove beneficial to those interested in light iron roofing work.

Law Case.

A Quantity Surveyor's Claim.

The case of Bramall v. Gowing was heard before Judge Ruegg, K.C., in the Birmingham County Court on the 4th inst. It was a claim by W. H. Bramall, quantity surveyor, of Manchester, formerly of Coventry, against F. Gowing, builder, of Birmingham, for damages for breach of contract, or alternatively for wrongful dismissal. The defendant was contractor for the erection of a new factory in Coventry, for Humber, Ltd. He engaged plaintiff at a salary of £3 15s. per week during the progress of the works to measure up the work done and adjust the measurement with the architect. The defendants' case went to prove that the plaintiff's measurements were inaccurate, that he had omitted a whole floor, 3,700 yards in extent, and that after Mr. Dix, the architect to Humber, Ltd., had informed defendant that there were a lot of items against him, plaintiff was requested to meet Mr. Dix to go into these matters, and, refusing, was dismissed. Mr. Wiliam Iles, surveyor, employed by defendant, and Mr. Dix, surveyor to Humber, Ltd., said they checked plaintiff's figures and found them wrong. The granolithic floor was omitted, and that would have been a loss of £900. His Honour, giving judgment, said no case of dishonesty or falsification by defendant had been made out. He found plaintiff was wrongfully dismissed, and assessed damages at £25.

On the application of Mr. Maddocks, counsel for the defendant, a stay of execution for fourteen days was granted.

The Palace of Holyrood is being treated with a view to the prevention of further decay, and it is expected that the work of this character will occupy about a year. The larger question of restoration is still the subject of keen controversy.

Matters of Opinion.

No. 1 (continued).—The Increased Employment of Specialist Contractors.

We have received the following letter from the Liverpool Master Builders' Association:

Dear Sir,—The correspondence which has been appearing recently in your Journal on the above subject has received the consideration of the Council of this Association, and I have been requested to lay some views of the members of this Association before you.

It is a fact beyond doubt that the above heading, with special emphasis on the first words, indicates the present position of this question, and this increasing custom is inflicting great hardship on the general building contractors for the following reasons:—

The general building contractor has to:

(a) Bear the responsibility of the work;
(b) Cut out, attend on, and make good after;
(c) Provide scaffolding;
(d) Pay carriage on goods, also on return crates, etc.;
(e) Bear the responsibility for the storage, safe keeping and good condition of all the goods bought by the architect from so-called "Manufacturing Specialists";
(f) Pay all accounts relating to the above;
(g) Bear responsibility for delays.

For these items and many others the general building contractor in most cases receives absolutely no remuneration.

It is admitted that the general building contractor has in the majority of cases the option of adding profit and a certain sum for attendance on specialists, but this option is very seldom taken advantage of by the builder, because he is working entirely in the dark as to what is the proper amount to include. On the other hand, the architects are in a position to know what the cost of attendance on such specialists is likely to be, and if they insist in continuing to employ specialists in the way they do now, they ought to include in the prime cost sums a sufficient amount, not only to pay for the specialists, but also to pay the general building contractor a reasonably assured profit on the work relating to each specialist. This is the only feasible solution with fairness to the general building contractor, if he is to be responsible for the specialists' work.

If, however, architects will not agree to this equitable way of dealing with the growing injustice referred to, there is only one other reasonable course in the general building contractors' interests, open to them, and that is to exclude all lump sums in the quantities for specialists, and omit all clauses in the contract relating to specialists, and for the architect to let this work direct and issue certificates—in a few words, the general building contractor to have nothing to do with the specialist at all.

Yours faithfully,
BERTRAM B. MOSS,
Secretary

Sir,—In your issue of the 9th ultimo, you publish an opinion on this question from the Bury and District Master Builders' Association, who states, in a concluding paragraph, that the "question of proper quantities often enough puzzles the builder," and who gives examples of items which are, presumably, extracted from a bill of quantities issued in the north of England. The system of taking off quantities in the north varies somewhat from the method adopted in London and its vicinity, and those who favour the latter, claim that their bills are prepared much more in detail than the ones supplied by their provincial brethren. There are many competent and reliable quantity surveyors practising in the north whose work, however, is fully equal to that of many leading surveyors in London, and no bill of quantities issued by one of these gentlemen would contain items such as those quoted by the Bury Association, viz. :—

"No. 1.—Tracery windows to detail complete;

"No. 1.—Oak entrance door with frame casings, lock or complete."

The inclusion of items such as these afford ample evidence that the person by whom these bills were prepared is utterly lacking in training, and has failed to grasp the primary object to be attained in the preparation of bills of quantities, i.e., the production of a document embracing a record of all the material and labour required in the erection of a building, and in which the items should be sufficiently clearly described so that an estimator may price the set without referring to the drawings.

The bills of quantities of which your correspondents complain are certainly not prepared by a quantity surveyor, and this fact seems to point to the necessity for the increased employment of the specialist in quantity surveying. If all the leading contractors in one district were to refuse to tender for work for which quantities accurately prepared were not supplied, the irresponsible and incompetent surveyor would cease to exist.

ARTHUR G. CROSS, F.S.I.
Caxton House, S.W., Jan. 2nd, 1909.

Views and Reviews.

Old Essex Buildings.

Although the architectural interest of these "Memorials of Old Essex" does not predominate, it is by no means insignificant. There are chapters, by various hands, on the ancient churches, the monumental brasses, and the historic houses in the country; and the many illustrations include several interesting churches, such as Greenstead, which is remarkable as containing the only remaining wooden-walled nave of Saxon type; Ashingdon, with its conical-roofed Saxon tower; and South Ockenden, with its remarkable round tower. Red brick towers, it is observed by Mr. T. M. Grose Lloyd, who writes the extremely interesting account of the "Ancient Churches of Essex," are a unique characteristic of the county. These brick towers, and the timber towers and turrets, are the most characteristic features of its churches. The wood towers and turrets are often covered with shingles, a term that the author rather quaintly defines as "tiles of cleft oak," a kind of roof-covering that nowadays is much more common in America than it is in this country. The porch of Feering is vaulted in brick; the tower of Sandon is domed over in brick, and Chignal Smealy is built entirely of brick, even to the font. Also the churches are apt to be lop-sided. About half of them were built without aisles, and there are now more north than south aisles. The towers are commonly at the west end, and project from the nave, only a few of the cruciform churches having central towers. The county may be said to be extraordinarily rich in Norman churches, Waltham Abbey being, of course, incomparably the most notable example. A spirited drawing of the nave pillars of the Abbey, contributed by Miss Jessie Godman, is perhaps the best illustration in a book that in this respect is uncommonly well supplied. Altogether, this is a fascinating volume—the kind of book which we are inclined to suspect the architect prefers to the more purely professional treatises. Those he must study; this he may enjoy.

Memorials of Old Essex. Edited by A. Clifton Kelway, F.R.Hist.S. With many illustrations. London: Bemrose and Sons, Ltd., 4, Snow Hill, E.C., and Derby.

Bridge Construction Problems.

The aim of the present book is "to furnish easily understood rules whereby problems connected with bridge construction may be treated analytically and graphically," the need of such a book having been felt by the author in his capacity of lecturer on civil engineering at the Swansea Technical College. After defining terms employed, the author deals with stresses in beams and in framed structures, cantilever bridges, moment of inertia, etc., strength and fatigue of timber, iron and steel, strength of columns, riveted joints, etc., deflections of beams, continuous girders, loads on bridges, arches, suspension bridges, draw bridges, travelling bridges, floors of bridges are next considered in detail; and the book concludes with the calculations in typical bridges. The work is well printed and clearly illustrated, although some of the figures suffer rather from severe reduction.

The book is one which should prove of considerable use to engineers engaged in bridge design; it is, however, more of a treatise than a text-book, and would not, we think, be of so much value to students of constructional engineering because most of the theory is not explained at length. For instance, although in the chapters on framed structures many reciprocal diagrams are shown, and many cases are worked by the method of moments or sections, there appears to be no description of such diagrams or method, nor do they appear to be referred to as such.

We think that the book would be much improved if more references to other works were given where the principles of the rules used are set out at length, and if distinction were drawn between rules which are theoretically accurate and those which are only approximate. On page 29, for example, we note the rule that : "To determine the equivalent centre load in the case of a beam loaded symmetrically or unsymmetrically at different points, multiply each load by twice its distance from the nearest point of support, sum the products and divide by the span." This rule is not accurate, but only approximate, and would rather perplex the reader who tried to see the principle involved in it

The question of rolling loads does not appear to be very clearly dealt with; in some of the examples the axle-loads are given, but it is not clear that they are really used.

The chapter on arches is a good one, and should be of considerable assistance, especially as the British textbooks do not deal very much with this subject.

There are in the book a large number of detail drawings and descriptions of and calculations for typical bridges in timber and steel which are of considerable value and interest, and which must have taken much patient labour to collect. We think that the book is a useful addition to the literature on bridge design; many of the largest and best previous books on the subject have been of American origin, and the difference in the practice and technical terms between the two countries has lessened their value in this country.

The preface informs the reader of the very sad circumstances under which the book was produced, the author living only just long enough to complete a work that had taken eight or nine years to prepare.

The Theory and Practice of Bridge Construction, by Morgan W. Davies, A.M.I.C.E.; 594 pages. 12s. nett. (Macmilan and Co., Ltd., London.)

A premature announcement in the press to the effect that the Shakespeare Memorial Committee had decided in favour of a scheme for the establishment of a national theatre has been contradicted by Mr. Philip Carr, the secretary of the Committee, who, writing on January 7th, stated that "no meeting of the General Committee has yet been held to consider the details of a scheme, and that consequently no scheme can be said to have been adopted."

Federation News.

Oldham Master Builders' Association.

A deputation from the Master Builders' Association and the Trades Council appeared before the Oldham General Purposes Committee last week to discuss a new Fair Contracts Clause which the Trades Council had promoted. The clause, in addition to asking that contractors shall pay standard wages and observe the usual conditions of labour in the district urged that contractors shall not sub-let a contract without consent of the Council and in connection with an sub-contract, shall be held responsible for the observance of the various conditions as though the contract was being carried out by themselves. The clause also asked that contractors and sub-contractors shall recognise the absolute freedom of the workpeople to be members of trade unions, and that a breach of conditions shall render a contractor liable to lose his work or a penalty not exceeding £500.

Mr. J. R. Clynes, M.P., who supported the clause, said no fair employer need be afraid of it, while Mr. S. Smethurst, of the Master Builders' Association, said if the Trades Council became too exacting employers would have to retaliate. The committee decided to further consider the clause.

Proposed New Works.

Belfast.—Mr. W. J. Fennell, F.R.I.B.A., of Belfast, is preparing plans for new schools for the vestry of All Saints' Parish.

Birkenhead.—The ratepayers of South End are petitioning the Corporation for the erection of public salt-water baths.

Bishopstoke, Hants.—A proposal to erect here a church tower in memory of the late Admiral Keppel is receiving encouraging support.

Bournemouth.—The Town Council has agreed to a scheme for the erection of a Kursaal, costing £45,000, on the Bellevue site, near the pier approach.

Cahirciveen, Ireland.—Mr. R. M. Butler, architect, Dublin, is preparing plans for a new free library here.

Cirencester.—The U.D. Council have approved plans for the following: Additions to house in Dyer Street, for Mr. C. Baldwin; additions to house in Victoria Road, for Mr. E. L. Weskett; office in Ashcroft Road, for Mrs. Avery; additions to tramp ward at the workhouse; alterations and additions to house in Cecily Hill for Mr. W. H. Saunders; and shop, etc., in Black Jack Street, for Earl Bathurst.

Coventry.—The Town Council are contemplating the erection of new municipal offices and are at present looking for a suitable site.

Dublin.—The Committee of Management of the Richmond District Lunatic Asylum have applied to the Local Government Board for a loan of £54,720, for extensions and alterations to the Dublin and Portrane Asylums.

Eastbourne.—The Town Council have approved plans for the following :—D. E. Williamson (Spalding, Spalding, and Myers, architects), additions to York House, Royal Parade. A. Max Wilkinson (C. Breach, builder), addition to Warren Hill. A. W. Cheetham, detached house, Baslow Road. Vicar and Wardens of Holy Trinity Church (A. R. G. Fenning, F.R.I.B.A., architect), alteration and addition to Holy Trinity Church. A. E. Potter (Mitchell and Ford, architects, A. E. Potter, builder), ten houses, Desmond Road. Beach Laundry Co. (J. D. Thompson, builder), addition to the Beach Laundry, Royal Parade, East. A. de Mierre (F. G. Cooke, architect, B. Stevens, builder), detached house, Ashburnham Road.

Eccles.—The L.G. Board have agreed to the erection, by the Corporation, of 12 artisans' dwellings in Corporation Road.

Huddersfield.—An extension of the General Post Office is in contemplation and the Treasury have secured a site in Northumberland Street for the erection of a new building, which will be used for the general postal business. The present buildings will then be devoted to the telegraph and telephone services.

Lanchester (Durham).—The Durham County Education Committee have passed plans for new elementary schools at Langley Park, and Blomfontein, Craghead.

Madrid.—The Bishop of Gibraltar is appealing for funds for the erection of an English church at Madrid. About £3,000 is required.

Mexborough.—The Education Committee have in hand a scheme for a new secondary school to accommodate 360 scholars. Plans have been submitted by Mr. Stewart, of the county architect's office, Wakefield.

Perth.—The directors of the City and County of Perth Royal Infirmary have resolved to proceed with the erection of a new infirmary on a site at Tullylumb. The infirmary is to contain 100 beds, at an estimated cost of £400 a bed.

Portadown, Ireland.—Mr. J. W. Walby, architect, of Portadown, has been instructed to prepare plans for a new dispensary, at a cost of £1,000.

Prestwick.—A new sea wall is to be erected here at a cost of £5,000. Mr. William Cowie, architect of Ayr, has prepared the plans.

Royton, Oldham.—A proposal is on foot to rebuild the Church Institute, at a cost of £2,000, on a new site, which has already been purchased.

Shanklin, Isle of Wight.—It is proposed to erect a kursaal with marine gardens at Shanklin, plans for which have been prepared by Messrs. Frank Matcham and Company, of London, and approved. The kursaal is to be erected on a leasehold site on the esplanade, the auditorium to have a seating accommodation of 650, and stage accommodation large enough for any of the first-class London touring companies. There will be reading, smoking and other rooms, with a balcony on the sea front overlooking the English Channel. A high-class club will be formed for residents and visitors, and the adjoining grounds will be laid out as ornamental gardens, with tennis and croquet lawns and bowling greens.

Stockport.—Improvements to the General Post Office are contemplated, and the Town Council has intimated to the postal authorities that if they will carry out a widening improvement and erect a new post office, the Council will present them with a site for the new buildings.

Tulsk, Ireland.—Tenders have been received for new R.C. Schools.

Tuxford, Notts.—A committee of Sheffield City Council that has in hand the matter of providing a sanatorium for the treatment of consumptive patients, has recommended a site at Tuxford, Notts. The site is about 34 acres in extent.

Wicklow.—Tenders are to be invited for new schools here, plans having been approved by the National Board of Education.

Wigan.—The Parish Church tower, which has been effected by the coal smoke, has been the subject of a long report by Mr. W. D. Caröe, F.R.I.B.A., F.S.A. Mr. Caröe proposes to treat the stonework with chemicals at a cost of £650, a sum of £25 to £50 to be used for preliminary experiments in treatment.

Yardley.—Mr. A. G. Drury, Local Government Board inspector, has held an inquiry relative to an application by Yardley Rural District Council for leave to borrow £2,240 for works of sewerage in Stechford, £325 for purchase of land to be used as a depot, and £6,718 for recreation ground purposes.

Works in Progress.

Bacup.—The town of Bacup is committed to a considerable number of important enterprises. The waterworks scheme, nearing completion, has already cost £230,000. The Bacup steam tramways are to be electrified at a cost of £10,000, and the road from Bacup to Waterfoot is to be reconstructed at a cost of £24,000. A new elementary school is to be erected in Burnley Road, costing £7,000, and the river is to be arched over and a new post office built. Application has also been made by Bacup, jointly with Rawtenstall, for power to borrow £26,000 for a new technical institute, to be erected centrally at Waterfoot. In addition, 100 residences are to be erected on the garden city principle on the Esther estate, and the Ross Spinning Mill, which is now roofed in, is to hold 130,000 spindles ultimately, and give employment to 600 hands. Such a combination of enterprises is unprecedented in the history of Rossendale.

Burton.—A start has been made on a new Roman Catholic school in Guild Street, and work has also begun on the new police station and courts, on which it is likely that fifty men will find employment.

Burton-on-Trent.—Some important business premises have been completed in Market Square from the designs of Mr. Fourshaw. The new buildings have facings of red brick with Hollington stone dressings and "Edwardian" chimney pots have been used. The steelwork engineers were Messrs. Mark Fawcett and Co., and the "Fawcett" fire-resisting floor is used throughout.

Capetown. — Four stained glass windows, designed and painted by Messrs. Karl Parsons and C. W. Whall, of London, and executed by Messrs. Lowndes and Drury, of Fulham, London, have been placed in windows in the apse of St. George's Cathedral.

Clatford.—The ancient church tower at Upper Clatford has been restored. The last restoration of the tower was about the Stuart period, as proved by the discovery of an old stone with an inscription embedded in the wall in the belfry. A thirteenth century pillar piscina was also discovered. In the Stuart restoration it had probably been removed from the interior of the church, and was broken in halves to form the sides of a window, presumably for purposes of economy. The wish of those who hoped the tower would not be improved out of knowledge has been respected, for while the work has been thoroughly done, the only important change has been the scraping off of the plaster, exposing the original flint surface.

Denbighshire. — The education authority have opened during last week four new Council schools in the Eastern portion of the county, and one in the Western portion. Two others will be ready for opening during the month, making a total of seven new council schools from the designs and under the supervision of their county architect. Mr. Walter D. Wiles, one of which is on the Central Hall, and the others on the corridor principle; these new schools have been built in single school areas, mainly by the aid of the McKenna Government grant.

Deptford, S.E.—The new bridge over the Grand Surrey Canal, at Trundleys Road, which has just been opened for traffic, is 32 ft. wide, with a carriageway of 24 ft. The bridge it supersedes was only 12 ft. wide, including the footways. Messrs. Dick, Kerr and Co., are the contractors, and have built the bridge to the order of the London County Council.

Ebbw Vale.—A new Congregational chapel here, of which the foundation stone has just been laid, will seat 650, and the basement will contain a hall to seat 500. The cost is estimated at £3,364. Mr. T. Roderick, of Aberdare, is the architect, and Messrs. S. T. Davies and Son, of Ebbw Vale, are the builders.

Gateshead.—For the new wing of the Gateshead Children's Hospital, opened on Dec. 16th, Messrs. Watson and Scott, of Newcastle, are the architects, and Messrs. Raven and Hitcham, of Gateshead, are the general contractors.

Glasgow.—A new clubhouse for the Old Kilpatrick Conservative Association, in Klbowie Road, Clydebank, includes a hall capable of seating 300 persons, and has cost, altogether, about £2,000. Mr. D. Andrew, junior of Glasgow, is the architect. There is a shop on each side of the front entrance.

Hampstead.—The lowest of thirty-five tenders has just been accepted for the erection of a temporary church at Golder's Green. The total cost will be about £2,000. Mr. Herbert Wills, of Wills and Anderson, is the architect.

Hampstead, London, N.W.—The Central Library extension at Finchley Road was opened by the Mayor of Hampstead on Jan. 1. The facade of the new wing corresponds with the original work. The lower floor will be used as a Children's Lending Library, and has a separate entrance from Arkwright Road. On the floor over is a committee room. An iron staircase in this committee room leads to two new store rooms over the entrance corridor. The store room which formerly served as a committee room is now divided into a book store and a new staff room, the space of the former staff room being added to the Lending Library. The buildings have been designed by Mr. Arnold S. Tayler, A.R.I.B.A., of Old Queen Street, Westminster, and carried out by Mr. H. L. Holloway, of Deptford, Mr. E. L. Cooper acting as clerk of the works.

Handsworth.—The new King Edward's Grammar School for Girls, upon which work is about to be commenced, is to be built of brick, with stone facings, and is estimated to cost more than £30,000.

Isle of Man.—The Tynwald Court Committee have accepted the tender of Mr. R. F. Douglas for the erection of the new Government buildings and deed rooms. The new buildings include, beside the new Rolls Office, an addition to the Keys Chamber, to provide accommodation for the Press, lavatories, etc., and new accommodation for the Speaker. The designs have been prepared by Mr. H. Cowle, the Government architect.

London, E.C.—Further repairs to the west front of St. Paul's Cathedral have been put in hand, the cornice of the great west door being the immediate work under reparation. Mr. Mervyn E. Macartney, F.R.I.B.A., F.S.A., is the architect to the Dean and Chapter.

London, W.C.—The contract for the British Museum Extension in Montague Street has been let to Mr. W. E. Blake, of Plymouth, for £118,000. The new building is to have a plinth of polished Scotch granite,while the upper part will be of Portland stone. All the joinery work, etc., will be made in Plymouth. Mr. J. J. Burnet, A.R.S.A., F.R.I.B.A., of Glasgow, is the architect.

Morecambe.—The tower and grounds have been purchased by a London syndicate, and considerable alterations are being carried out by Messrs. Hawkins and Co., of Westminster, London.

Morley, Yorks.—A new secondary and technical school was opened here on the 4th inst. The new structure will accommodate 200, and there is room for an extension for 150 more. It is a plain but substantial building. Occupying a site of nearly three-quarters of an acre, the ground floor space includes an engineering laboratory and workshop, textile laboratory, science lecture-room manual and plumbing workshop, millinery and dressmaking room. The great feature of the first floor is a spacious assembly hall, surrounded by classrooms, etc., over which are situated a chemical laboratory, physics laboratory, lecture theatre, elementary and advanced art rooms, gymnasium, laundry, and cookery room. The total cost, including site and equipment, is £15,500. Mr. W. E. Putnam, borough engineer, was the architect.

Paddington.—The Great Western Railway is carrying out an extensive plan for the improvement of Paddington Station. Work in connection with this scheme has been in progress for some years past, and has led to the important extension on the Bishop's Road or arrival side of Paddington, which is now being worked out for contract. This will constitute the first enlargement of Paddington Station since its construction in the year 1854. Bridge renewals in the vicinity of the terminus have been in progress for a considerable time past. The various over-bridges, which have been reconstructed, are mainly on the short piece of line between the terminus and West London junction, some 2¾ miles distant. The bridges, the reconstruction of which has already been completed, are the Bishop's Road, Scrubb's Lane, Mitre, Green Lanes, Westbourne Park, and the Hampton Street foot-bridge. The various bridge reconstructions were a necessary preliminary to the rearrangement of the approach lines to the terminus. The work which is to be put in hand at the terminus itself includes the provision of three extra platforms and lines, an extension of the station roofing over the new road, and the construction of a new carriage road which will entail undercutting the public roadway beside the station. Some improvements have already been carried out in the traffic arrangements at Paddington Station, among these being a subway and luggage lift to five of the platforms, while the lighting of the terminus has been considerably improved by the instalment of a new form of arc lamp. The general scheme has included the transference of the locomotive and carriage depot to Old Oak Common, Acton, and the dismantled site at Westbourne Park is to be utilised as a mileage yard, the work in connection with which has now been completed. The electric lighting station, which was formerly adjacent to the terminus, has been removed to Park Royal, a step taken in conjunction with the construction of a large generating station for the supply of current for the working of the Hammersmith and City Joint Lines.

St. Austell.—A new china-clay kiln that has just been started here is 380 ft. long and 18 ft. wide, and has a shed capacity for 10,000 tons. There are six large tanks adjoining the kiln, which, when filled, contains about 8,000 tons. The stack, which has been built of Pentewan concrete blocks, is 120 ft. high. In the construction there have been used 12,000 tons of stone, 3,000 tons of sand, and more than 300 tons of cement.

South Shields.—Difficulties have arisen over the completion of the Municipal Buildings, the architect, Mr. E. E. Fetch, having ordered the contractors, Messrs. Neill and Sons, to remove certain woodwork, which he condemned. The contractors appear to have removed only part of the defective woodwork, and in one part only has the woodwork been renewed. After calling in Mr. C. J. Wade, a timber expert, of London, to report on the matter, the Council have instructed the Town Clerk to give notice to the contractors that unless the terms of the architect's order of the 1st December last are complied with within fourteen days from the receipt by them of notice, the Council will put in force the power given to them by condition 16 of the contract, viz., to employ and pay other persons to carry out the orders of the architect, and that all expenses consequent thereon and incident thereto will be charged to the contractors in accordance with the terms of such condition.

Stoke (Devonport).—The foundation stone has been laid of a higher elementary school which is being erected here at a cost of £11,180.

Sunderland.—Mr. Charles A. Harrison (chief engineer of the North-Eastern Railway) has just laid a memorial keystone in the new high-level bridge over the Wear, which is rapidly approaching completion.

Wandsworth, S.W.—The new poor-law infirmary in St. James's Road, of which the foundation stone has just been laid, is being built by Messrs. W. Johnson and Co., Ltd., of Wandsworth Common; from the design of Mr. J. S. Gibson, V.P.R.I.B.A., of London. The tender amounts to £66,550.

Watford.—A local firm of builders, Messrs. C. Brightman and Son, have secured the contract for the erection of a new station here for the Watford and Euston Electric Railway. The work, which is to be completed by January, 1910, will be put in hand almost immediately.

Watford.—The Local Government Board have refused a loan of £16,500 to the Urban Council, for the purchase of 50 acres of the Cassiobury Estate for a people's park. They consider the price too high, as the vendor's profit would be £60 an acre. A deputation from the Council is to wait upon the Board.

Weymouth.—The pier pavilion recently opened here, has a total seating capacity for 1,100 persons. It has been designed by Messrs. Magnall and Littlewoods, of Manchester, with the assistance of Mr. W. Barlow Morgan, M.I.C.E., the borough engineer of Weymouth.

Winchester.—The west wall of the south transept of Winchester Cathedral is to be shored up as well as the great south gable. This portion of the Norman fabric has always presented a somewhat unstable appearance, and its actual condition has now been ascertained to be altogether dangerous. The under-pinning processes now in operation, and the scaffolding and struts both within and without the walls, form a really remarkable sight. Some 180 men are employed in and around the cathedral on the restoration works.

Truro.—The parish church of St. Erme, situate about 3½ miles from the city of Truro, has undergone extensive renovation, at a cost of nearly £1,000, and has just been reopened. The present building, which stands on the original site of a mediæval church, was entirely reconstructed in the early part of the last century, and was opened for Divine service on February 20th, 1820. The embattled tower, built in the fifteenth century at a much later date than the old church, did not, however, require rebuilding in 1820. In the present renovation the walls have been made good and strengthened, and the east gable, which was falling outwards, has been restored. As the entire east wall had also a tendency to fall out two new buttresses have been built against it. The old flooring has been taken up and a new floor laid down on a bed of concrete. A marble pavement has been placed in the chancel, and the heads of the windows, which were plain, have been fitted with granite tracery. The windows have all been fitted with old glass which came out of the windows of Truro Cathedral as they were from time to time fitted with new stained glass. In addition to several minor improvements an entire new slate roof has been put on the church. The church is dedicated to St. Erme, who is said to have lived in the reign of Trajan, and by his strong attachment to the Christian cause awakened the vengeance of the Pagan emperor, who committed him to prison for refusing to sacrifice to idols, and in the reign of his successor, in the year 118, he was beheaded for persisting in his opposition to idolatry. The church of St. Erme was extant and endowed long before the Norman Conquest, and the district was taxed in the Doomsday roll under the name of Ermen-hen, signifying old or ancient Erme.

Trade and Craft.

Patent Treads.

With reference to our article on the new factories at Kinlochleven, N.B., for the British Aluminium Co. we are asked to state that the Andrews-Hawksley Patent Tread and Engineering Co. supplied all the floor plates for the Electricity Power Station. These are now being largely used for this class of work, beng non-conducting, self-supporting, and reversible. We may say that among some of the important electricity power stations, where this form of floor plate has been adopted, may be mentioned the Great Western Railway power stations at Royal Oak, Shepherd's Bush, etc., also the Millbank Generating Station, Westminster, under C. Stanley Peach, Esq., F.R.I.B.A., and the Islington Borough Council Electricity Power Station.

Architectural Societies.

The award of prizes and studentships for 1908-–09, will be made at the next ordinary general meeting on Monday, January 18th, on which occasion, also, Mr. R. Stephen Ayling, F.R.I.B.A., will read his paper on "Public Abattoirs." Nine essays have been received for the essay prize, nine sets for the measured drawings prize, ten designs for the Soane Medallion, one application for the Owen Jones studentship, nine sets of drawings for the Pugin Studentship, twenty designs for the Tite prize, one application for the Godwin Bursary, and nine designs for the Grissill prize. The following gentlemen have been nominated for election. Objections to the election must be received before the 1st prox. The day of election is the business meeting on Monday, March 1, next.

As Fellows (3).—Dinwiddy, Tom Norman (A. 1901), London; Howell, William Roland (A. 1891), Reading; Willock, Richard (A. 1889), London.

As Associates (44).—All the candidates have passed the examination qualifying for Associateship.—Allner, James, Blandford, Dorset; Ash, Horace James, Nuneaton; Beswick, Alfred Edward, Swindon, Wilts; Bownass, James Everett, Windermere; Buckingham, Ernest Hugh (Special Examination), Norwich; Bush, Frederick Thwaites, London; Coldwell, Edward Smith, London; Daft, William Austin, Oxford; Dalton, Percy, Ainsdale, near Southport; Davies, Horace Francis, Chester; Dean, William, St. Leonards-on-Sea; Denman, John Leopold, Brighton; Foster, Reginald Charles, Loughton, Essex; French, Harold, London; Graham, Allan, London; Groves, Christopher, Newcastle-on-Tyne; Healey, Hugh, Rochdale; Hill, Thomas Harold, Manchester; Hosking, Thomas Stanley, Llandrindod Wells; Hunter, George Edward, Newcastle-on-Tyne; Ixer, Sydney Henry Howard, London; Lay, Harry George, Wellingborough; Major, William Paul, Bristol; Mobbs, Sydney Wilfred, Lowestoft; Mole, Charles Johns, Plymouth; Morley, Eric, Bradford; Neave, Stacey Arthur, Sydney, New South Wales; Penfold, John Thomas, London; Potter, Francis John, London; Ruddle, Alan Wilfrid, Peterborough; Smith, Charles Benjamin, Ipswich; Surman, John Burgess, Birmingham; Sutcliffe, William, Todmorden; Sutton, Basil Hope, Reading; Sykes, Frank, Manchester; Thomasson, William Joseph Mate, Bournemouth; Tyndall, Richard John, London; Vanes, Robert Newton, London; Vaughan, James Henry, Newport, Mn.; Ward, Frank Dorrington, Hastings; Warren, Henry George, London; Whittaker, Thomas Herbert, Nottingham; Wilson, William Hardy, Sydney, New South Wales; Wood, Ernest Marshall, Cardiff.

As Hon. Corresponding Members (2).—Delphy, Adrien, Architecte, Archéologue, Laureat de l'Académie des Beaux-Arts de Bruxelles 1879; of 63 rue Belliard, Brussels; Girault, Charles Louis, Architecte du Gouvernement, Membre de l'Institut de France, Officer de la Légion d'Honneur; of 36 Avenue Henri Martin, Paris

The Royal Institute solicitors have received an intimation from the clerk of the Privy Council that His Majesty the King has been pleased to approve the grant of a supplemental charter as prayed for. This supplemental charter provides for, among other things, the creation of a new order of members—Licentiates.

The annual exhibition of designs and drawing submitted for the Institute prizes and studentships, 1908-1909, opens on Tuesday, 19th January, in the Gallery of the Alpine Club (entrance in Mill Street, Conduit Street, W.). Open each day from 10 a.m. to 8 p.m., the exhibition closing on January 30th.

* * *

The Architectural Association.

At the ordinary general meeting of the Architectural Association, held on January 8th, the following gentlemen were unanimously elected:—Mr. W. G. Newton, 13, Earl's Terrace, Kensington, W., proposed by Mr. Gerald C. Horsley and Mr. Ernest Newton; Mr. W. J. Price, 35, Airlie Gardens, Ilford, E., proposed by Mr. Arthur Stratton and Mr. R. Elsey Smith; Mr. M. F. Surveyor, 19, Craven Street, Strand, W.C. proposed by Mr. Leonard Stokes and Mr. W. Howard Seth-Smith.

The president (Mr. Walter Cave), then announced that the A.A. life class would have to be discontinued. unless more students joined. The class was run at a loss if there were less than twenty-four members, and at present there were only seven members. He then proposed votes of condolence with the widow and family of the late Mr. W. M. Fawcett, and with the family of the late Mr. E. A. Gruning, which votes were carried in sympathetic accord by the whole meeting. The President then commented briefly upon the lives of the deceased gentlemen, and pointed out that Mr. Fawcett had executed some admirable work at Cambridge.

Mr. Searles-Wood, before reading his paper on "Building Materials" (of which the first portion appears on another page), hoped he might supplement the President's words by a few remarks. Mr. Fawcett, he observed, was a great admirer of the A.A. excursions, and for many years past had been a regular member of the ordinary annual excursions, and the excursion to Italy. It was due to Mr. Fawcett, he believed, that Mr. J. D. Sedding was introduced to the A.A. He was not quite certain of this, however,—possibly it was that Mr. Fawcett's introduction should be credited to Mr. Sedding.

It was announced that at the next ordinary general meeting, on January 22nd, at 7.30 p.m., the paper to be read is one on "Reinforced Concrete," by Mr. J. H. Markham. Mr. Buckland's paper on "Schools," originally set down for that date, is to be read on February 5th.

* * *

Glasgow Institute of Architects.

The members of the associate section of the Glasgow Institute of Architects recently visited the Merchants' House of Glasgow—the reconstruction scheme of which is now well forward—and the new offices of the Clyde Trust, in Robertson Street. The visitors were shown through the Merchants' House by Mr. Blane, of Messrs. John Burnet and Son, architects. When the alterations and reconstruction are completed, the building, which is situated at the north-west corner of George Square, will consist of the old basement, ground, first and second floors reconstructed and improved, with three additional storeys of offices. The additional storeys are fast approaching completion. The original building was erected about thirty years ago. Fronting George Square and West George Street a new facade has been carried out in modern Renaissance style, to harmonise with the old portion, the three new storeys being grouped together with a row of Ionic columns extending the full length of the frontages and gripping in the old tower at the angle of the building. The staircases are finished in grey and white marble up to the level of the Merchants' Hall, and above that in grey and white tiles. The hall itself has been entirely reconstructed with a view to improving the lighting and acoustics. Formerly there was a heavy timber roof rising 52ft. from the floor to the ridge. The ceiling has been lowered by 20ft., and now that the hall has been tested, the acoustics have been found to be most satisfactory. Mr. John James Burnet, A.R.S.A., is the architect.

* * *

Liverpool Engineering Society.

In a paper on "Pile Wharves in Tidal Waters," recently read before the Liverpool Engineering Society, Mr. Somers H. Ellis dealt only with the open-work or framed structures and their materials. Given favourable conditions, a solid wall of masonry or concrete was obviously the best. The advantages of timber for wharf making were cheapness, ease and rapidity of construction, feasibility of inspection and repair, and a high degree of elasticity. But in clear sea water timber was attacked by the teredo and other pests. The author has found that only aranga wood was able to resist the ravages of marine borers, but that wood could not now be obtained. Turpentine wood, a product of New Zealand, was said to be immune, but greenheart, Jarrah, Billian, and other heavy woods, only resisted for a time. At Southampton the teredo was practically unknown, but timber was quickly destroyed by the chelura. Wrought iron was less liable to corrosion in salt water than steel. In some cases where a depth of mud overlay a hard stratum, wrought iron might be used advantageously in combination with timber piles by driving down the latter until their heads were just above the surface of the ground, and then capping them with tightly fitting hollow iron cylinders, forced down over the piles and bolted to the super-structure and bracing above low-water level. As a general rule cast iron for foundations was confined to large-diameter cylinders sunk with compressed air. Referring to reinforced concrete in the construction of wharves, the lecturer said that as a material it was on its trial, and there had been too great a tendency to bring forward all the points in its favour, while making light of evidence that would tell in the opposite direction.

* * *

Newcastle-upon-Tyne and District Clerk of Works and Builders' Foremen Association.

A meeting of this association was held on Thursday, Dec. 17, when a paper was read by Mr. George Bennison, of H.M. Office of Works, London. Mr. M. D. Gladders occupied the chair. The lecturer took as his subject "The Influence of Materials upon Architecture." From pre-historic times to the present day, the historical influence of materials upon design was very ably traced by the lecturer, with the aid of upwards of 70 lantern slides. Having stated that architecture was an "Affair of materials, the true and proper use of which moulds the style," the lecturer then went to early Egyptian Architecture, showing the stone columns and buildings as having been derived from an earlier mud and reed type. Assyrian Architecture was then stated to have developed from a mud type to that of sun-burnt bricks, this being the early introduction of bricks; no doubt the smallness of the units and not having stone or timber at hand (in some parts) the builders then introduced the arch, first as oversailing courses. The resemblance of the Grecian establature to that of a wooden construction, was then pointed out, thus giving the theory that early Grecian Stone Architecture probably developed from that of timber constructions. The Romans having unlimited unskilled labour at hand, and wishing to use this to the best advantage, they introduced a method of building with waste rubble stone and puddled clay, which gave the earliest forms of concrete structures. The Gothic Age was stated to be a period when builders obtained fine results, not by employing massive and strong materials, but by a delicacy of workmanship. Having described Modern Architecture as an age of upheaval and a period of bad design, greatly owing to the demands of commercialism, the lecturer very strongly condemned our present day street architecture—stating that he thought the present day architects had not given serious attention to the design of ferro-concrete buildings. He said he thought the proper design of same would not be by sticking ornaments upon the surface, or imitating other materials, but by pure lines, good proportion, and sweetness of curves. The lecture was very much enjoyed by a large audience, and a vote of thanks was passed to the lecturer on the motion of Mr. R. Wilson, seconded by Mr. T. Pigg. Mr. Bennison briefly responded.

Bankruptcies

GANN, HUGH MORTIMER, builder and lead merchant, West Mersea. First meeting, Cups Hotel, Colchester, Jan. 22, at 2. P.E. Colchester C.C., same day, at 11.30.

HARDY, LEVI, joiner and builder, Nottingham Road, Kegworth. First meeting O.R.'s, Leicester, Jan. 13, at 12. P.E., The Castle, Leicester, Jan. 15, at 10. R.O., Dec. 30. Adj. same day.

PERKINS, W. T., builder, 62, Church Path, South Acton. Adj. Dec. 17. (Amended notice.)

RICHARDSON, G. R., surveyor, Dawunkuttie, Adelaide Road, Surbiton, and 10, Bolton Gardens, Teddington. Adj. Dec. 22.

TRITT, THOMAS, builder, 36, Crescent Road, Wood Green. P.E. Edmonton C.C., Feb. 1, at 11.30.

Coming Events.

Wednesday, January 13, and Thursday, Jan. 14.

SURVEYORS' INSTITUTION.—Students' Preliminary Examination.

Wednesday, January 13.

NORTHERN ARCHITECTURAL ASSOCIATION.—Meeting of Council, 7 p.m.: Mr. W. H. Knowles, F.S.A., F.R.I.B.A., on "The Romano-British City of Corstopitum, Corbridge."

NORTHERN POLYTECHNIC ARCHITECTURAL AND BUILDING STUDENTS' ASSOCIATION.—President's At Home and Members' Reunion.

Thursday, January 14.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—General Meeting.

SOCIETY OF ARCHITECTS.—Prof. Henry Adams, on "The Stability of Walls." 8 p.m.

Friday, January 15.

INSTITUTION OF MECHANICAL ENGINEERS.—General meeting. 8 p.m.

Saturday, January 16.

ARCHITECTURAL ASSOCIATION.—First spring visit, to Messrs. Selfridge's new premises in Oxford Street. Members to meet at the building at 3 p.m.

Monday, January 18.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. T. Stephen Ayling, F.R.I.B.A., on "Public Abattoirs." Award of Prizes and Studentships, 8 p.m.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. T. Faulkner Shepheard on "Competitions."

UNIVERSITY OF LONDON.—Mr. Banister Fletcher, F.R.I.B.A., on "German Renaissance (and Modern) Architecture." 8 p.m.

Wednesday, January 20.

GLASGOW INSTITUTE OF ARCHITECTS.—Mr. Ramsay Traquair, A.R.I.B.A., on "Mediæval Architecture of Greece."

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. A. Muir, on "Architecture and Social Evolution." 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Meeting. Mr. C. I. Greenhow, on "The Early English Period." 7.30 p.m.

NORTHERN POLYTECHNIC ARCHITECTURAL AND BUILDING STUDENTS' ASSOCIATION.—Discussion on "Apprenticeship," opened by Mr. W. P. Render. 8 p.m.

Friday, January 22.

BIRMINGHAM ARCHITECTURAL ASSOCIATION. — Mr. Arthur S. Dixon, M.A., on "Early Roman Churches."

ROYAL SANITARY INSTITUTE.—Provincial Sessional meeting. Visit to the Manchester Royal Infirmary, 2.30 p.m.; Discussion on "The Manchester Royal Infirmary from the Hygienic, Sanitary and Aesthetic Points of View," to be opened by Mr. Edwin T. Hall, V.P.R.I.B.A., followed by Mr. John Brooke, F.R.I.B.A. 7 p.m.

ARCHITECTURAL ASSOCIATION.—Special general meeting, 7.30 p.m., to consider proposed alterations in the by-laws; also ordinary general meeting, with paper by Mr. J. H. Markham, on "Reinforced Concrete."

Tuesday, January 26, and Wednesday, January 27, 1909.

NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS.—Annual meetings.

Thursday, January 28.

MANCHESTER SOCIETY OF ARCHITECTS.—Mr. Arthur T. Bolton, A.R.I.B.A., on "The Dome as the Basis of an Architectural System." 6.30 p.m.

Monday, February 1.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—President's Address to Students, and Presentation of Prizes.

Friday, February 5.

ARCHITECTURAL ASSOCIATION.—Mr. H. T. Buckland on "Schools." 8 p.m. (Altered from Jan. 22.)

Insurance.

Subscribers to "The Builders' Journal" are entitled to a Free Insurance for £500. Every subscriber should apply for this, sending a postcard with the name of the newsagent with whom the order has been placed. Subscribers can also obtain a General Accident and Sickness Insurance (the "Lighthouse" policy) at a reduced premium, which includes the Annual Subscription to this Journal. A pamphlet giving full particulars can be obtained free on application.

Free £500 Accident Insurance Coupons have this week been sent to the following:

POINTS FROM THE FEDERATION, CENTRE, AND ASSOCIATION REPORTS.

The Council meetings of the Executive Council of the National Federation are to be held on January 26th, in the Balmoral Room of the Trocadero Restaurant, and the annual general meeting will be held at the same place on January 27th. The next National Conference of Secretaries is to be held in Leeds, probably about October 20th. It is mentioned that the question of an adequate supply of apprentices in certain branches of the building trade is becoming urgent, and that the decay of apprenticeship in France has given rise to most of the troubles that beset French building contractors. A further matter that appears to be assuming general importance is the drafting of the fair-wages clause in contracts. The preparation of a model clause, to assist branch associations in dealing with the subject, is being considered by the Federation.

* * *

A large number of copies of corporation fair-wages clauses has been collected by the Secretary of the Lancashire, Cheshire, and North Wales Federation, and it was resolved to send them to the National Federation as material to assist in the formulation of a standard or model clause. Relations with the operatives are becoming unsettled, as many as thirteen local associations having either given or received notice of alteration of working rules .

The question of the direct tendering to architects by electricians has been carefully considered by the Northern Counties Federation, whose representatives have met delegates from the Electrical Contractors' Association, with the result that it has been provisionally agreed that both bodies shall jointly approach the architects with the object of arriving at an equitable arrangement. The Federation has taken action with respect to conditions of tendering (in connection with a drainage scheme), by which it was required that the priced schedule must be returned with the tender, otherwise the deposit paid for the quantities would be retained. A rule of the Federation provides for the priced schedule being forwarded after the lowest tender has been ascertained. The proprietors of the work promised to give due consideration to the views of the Federation.

* * *

Twenty applications for membership were presented at the December meeting of the Sheffield Association, the largest number ever received by this association at one meeting. Sheffield's contribution of £59 odd, it is also recorded, is the largest amount subscribed to the Yorkshire Federation by any association.

* * *

Oldham and District Association have given notice to the joiners of a demand for the reduction of wages from 9½d. per hour to 9d. The notice expires on May 1st. The Association is endeavouring to prevent the adoption by the Corporation of certain arbitrary clauses in contracts, and is fortified in its action with information collected and supplied by the National secretary, as to the clauses in operation in other towns. The Association is also keeping a watchful eye on the proposed Oldham Corporation Improvement Bill, 1909, the draft of which reveals some clauses that are obnoxious to the interests of contractors.

* * *

The value of combination is again seen from an instance reported by the Barnsley Association. A member had been reported by the borough surveyor for committing a breach of the by-laws by erecting a wooden structure without submitting a plan. As the structure in question was merely a builder's cabin or hut, and therefore expressly exempt from the by-law, the builder naturally resented the imputation, and he laid his grievance before his Association. The matter having been discussed by the Association, a deputation was sent to the Improvements Committee of the Town Council, by whom it was assured that the friction had arisen in consequence of a misunderstanding, and that, so far as the Committee was concerned, a builder's hut or cabin could be erected without let or hindrance.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

Meetings.

The January meetings of the Executive Council of the National Federation will be held in the Balmoral Room of the Trocadero Restaurant, on Tuesday, January 26th, the 1908 Council at 10.30 a.m., and the 1909 Council at 2.30 p.m. The annual general meeting will be held at the same place on Wednesday, January 27th, at 10.30 a.m.

Protection of Members.

The case of a sub-contractor member is engaging the attention of the Committee. The materials used for a certain job were selected by the building owner and the architect, were specially named in the quantities and ordered in strict conformity therewith, and were approved on delivery by a resident clerk of works and by the architect. The final certificate was paid some months ago. It turns out that the selected materials are not durable, and now it is sought to make the sub-contractor financially responsible for the defects. Meanwhile the manufacturer has gone into liquidation.

Next Conference of Secretaries.

In response to a cordial invitation from the Yorkshire Federation, it has been decided to hold the 1909 National Conference of Secretaries at Leeds. The date is yet to fix, but it will probably be about October 20th if that is convenient to the Yorkshire Federation. The report of the last Conference is in the press, and will be issued shortly.

Coal Mines (Eight Hours) Bill.

The opposition of the great coal-consuming industries to this Bill has resulted in the day being made 8½ hours instead of 8 hours. The Bill comes into operation for part of the country in July, and for the rest in January, 1910.

Fair Wages Clause in Contracts.

As this question is exciting attention in various districts, a suggestion by the Lancashire, Cheshire, and North Wales Federation is being acted upon, and consideration is being given to the drafting of a model clause to assist our branches when dealing with this question.

Recommendations for Annual Meeting.

Recommendations in regard to the following will appear on the agenda:—

(a) To rescind resolution limiting the sale of contract forms to members only.

(b) To elect and constitute the joint committee under the N.A.O.P. Agreement.

(c) To include in the subscription of individual members of the National the supplying free of the official journal.

(d) That the application of the builders' labourers for admission as parties to the National scheme of conciliation be not granted, but that certain facilities be given for their representation on local boards of conciliation where agreements are in existence between them and the employers, with provision also enabling cases to be referred to the higher boards on certain terms.

Annual Return of Membership.

Reports of this have been sent to the federations, and through them to local associations. It is evident that the question of an adequate supply of apprentices in some of the branches of the building trade is becoming an urgent one. Most of the troubles which beset French building contractors are admitted to arise entirely through the decay of apprenticeship.

Proceedings of Council.

will this year be reported and printed for distribution next morning to representatives attending General Meeting, with a view to assisting them in the discussion of the agenda of the General Meeting.

THE NORTHERN CENTRE OF THE NATIONAL FEDERATION

COMPOSED OF

The Lancashire, Cheshire and North Wales Federation, The Yorkshire Federation and The Northern Counties Federation.

Secretary: JAMES DENVER, Cromwell Buildings, Blackfriars Street, Manchester.

There is nothing to report from the Northern Centre for the past month, no meeting of the Council having been held.

A circular has been issued to all members of the Council informing them that the annual meeting has been fixed to be held in London on Monday evening, January 25th, at 5.30 o'clock.

THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION

Secretary: JOHN TOMLISON, Cromwell Buildings, Blackfriars Street, Manchester.

A meeting of the Finance Sub-Committee of the Lancashire, Cheshire, and North Wales Federation was held on Friday, December 11th, to consider the question of future publication of the official Year Book, and it was decided to recommend to the Administrative Committee "that in future the half-yearly and annual reports be put into book form, with the list of members, copy of rules, and the additional information as printed in the present Year Book, and to issue it free to members in place of the present book and sheet reports, if found practicable on ascertaining the cost.

The president reported that he had had some correspondence with the Lancaster Association, and he understood that they had arranged to carry on their local organisation, and hoped soon to be in a position again to support Federation principles. This report was considered very satisfactory.

The Administrative Committee held their usual monthly meeting on Friday, December 11th.

The secretary reported the result of correspondence which had taken place between himself and several private firms with reference to tenders without quantities.

The accounts for the quarter as presented by the secretary were recommended to the Executive Board for payment.

The half-yearly report, as drafted by the secretary, was adopted for presentation to the Executive Board, with one or two slight alterations.

The secretary reported that he had received a large number of copies of corporation "fair wages" clauses in response to the resolution passed at the last meeting, and after a lengthy discussion it was resolved "that the copies be sent to the National Federation for their consideration, with a view to suggesting a standard clause for adoption."

A case was reported from one of the local associations in which an architect was seeking to impose what were considered to be unjust penalties on one of the members for not having completed a certain contract within the specified time, which the builder had been unable to control. After giving full consideration to the matter, it was decided to refer the case to a small sub-committee.

It was agreed that a Conference of Lancashire, Cheshire and North Wales Federation Secretaries be arranged to be held early in the New Year.

Correspondence was read between the secretary of the National Conciliation Board and the Rochdale secretary with reference to the decision given by the Board as to the notice of discharge to joiners, and the secretary was instructed to communicate with the Rochdale Association thereon.

The quarterly meeting of the Executive Board was held at the Boardroom, Manchester, on Monday, December 21st, when the president presided over a good attendance of members.

The accounts for the quarter, as approved by the Administrative Committee, were passed for payment. It was decided to hold the March meeting of the Board at Blackburn.

The revised rules of the Bury Association were approved on the recommendation of the Administrative Committee.

Some correspondence was read on the subject of daywork charges, and the secretary was instructed to endeavour to arrange a conference between several of the local associations thereon to secure uniformity if possible.

Several other matters of trade interest were discussed, but no formal resolutions were passed.

The half-yearly general meeting was held immediately after lunch on the same day as the Executive Board meeting, at the Victoria Hotel, Manchester, when there was a very good attendance of members from the federated towns, over which the president (Mr. William Bullen) presided.

The half-yearly report presented by the Committee, which dealt at great length with the question of membership and organisation, and the very unsettled relations with the operatives during the past half-year, was taken as read, and adopted for circulation amongst the members. It is striking to note from the report that no less than thirteen of the thirty-two local associations have either given or received notices for alterations to the operatives' working rules.

It was decided to hold the annual general meeting at New Brighton in June.

The representatives on the National and Northern Centre Councils were elected by ballot. Messrs. W. Tinker, Manchester; J. E. Tinline, Bury; and Frank Woods, Bolton, were elected in the place of Mr. Walter Marshall, Manchester, the Liverpool President for the time being, and Mr. H. Warbrick, Lancaster; the remainder were re-elected.

Messrs. J. Storrs, S. Smethurst, and G. Macfarlane were re-elected to represent the Federation on the National Conciliation Board. Messrs. S. Smethurst, G. Macfarlane, Wm. Bullen, and H. Lever were re-elected the representatives on the Northern Centre Board; and Mr. John Cartmell, Preston, was elected to fill the place of Mr. Walter Marshall, who desired to retire.

The proposed rule providing for arbitration between sole and sub-contractors in business disputes was adopted as a rule of the Federation.

The position of the reserve fund was reported on by the secretary, and the president and several members of the committee made earnest appeals to the representatives present for further subscriptions from their associations.

Several other matters of trade interest were discussed, including the arrangements made by the National Federation with the BUILDERS' JOURNAL, but no formal resolutions were passed, and with a vote of thanks passed to the President for his services in the chair the meeting terminated.

LOCAL ASSOCIATIONS AFFILIATED TO THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION.

BURY AND DISTRICT ASSOCIATION.

Secretary: Robert Hall.

The monthly meeting of the Bury and District Association was held on Wednesday evening, December 30th, 1908, the president, Mr. John Inman, in the chair. The secretary presented his report of the half-yearly general meeting of the Lancashire, Cheshire, and North Wales Federation, held in Manchester on Monday, December 21st 1908.

The proposed new Bill of the Bury Corporation was discussed at some length, so far as the building clauses affect the trade, after which it was agreed that the secretary prepare a report upon the various clauses for the next meeting.

A circular letter from the Federation respecting patent slab partitions was discussed, but no

ROBERT HALL,
Building Surveyor,
52, Frederick Street, BURY

With over 35 years practical experience of the Building Trade, and during the last 15 years a very varied experience in measuring up and adjusting contract and other accounts, is prepared to undertake and submit quotations for the following:—

The Measuring-up and Adjustment of Accounts,
Collection and Settlement of Accounts,
Assistance given in Estimating,
Annual or other Periodical Stocktakings,
Private Enquiries and Arbitrations undertaken,
or any other special work incidental to that a Builder or Contractor.

Fire, Burglary and Motor Car Insurance.

decision was arrived at, owing to the want of a definition. A letter was read from the Operative Carpenters' and Joiners' Society respecting the question of the demarcation of work. The matter was left in the hands of the secretary.

LLANDUDNO AND DISTRICT ASSOCIATION.

Secretary: E. P. Morris, Accountant.

The fifth annual general meeting of the Llandudno Association was held at the secretary's offices, on Thursday, December 10th, the president in the chair.

The fifth annual report was read and adopted. In the report it was stated that the relations with the operatives had been satisfactory during the past year, no question having arisen for discussion. During the past year the District Council have been making arrangements for the rebuilding of the public library, and a suggestion that local stone and Welsh slate should be used was favourably received by the Council and the architect. The committee were asked by the District Council whether they were prepared to quote for the work without quantities, and after full discussion it was decided that it would be fairer to both parties if quantities were prepared, and this conclusion was accepted by the Council. It was further mentioned in the report that during the past year the BUILDERS' JOURNAL has been adopted as the official organ of the National Federation, and that full reports of association matters regularly appear in its pages. The committee again draw attention to the importance of insisting on the use of the R.I.B.A. contract form on contracts exceeding £500, copies of which can be had from the secretary at the price of 1s. each. The committee also urge the desirability of inducing builders' merchants and others to join the association, and of giving preference, as far as possible, to such honorary members when ordering goods.

Officers were elected as follows:—President, J. O. Thomas, J.P.; vice-presidents, John Roberts and Henry Hughes; hon. treasurer, Geo. Roberts; committee, Councillor Hugh Edwards, Messrs. H. W. Lance, Ed. Owen, R. T. Owen, and Luther Roberts.

The committee was asked to consider the question of uniform starting time.

A vote of thanks to the past president and to the secretary closed the meeting.

MANCHESTER, SALFORD AND DISTRICT ASSOCIATION.

Secretary: John Tomlison.

The monthly meeting of the General Committee of this association was held at the Boardroom Blackfriars Street, Manchester, on Thursday, December 10th, when the president, Mr. G. Macfarlane, presided over a good attendance of members.

The reorganisation of the association was the chief question under consideration, and several members reported results of interviews they had had with members who had not yet qualified under the scheme, from which it is expected that several more employers will affiliate themselves with the reorganised society.

It was decided to pay a further sum of £50 to the Lancashire, Cheshire, and North Wales Federation Reserve Fund; and the annual subscription to the same federation was also passed for payment.

The proposed amendments of the Northern Centre Executive to the Conciliation Board rules were approved with one exception, which will be brought before the National Board when the same are considered.

Two new members were elected to the association.

A vote of thanks was passed to the Joiners' Trade Committee for the manner in which they had dealt with the operative joiners' demand for an increase in wages.

OLDHAM AND DISTRICT ASSOCIATION.

Secretaries: Cowper and Dean, Accountants.

The number of members to date is 180.

The sub-committee of the Oldham and District Association appointed to deal with the fair contracts' clause will shortly meet again to discuss this matter further, and to elect representatives to appear before the Finance Committee of the Oldham Corporation. Every effort will be made to prevent the adoption by the Corporation of the proposed new clauses in contracts, and information regarding the clauses in operation in a large number of other towns has been kindly supplied by Mr. A. G. White, the National secretary.

The draft of the proposed Oldham Corporation Improvement Bill, 1909, is now in the hands of the secretaries, and will be discussed at the same meeting, as it contains some arbitrary clauses in regard to building regulations.

The Joiners' Trade Committee have had under consideration the reduction of wages in view of the present state of trade, and due notice has been given to the operatives' society for reduction from 9½d. per hour to 9d. The notice expires on May 1st, 1909.

An interesting point affecting the employers who may have work in Failsworth is that a greater portion of this district comes under the Oldham working rules, and not under Manchester rules, which is an advantage to employers working in the district. This point has been settled by the Northern Centre Conciliation Board.

The Executive and Trade Committees have had many matters before them, and more than 20 local meetings have been held during the year, in addition to attendances at Federation and Conciliation Board meetings.

The annual general meeting will be held at the end of January, when a full report of the year's work will be presented to the members.

ROSSENDALE AND DISTRICT ASSOCIATION.

Secreary: Robert Hall.

At the annual general meeting of the Rossendale and District Association, held at the Queen's Arms Hotel, Rawtenstall, Mr. B. Constantine (of Messrs. Constantine and Lindsay) was elected president for the ensuing year, Mr. O. Ashworth senior vice-president, Mr. J. H. Hayle junior vice-president, Mr. W. T. Watson treasurer, and Mr. R. Hall secretary. A committee of nine members was also elected. The annual dinner was fixed for Wednesday, January 20th, at the Queen's Arms Hotel, Rawtenstall, at 6 p.m. The following guests were invited:—Mr. W. Bullen, president of the L.C. and N. Wales Federation; Mr. George Macfarlane, past president National Federation, and the surveyors of the three boroughs of Bacup, Haslingden, and Rawtenstall.

A question affecting one of the members, which had been placed before the Federation, was reported upon by the secretary, and approved.

WIGAN AND DISTRICT ASSOCIATION.

Secretary: R. Hollows, A.C.A., etc.

Meetings with the deputation from Operative Joiners' Society, respecting the notice for alteration to the present working rules, will be held early this month.

There is nothing to report of interest to the trade, except an excerpt from the report in the local Press respecting the work performed by the Coroporation, which was brought before their notice at the annual meeting. The matter was introduced to the meeting by Mr. James Howard, who submitted the toast, "The Town and Trade of Wigan," and said the rates had in the last decade practically doubled, and he failed to see what they in Wigan had to show for that double amount of rate. He noticed an observation at the last council meeting that the painting had cost three times as much as a contractor would do the work for. He did not see why their representatives should ever agree to paying three times as much as was necessary to have a good job. He did not think they were benefiting the ratepayers, but simply wasting the ratepayers' money by such a thing. If the work was in contractors' hands, they would have had an equally good job at one-third of the cost. There were direct proofs given in the little book, "Municipal Works Departments," that work done under the municipal works committee or department invariably cost a lot more than when done by a private contractor. When a private contractor had done work for a corporation, he had a specification to work to, and (he said this with all due respect to the officials who were placed over such work) the employer who had passed his life in the work was a better judge of what a really good job was. Their Town Council had been unfortunate in their undertakings. Some years ago they built a lot of cottages on the Vauxhall area, entering as speculative builders. They afterwards sold them at a loss of £60 a house. He did not see why the Corporation had any right to deal with the ratepayers' money in that way. Furthermore, the Corporation had made themselves into layers of tram-lines. He thought he was perfectly correct in saying that the lines laid by the Corporation cost twice as much as those laid by the contractor, and they were not one jot better. The Corporation built a tram shed down at Seven Stars Bridge, and from his observations he believed that any builder in Wigan would have been glad to provide labour and material for the brickwork of that tram shed at the price it cost the Corporation for the labour alone. He hoped their representatives would take these things to heart, and consider the interests of the ratepayers; because in letting their work out to contractors they were still providing work for workmen. As a proof of bad trade, he would mention, and they would be sorry to hear it, that during the past twelve months the association had lost more than twenty-five members. Those members had not left through any fault of their own. Trade had been bad. Taken upon the whole, they had been steady, hard-working, intelligent, industrious men, but the bad times had compelled them to resign their membership. He trusted that before long there would be an opportunity for them to rejoin, and he wished them every prosperity. The toast was drunk with enthusiam-and with it the names of the Mayor and Councillor Mather were coupled. Councillor Mather, in response, said he was very much impressed with the remarks of Mr. Howard, and he agreed with him. He was sorry his committee had been culprits in the matter, but it was against his own view, and he would vote for any work of the Corporation being put out to contract.

The Mayor said that he was very much struck with Mr. Howard's remarks.

There is nothing to report from the following associations affiliated to the Lancashire, Cheshire, and North Wales Federation: Altrincham, Ashton-under-Lyne, Barrow-in-Furness, Birkenhead and Wirrall, Blackpool, Bolton and Farnworth, Burnley, Chester, Crewe, Darwen, Heywood, Lancaster, Leigh, Liverpool, Longridge, Macclesfield, Middleton, Radcliffe, Rochdale, Southport, St. Annes-on-Sea, St. Helens, Stockport, Wallasey, Warrington. The report from Preston is held over.

THE YORKSHIRE FEDERATION

Secretary; J. DAVIDSON, 14, Park Row, Leeds.

LOCAL ASSOCIATIONS AFFILIATED TO THE YORKSHIRE FEDERATION.

BARNSLEY ASSOCIATION.

Secretary: J. Denton.

The number of members to date is 50.

The annual meeting of the Barnsley Association was held at the King's Head Hotel, Barnsley, on December 9th, 1908, Councillor G. Haigh, the newly re-elected president, occupying the chair. Twenty members were present. The minutes of the previous meeting having been confirmed, and the report of the last Yorkshire meeting submitted by the delegates, and approved, the president and secretary were appointed a deputation to wait on the town clerk to obtain a copy of the fair wages clause, at the request of Mr. Tomlison, secretary to the Northern Centre. An animated discussion took place with respect to the admittance of builders' labourers to the local Conciliation Board, the question of admittance being ultimately left in abeyance for the present.

A long and animated discussion took place on a complaint brought before the meeting by Mr. P. Dalby, a local builder and a member of the Federation, with respect to "alleged unjust treatment at the hands of the borough surveyor and the Street and Improvements Committee of the town council." The cause of complaint was as follows. Mr. Dalby, having practically completed the erection of a number of cottages, had negotiated for a plot of land on which to store for a little while his builder's cabin or hut. The borough surveyor reported to the Streets and Improvements Committee that Mr. Dalby was committing a breach of the local by-law which provides that no wooden or other erection shall be erected unless a plan of same has been submitted and approved by the above committee. A builder's cabin, however, is exempt from the above by-law, and Mr. Dalby justly and naturally resented the allegation that he had broken any by-law, and also the above committee's decision that he must remove the cabin or submit to the usual penalties. A report of the case appeared in the local Press. The meeting sympathised with Mr. Dalby, and the president, vice-president, and secretary were appointed a deputation to interview the Streets and Improvements Committee with a view to obtaining redress.

The secretary submitted his report of the past year's workings, and a hearty vote of thanks was accorded to him.

It was decided to hold an annual dinner jointly with the local Master Builders' Association.

The treasurer (Mr. H. Ashworth) submitted his sixth annual report, which was verified as correct by the auditors, and unanimously approved by the members, the treasurer receiving a hearty vote of thanks for his past services.

The election of the committee for the forthcoming year resulted as follows:—Masons, Messrs. Dalby, Higham, C. W. Squire, Walker, C. K. Taylor, and Councillor G. Millor; joiners, Messrs. Goodyear, J. Smith, Councillor W. G. England, J.P., and H. Pashley; plumbers, Messrs. Drawfield and J. A. Binns; painters, Mr. G. Fleetwood; plasterers, Messrs. T. Lindley and Wilcock; slaters, Mr. J. Denton (Messrs. Dawber, Townsley and Co., Ltd.).

Since the above meeting, the Streets and Improvements Committee of the Town Council received, at their usual monthly meeting, the deputation referred to. After the complaint had been heard, the deputation was assured that a builder could erect a cabin without let or hindrance on any site where he might be building, and that Mr. Dalby's case had arisen from a pure misunderstanding, owing to the largeness of the cabin, and nothing further would be heard of the matter. This assurance being very satisfactory, the deputation returned thanks and withdrew.

SHEFFIELD ASSOCIATION.

Secretary: Thos. Smith.

The monthly meeting of the Sheffield Association was held on December 8th, the president (Mr. Thos. Eshelby) presiding.

Letters were read from the Amalgamated Society of Carpenters and Joiners and the Manchester Order of Bricklayers, complaining that, in the former case, a member of the association was employing joiners for full summer time without paying overtime; while in the latter, the complaint was that walking time was not being allowed on a job. In the case of the joiners, it was pointed out that the overtime alleged was only temporary, the men being allowed to recover a little on the very short time they worked in September. The employers, however, were quite willing to comply with the strict letter of the rules, on the matter being brought to their notice. The case of walking time was more important as it once again raised the question of working contrary to an established custom of the trade, which stipulated that men engaged and paid on the job were not entitled to claim walking time. On this matter there was diversity of practice at the present time, and it was felt that the whole matter needed thorough discussion in order to save further bickering. To settle the matter temporarily, the employers concerned were willing to pay so far as the particular job in question had gone, but it was considered necessary to appoint a committee to consider the question.

The question of the payment of walking time to men engaged and paid on the job came up again as a separate item on the agenda, and led to a long and important discussion. It was shown by Mr. Boot that the present contention was that a firm established near a job outside the boundary—at least, when working on a Corporation job—was expected to pay walking time just the same as if the firm had its works in the centre of the town, and the irony of the thing was that the Corporation itself did not observe these conditions which it sought to impose on other contractors, while the conditions at the same time were contrary to established local practice. Mr. Boot thought that an office fixed on a job lasting over six months constituted in effect a separate branch of the firm. There was some diversity of opinion in regard to this, but there was absolute agreement on the fact that the way in which the question of walking time was being pushed forward constituted a serious menace to the local building trade, and it was unanimously agreed that a committee be appointed to consider the whole question and report to next meeting. A further resolution was also unanimously passed appointing the members of the Conciliation Board as the committee to consider the matter

YORK ASSOCIATION.

Secretary: J. Hague.

An executive meeting of the York Association was held on Friday, December 4th, when Mr. Sharp presided over a well-attended meeting. The reports of the various committees on the schedule of prices were submitted and approved, the draft schedule as approved being referred to the annual meeting for adoption. The proposed agenda for the annual meeting was fully discussed, and finally approved in accordance with the recommendations made.

The annual meeting was held at the Old George Hotel, Pavement, on Friday, December 11th. Mr. G. Sharp presided over one of the best-attended meetings ever held by the association. The minutes having been duly read and confirmed, the secretary read a report on the work during the past year, which was approved.

The following officers were elected:—President, the Right Hon. The Lord Mayor of York (Mr. Alderman J. Birch); vice-president, Mr. W. E. Biscomb (re-elected); treasurer, Mr. C. Dent (re-elected); secretary, Mr. J. Hague (re-elected). The executive was re-elected, with the exception that Mr. G. Sharp, th retiring president, succeeds Mr. Borwell. The trades' committee were re-elected. Representatives on Yorkshire Federation, the Right Hon. The Lord Mayor, Mr. W. E. Biscomb, and Mr. C. Dent; representatives at National meeting, Mr. G. Sharp, Mr. W. E. Biscomb, Mr. C. Dent, Mr. Councillor Hardgrave; auditors, Coun. J. Hardgrave and F. W. Birch.

There is nothing to report from the following associations affiliated to the Yorkshire Federation: Barnoldswick, Bridlington, Dewsbury, Grimsby, Halifax, Harrogate, Huddersfield, Hull, Malton, Morley, Scarborough, Wakefield. Reports from the Yorkshire Federation, and from the associations at Bradford, Leeds and Shipley are held over.

THE NORTHERN COUNTIES FEDERATION.

Secretary: W. H. HOPE, Solicitor, Post Office Chambers, 14, Norfolk Street, Sunderland.

The annual general meeting of the Northern Counties Federation was held at the Hotel Metropole, Newcastle-on-Tyne, on Thursday, December 17th, 1908, at four o'clock p.m., Councillor Stephen Easten, of Newcastle-on-Tyne, president, in the chair. There were also present Messrs. R. Heslop, Wm. Foster, J. C. Hope, and W. T. Weir (Newcastle), A. Ross, J. T. Armstrong, J. Shewan, W. J. Robertson, and J. G. Robertson (South Shields), J. T. Scott, J. Pelton, and J. R. Hadaway (North Shields), R. J. Huntley, W. B. Cooper, F. W. Ranken, J. M. Wright, and J. McMillan (Sunderland), T. Wilkinson, W. S. Davison, G. Hudson, W. Masters, P. Bray, and H. McNaughton (Middlesbrough), T. Brown, R. Johnson, J. Davison, F. W .Taylor, G. E. Grey, and L. Brown (Stockton-on-Tees), E. M. Tweddle, W. M. Thompson, J. Moore, and J. B. Wilson (West Hartlepool), H. L. Gradon (Durham), F. Oates (Chester-le-Street).

In the absence of the honorary treasurer (Mr. J. W. White, Sunderland), the audited balance sheet for the past year was submitted by Mr. F. W. Ranken (Sunderland), who proposed its adoption. This was seconded by Mr. R. J. Huntley, and carried unanimously.

The estimated income and expenditure for the ensuing year was considered, and, on the proposition of Mr. J. Davison, seconded by Mr. A. Ross, it was resolved: "That the annual subscriptions from the local associations to the Federation remain the same as last year, namely 1/3 per £100 of wages paid."

The secretary presented his annual report of the work of the Federation, which was adopted after Mr. Hope had been thanked.

On the proposition of Mr. Easten, seconded by Mr. W. J. Robertson (South Shields), Mr. J. Davison, of Stockton, was unanimously elected president. Mr. Davison thanked the members very heartily for his election, and said he had great pleasure in accepting the honour, and moved that a vote of thanks of the Federation be given to Mr. S. Easten for his services during his term of office. This was carried with acclamation.

On the proposition of Mr. J. T. Armstrong, seconded by Mr. J. Pelton, Mr. Alex. Ross, of South Shields, was unanimously elected senior vice-president. On the proposition of Mr. R. J. Huntley, seconded by Mr. J. McMillan, and supported by Mr. J. T. Armstrong, Mr. F. W. Ranken, of Sunderland, was elected junior vice-president. On the proposition of Mr. W. T. Weir, seconded by Mr. T. Wilkinson, Mr. J. W. White (Sunderland), was unanimously re-elected honorary treasurer, and Messrs. P. Bray (Middlesbrough), and J. C. Hope (Newcastle) were unanimously elected honorary auditors. The following were elected upon the executive council: Messrs. J. Davidson, A. Ross, F. W. Ranken, S. Easten, W. T. Weir, W. Foster, W. J. Robertson J. Pelton, J. Simpson, R. J. Huntley, W. B. Cooper, J. W. White, W. Masters, R. Johnson, and J. Proud. The following were elected on the National Council and the Northern Centre: Messrs. S. Easten (Newcastle), T. Wilkinson (Middlesbrough), J. Proud (West Hartlepool), (Mr. J. W. White, Sunderland, as honorary treasurer of the National Federation *ex-officio*). The National and Northern Centre Conciliation Boards:—Messrs. T. Wilkinson and J. W. White.

On the proposition of Mr. R. J. Huntley, seconded by Mr. J. T. Armstrong, Messrs. A. Ross and W. H. Hope (Federation secretary) were appointed the representatives of this Federation at the annual general meeting of the National Federation to be held in London on Wednesday, January 27th, 1909.

Mr. S. Easten gave a report upon the interview with the Education Building Sub-Committee of the Durham County Council, and the representatives of this Federation, when the question of the conditions of contracting was discussed. The result was that the Building Committee promised to give favourable consideration to the representations of the deputation.

Mr. Easten gave a report upon the meeting between the representatives of the electrical contractors and the representatives of this Federation to consider the question of direct tendering to architects, by electricians, with a view to securing proper consideration for the contractor. The decision arrived at was subject to confirmation by the Central Board of the Electrical Contractors' Association, and was to the effect:—"That this Federation and the Electrical Contractors' Association should approach the architects and lay the full facts before them—that the present direct tendering is giving dissatisfaction and causing friction in carrying out contracts—with a view to a satisfactory understanding being arrived at as to the respective interests of the parties concerned."

Correspondence showed that this Federation had under consideration the question of fair wages clauses in the conditions of contract of corporations, rural and urban district councils and other public bodies. Information is being obtained from different quarters.

The Federation's attention was drawn to a set of quantities issued for a drainage scheme in the Newcastle District. One of the conditions was that unless the priced schedule was returned with the tender the deposit paid for the quantities would be retained. This is in direct conflict with the rule of this Federation, which provides for the priced schedule being forwarded when the tenders have been considered and the lowest ascertained. Correspondence was entered into with the proprietors of the work, before whom the objections of this Federation were laid, and who have promised to give due consideration to the views of the Federation.

A communication from the South Shields Association with reference to the question of subscription to be paid by firms embraced in the district was referred to the Executive Council for consideration.

The Sunderland Association reported that they had given notice of alteration to the bricklayers' and joiners working rules affecting winter working hours.

The Teesside Association reported that they had under consideration the question of the position of the sub-contractors, and were considering the draft form of sub-contract.

On the proposition of Mr. H. McNaughton, seconded by Mr. J. B. Wilson, it was decided to hold the next quarterly meeting at Middlesbrough, the date and time to be left in the hands of the president and secretary.

Mr. Easten then invited the representatives present from the Teesside and Sunderland Associations to be the guests of the Tyne and Blyth District Federation at their annual dinner, which was to be held immediately afterwards at the Royal Exchange, Grey Street, Newcastle-on-Tyne. Amidst applause, the hospitable invitation was accepted.

LOCAL ASSOCIATIONS AFFILIATED TO THE NORTHERN COUNTIES FEDERATION.

NEWCASTLE AND TYNE DISTRICT ASSOC.

Secretary: Wilton A. Rycroft, Accountant.

The trade in the Newcastle and Tyne district is very slack, and prospects for the year upon which we have just entered do not appear by any means good. One or two large contracts are to be carried out, the plans for which are still in the architect's hands, but there are not many of these, whilst speculative building is declining day by day.

The annual dinner of the Tyne and Blyth District Federation mentioned in my last report was duly held at the Royal Exchange, Grey Street, Newcastle-on-Tyne, when some 140 sat down.

This association has recently met a deputation from the operative carpenters and joiners' society in this district to consider the question of work which the members of that society claim should be done by themselves, but which in many cases is given to cabinet-makers. After considerable discussion it was agreed to take joint action in the matter, as it was felt that a great deal of the work referred to could be fully as well done by the members of the joiners' society as by cabinet-makers, whilst many of the builders had the plant and machinery necessary in the carrying out of such work. The joiners' contention that they were entitled to this class of work was also upheld.

At present we are busy preparatory to publishing a directory card of all members connected with the Association, as builders, merchants, or sub-traders, together with other information useful to the trade, which we trust will not only result in extending the operation of the inter-trading rule, but also in increasing to a large extent our membership.

NORTH SHIELDS, WHITLEY AND DISTRICT.

Secretary: John R. Hadaway, C.A.

The annual meeting of the North Shields, Whitley, and District Association was held on December 10, 1908, at 77, Howard Street, North Shields.

Mr. Joseph Pelton presided over a fair attendance of members. Mr. John R. Hadaway, C.A. (secretary) presented the annual report and statement of accounts, which were unanimously adopted.

The president congratulated the members upon the satisfactory state of the association's finances. He was also glad to say that the relations between the building trade employers and employees continued to be of a pacific character, and remarked that in spite of the prevailing slackness in trade no reduction had been made in the wages of the operatives. There had been clouds on the building trade horizon during the past year, but the only remaining one was lack of employment. Contracts were very few and far between, and competition was, in consequence, exceedingly keen.

A vote of thanks having been passed to the retiring officers, the election of officers for the ensuing year was then proceeded with, and resulted as follows:—President, Mr. Joseph Pelton (re-elected); vice-presidents, Messrs. J. T. Scott and W. S. Shepherd; representatives to the Northern Counties Federation, Messrs. Joseph Pelton, J. T. Scott, and J. F. Newbold; representatives to the Tyne and Blyth Federation, Messrs. W. S. Shepherd and J. G. Fell; auditor, Mr. George A. Leck.

The secretary reported that arrangements had been practically completed for the holding of the Tyne and Blyth Federation annual dinner, at the Royal Exchange, Newcastle, on January 17th, and that the mayors of the different towns and presidents of the National Federation, and of the Northern Architectural Association, had been invited.

A vote of thanks to Mr. Pelton for presiding brought the meeting to a close.

There is nothing to report from the following local associations affiliated to the Northern Counties Federation: Gateshead, Hartlepools, Middlesbrough, South Shields, Stockton-on-Tees, Sunderland, Teesside.

TYNE AND BLYTH DISTRICT BUILDING TRADES FEDERATION.

Secretary: W. H. Hope, Solicitor, Post Office Chambers, 14, Norfolk Street, Sunderland.

The Tyne and Blyth District Building Trades Federation held their annual dinner at the Royal Exchange, Grey Street, Newcastle-on-Tyne, on Thursday evening, December 17th, 1908. The president, Councillor Stephen Easten, was in the chair, and was supported by the Lord Mayor of Newcastle (Ald. J. J. Forster), the Sheriff of Newcastle (Councillor T. Rowe), the Mayor of Tynemouth (Councillor W. Hardie), Mr. J. Davidson (president of the Northern Counties Federation of Building Trades Employers), Mr. George T. Brown (president of the Northern Architectural Association), Mr. A. G. White (secretary of the National Federation of Building Trade Employers), etc., etc.

Mr. W. T. Weir proposed "The National Federation of Building Trade Employers." Mr. John W. White (honorary treasurer of that body) in response said that the creation of a National Conciliation Board had been one of the most successful things attempted by any trade in the country. Perhaps the President of the Board of Trade might take a lesson from the methods they had adopted in connection with the efforts he was making to bring about a cessation of strikes throughout the country. If the National Federation had done nothing else for the country, they had done a great deal in accomplishing that object.

Mr. A. G. White (secretary of the National Federation) also responded. He said that the Board of Trade statistics showed that they had turned the corner in the depression in the building trade. The workmen, he contended, had nothing to complain of in regard to the wages paid in the trade.

Mr. J. Davidson, president of the Northern Counties Federation, proposed "The Tyne and Blyth District Building Trades Federation." He claimed that the Federation had done a great deal for the masters, the workmen, and the architects. The builders had got conditions which they would not have obtained but for the National Federation, architects, he believed, would rather deal with men connected with the Federation than outsiders, so would the operatives.

The President (Councillor Easten) said that what the Federation aimed to do was to secure contracts that were fair and equitable to all parties concerned. They simply asked as builders for justice and no favour, to have the existing conditions so altered as to give them a fair right to ask for what was their own. At the present time they were unfortunately in the position of having on many occasions to take as a favour or as an act of grace what was their honest due. That was not a position they could suffer any longer. All they asked were conditions such as any business man would require as between man and man. At the present time they had conditions of contract that architects, solicitors, and town clerks considered only fools would sign. Their object was to remedy this, always considering the right of those they were working for. In his opinion, there was no more ridiculous position than that of employer or municipal body employing an architect who was their servant and employing that architect to be the sole arbitrator in the event not only of disputes between the employer and the contractor, but in cases of dispute between the architect and contractor.

Mr. W. Foster, president of the Newcastle Association, Mr. J. Simpson, president of the Blyth Association, Councillor J. T. Armstrong, president of the South Shields Association; and Mr. Joseph Pelton, president of the North Shields Association, also replied.

Mr. D. N. Brims gave the toast of "Our Municipal Authorities," and the Lord Mayor of Newcastle responded.

Mr. A. Ross gave "The Architects, Engineers, and Surveyors." Mr. Geo. T. Brown, F.R.I.B.A., President of the Northern Architectural Association, in responding, said that he also spoke on behalf of the surveyors and architects. With regard to the forms of contract used by public bodies, which the Federation was endeavouring to have superseded by the joint articles of agreement and general conditions of the Royal Institute of British Architects and the Builders' Institute, the principal difference between the two Forms of Contract, he said, was the arbitration clause. Under the old forms of contract the architect was sole arbitrator, and as such occupied a somewhat judicial position between the proprietor and builder, a position he thought he might say was somewhat difficult to fill, inasmuch as he—the architect—was paid by one of the two parties between whom he had to act, and he thought it said a good deal for the honour of his profession that this condition of things existed satisfactorily for so long, with rarely an exception. It was, however, the occasional exception which had rendered it necessary that builders should not be at the absolute mercy of the architect, and so the arbitration clause was introduced.

THE MIDLAND CENTRE OF THE NATIONAL FEDERATION.

Secretary: F. W. Amphlet, 58, New Street, Birmingham.

A meeting of the Midland Centre Conciliation Board was held at the Imperial Hotel, Birmingham, on Thursday, December 3rd last. Mr. John B. Whitehouse (Birmingham) presided, and most of the members of the Board, or their substitutes, were present. The meeting had been specially called to consider a dispute (mentioned in our last Federation reports) which the Birmingham Conciliation Board had been unable to settle. The question at issue was as to the rate of payment to a night gang of bricklayers employed by a Liverpool firm on the alterations to Messrs. Lewis's premises, Bull Street, Birmingham. The operatives contended that, in accordance with the working rules, overtime started after 6 p.m.. and should be paid for at the rate of time and a half. They also claimed that it was customary in Birmingham to pay night-gangs at the over time rate. The employers, in a letter read to the meeting, stated that they had explained to all the men, previous to engaging them, the conditions of work, namely, that they were to work the same number of hours during the night as the other men worked in the day, and were to receive the same rate of pay. After some discussion, the Board resolved *nem. con.* that the night gangs were working overtime in accordance with the Birmingham working rules, and were therefore entitled to payment at the rate of time and a half. The case was one that proved conclusively how impossible it is to frame working rules which (however carefully drawn up) will cover every possible contingency. There is nothing in the Birmingham working rules dealing specifically with the matter of night gangs, and this is the first time the question has arisen as to the rate of payment of such gangs.—Fred. W. Amphlet.

LOCAL ASSOCIATIONS AFFILIATED TO THE MIDLAND CENTRE.

BROMSGROVE AND DISTRICT ASSOCIATION.

Secretary: Sydney J. Brazier.

A meeting of the Bromsgrove and District Association was held on Saturday evening, December 12, 1908, Mr. W. Weaver presiding, with Mr. D. Edwards in the vice-chair. There was a good attendance of members.

It was decided to proceed with the formation of a local Conciliation Board, as the replies from the bricklayers', carpenters', and stonemasons' societies were all in favour of such a Board. Six members from this association were elected. The first meeting will probably take place on January 16th.

It was unanimously resolved to subscribe to the Builders' Journal.

BURTON-ON-TRENT AND DISTRICT ASSOCIATION.

Secretary: A. W. Chamberlain.

The quarterly general meeting of the Burton-on-Trent and District Building Trade Employers Association was held at the Station Hotel, Burton-on-Trent, on Tuesday, December 1, 1908, Alderman T. E. Lowe, J.P., in the chair.

Arising from the minutes the chairman stated that the operatives in Burton had expressed their satisfaction at the manner in which the masters' association has treated them in respect to their wages during the long and acute depression in trade.

The local branch of the Associated Ironmongers had written to the association pointing out the loss which master builders incurred by allowing tool hawkers from out-of-town firms visiting their workshops during working hours, and asking if the same indulgence could be allowed to local tool dealers. After considerable discussion, it was eventually decided that at builders' shops where the outside dealers are allowed to trade the same facilities shall in the future be accorded to the local traders.

The secretary read correspondence received from the Labour Co-partnership Association of London. It was resolved that the secretary communicate with this association and ask for details of the scheme relative to the building trade, and report to the next meeting.

It was resolved that the annual meeting and dinner be held on Saturday, January 30th.

It was resolved that this Association will do all in its power to promote the success of the Builders' Journal, and the secretary was instructed to canvas all the members with this object.

The secretary read his report of the proceedings of the Conference of National Secretaries, held in London in October last. After a discussion on the paper read to the conference by Mr. W. H. Hope, of Sunderland, on forms of contract, a vote of thanks was unanimously accorded Mr. Chamberlain for his report.

Mr. T. W. Selby gave a brief report of the proceedings of a meeting of the Midland Centre Conciliation Board he had attended in Birmingham, relating to the dispute at Leicester, on the question of walking time.

By the death of Mr. John Maddocks, which occurred on December 16th, the Burton-on-Trent Building Trade Employers' Association lost its oldest member. Mr. Maddocks, who was in his 78th year, had held the office of treasurer to the association. The funeral took place at Burton Cemetery on Saturday, December 19th, and was attended by several representatives of the Burton Master Builders' Association.

There is nothing to report from the following local associations affiliated to the Midland Centre: Birmingham, Coventry, Derby, Dudley, King's Norton, Leamington, Leicester, Long Eaton, Loughborough, Mansfield, Newark, Northampton, North Staffordshire, Nottingham, Nuneaton, Redditch, Stafford, Stourbridge, Walsall, West Bromwich, Wolverhampton, Worcester.

THE SOUTH-EASTERN CENTRE OF THE NATIONAL FEDERATION.

COMPOSED OF

The London Federation, The Southern Counties Federation, and The Eastern Counties Federation.

Secretary : T. COSTIGAN, 31 & 32, Bedford Street, Strand, London, W.C.

THE LONDON FEDERATION.

Secretary : T. COSTIGAN, 31 & 32, Bedford Street, Strand, London, W.C.

The following meetings of the London Master Builders' Association have been held since the last report: Office Premises Committee; Finance Committee, and Council—all on December 17th.

The Council received and adopted the reports of the Office Premises and Finance Committees.

Correspondence re the Colchester Asylum was considered.

A report of the Westminster Police Court proceedings re the workmen's overtime was ordered to be placed on the minutes.

Instructions were given with respect to the annual audit and the Association annual dinner.

THE SOUTHERN COUNTIES FEDERATION.

Secretary : T. COSTIGAN, 31 and 32, Bedford Street, Strand, London, W.C.

LOCAL ASSOCIATIONS AFFILIATED TO THE SOUTHERN COUNTIES FEDERATION.

SOUTHAMPTON AND DISTRICT ASSOCIATION.

Hon. Secretary: A. T. Doggrell.

At the meeting held at the Royal Hotel, Southampton, on Wednesday, December 30, 1908, the attendance owing to the Arctic weather was smaller than usual, but some important business was transacted.

Several important alterations in working rules, including a reduction of wages and alteration of working hours, were discussed and agreed to, the new rules to come into force on May 1st, 1909, and due notices were sent to the men's representatives. The date of the annual general meeting was fixed for January 30th, when several important matters are expected to come up for discussion.

There is nothing to report from the South-Eastern Centre, nor from the Southern Counties Federation, nor from the following local associations affiliated to the Southern Counties Federation: Brighton, Chatham, Gravesend, Maidstone, Portsmouth.

THE EASTERN COUNTIES FEDERATION.

LOCAL ASSOCIATIONS AFFILIATED TO THE EASTERN COUNTIES FEDERATION.

GREAT YARMOUTH ASSOCIATION.

Secretary: R. J. Hill.

A committee meeting of the Great Yarmouth Association was held on November 24th, 1908, to consider the advisability of amending the rules, but was so sparsely attended that it was thought advisable to postpone the discussion.

At the general monthly meeting, held at the Crown and Anchor Hotel, on December 1st, only five members attended. The minutes of the last monthly meeting and committee meeting having been read the president suggested that certain remarks he had made with reference to the painstaking manner in which the secretary always performed the work of the association ought not to have been omitted. Other members agreeing, the minutes were amended accordingly.

One new member was elected, and the membership now stands at 47.

There is nothing to report from the Eastern Counties Federation, nor from the following local associations affiliated to it: Cambridge, Norwich.

THE SOUTH-WESTERN CENTRE OF THE NATIONAL FEDERATION.

COMPOSED OF

The South-Western Federation, and The South Wales Federation.

Secretary : W. F. LONG, 3, Northumberland Buildings, Bath.

LOCAL ASSOCIATIONS AFFILIATED TO THE SOUTH-WESTERN FEDERATION.

BRISTOL ASSOCIATION.

Secretary: A. J. Pitt.

The ordinary monthly meeting of the Bristol Association was held on December 17th, when Mr. Frank N. Cowlin occupied the chair.

A letter was read from Mr. A. G. White, secretary of the National Federation, acknowledging receipts of this association's communication suggesting the amendment of clause 20 of the National Form of Contract, and promising to bring same before the Emergency Committee of the Federation.

A communication was read from the Town Clerk of Bristol in regard to Rule 1 of the working rules, which provides that the hours of labour shall be from 6 or 6.30, or 8 or 8.30 until 5 p.m., and asking whether this was to be read that an employer was entitled to open his works at 6.30 or 8.30 as the case may be, as, in his opinion, the reading of this rule was rather indefinite. The president said that undoubtedly it was rather vague, but it was understood throughout the district that the hour for commencing work was 6 or 8 a.m., according to the season of the year, and that the half-hour was only inserted to meet the case of a workman who may be a few minutes late in getting to his work. He thought, however, that in order to make the reading of the rule beyond question, it would be well to approach the operatives as to deleting the 6.30 or 8.30 wherever they occurred in the rule. This was agreed to.

The following members were elected as representatives of the Association on the South-Western Federation: Messrs. F. Chown, J. Lovell, George Humphreys, E. I. Neale and Audley Perkins.

The hon. treasurer was authorised to pay the subscription to the South-Western Federation.

Arising out of a small collection made by the hon. treasurer as a Christmas gift for an old builder who had fallen upon hard times, the president said he should like to see a benevolent society formed in connection with the association, so that they might be able to extend a helping hand to any of their members who, in these strenuous times, had fallen by the wayside.

This suggestion was heartily endorsed by the members present, and it was resolved to give further consideration to the matter at an early date.

There is nothing to report from the South-Western Centre, nor from the South-Western Federation, nor from the following local associations affiliated to the South-Western Federation: Bath, Bridgwater, Cheltenham, Exeter, Gloucester, Hereford, Stroud, Taunton.

THE SOUTH WALES FEDERATION.

Secretary : W H. BILLINGS, Salubrious Chambers, Swansea.

There is nothing to report from the South Wales Federation, nor from the following local associations affiliated to it: Cardiff, Newport, Pontypridd, Swansea.

SCOTTISH BUILDING TRADES FEDERATION.

Secretary : JAMES CAMERON, Solicitor, 61, Lothian Road, Edinburgh.

There is nothing to report from the Scottish Building Trades Federation, nor from the following associations affiliated to that association: Aberdeen, Alloa, Dingwall, Dumfries, Dundee, Edinburgh, Leith, and District, Hawick, Inverness, Keith, Kilmarnock, Oban, Paisley, Perth.

Practical Notes for Architectural Draughtsmen.

By ALFRED W. S. CROSS, M.A., F.R.I.B.A.,
and ALAN E. MUNBY, M.A., A.R.I.B.A.

Complete Set Now Ready (27 Large Plates in a Portfolio), 12s.
POST FREE, 12s. 6d.

Prof. C. H. REILLY, of Liverpool University, says: "I think it is a very valuable book, and I hope it will find its way into most architectural offices."

THE "PRACTICAL NOTES" gives in most convenient form for use on the drawing board examples with concise rules, explanations and dimensions for preparing Designs, Perspectives and Working Drawings for Classical Architecture with rapidity and precision.

STUDENTS preparing for the examinations of the R.I.B.A. can learn how to draw The Orders correctly with the smallest possible amount of study and work by utilising the invaluable drawings and data given in this publication.

Architect's estimate, £12,000.

Northern Polytechnic Architectural and Building Students' Association.

The seventh annual dinner of this association was held at the Covent Garden Hotel last month. Mr. Henry T. Hare, F.R.I.B.A., who presided, was supported by Alderman Smallwood and Mr. Hugh Davies (president of the association, and head of the architectural and building trades department of the institute). Mr. Hare said that for some years he had been very much interested in the promotion and establishment of classes in connection with his own profession of architecture, and any institution which had for its object the furthering of technical education and especially the training of students of all branches of the building trade, had his heartiest sympathy. There had been, however, cases in which youths who, having had a course of training at a technical school, had gone forth representing themselves as full-flown architects. This he regarded as a great pity.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Jan. 14. TALYBONT.—Erection of a house at Talybont, Cardiganshire, for D. Williams. Plans and specification may be obtained on application to G. T. Bassett, A.R.I.B.A., architect and surveyor, Aberystwyth, to whom tenders should be delivered by Jan. 14.

January 14. DARLASTON.—Erection and completion of a handicraft centre at Darlaston (on the site of the Central Council School), for the Staffordshire Education Committee. Builders desirous of tendering should apply to G. Balfour, Director of Education, County Education Offices, Stafford, on or before Jan. 14. Quantities will be supplied upon receipt of a deposit of 10s. 6d., which should accompany the application to tender.

Jan. 14. EDINBURGH.—Unclimbable fencing at Balgreen Road, Saughton Park, according to plans and specification, which may be seen at the Public Works Office, where also schedules of quantities may be had on personal application. The estimates must be sent addressed to J. A. Williamson, city superintendent of works, Public Works Office, City Chambers, Edinburgh, by 10 a.m. on Jan. 14, sealed and marked "Tender for Fencing, Saughton Park."

Jan. 15. BIRKENHEAD.—Erection and completion of extensions to the infectious diseases hospital, Flaybrick Hill, for the Birkenhead Corporation. Plans, specification and particulars can be seen, and bills of quantities and form of tender obtained on application at the office of C. Brownridge, borough engineer and surveyor, upon a deposit of the sum of £1 1s. Fair wages clause. Securities required. Tenders, upon the printed form supplied, sealed and endorsed "Tender for Extensions, Infectious Diseases Hospital," to be sent to J. Fearnley, town clerk, Town Hall, Birkenhead, not later than 4 p.m. on Jan. 15.

Jan. 15. CWMPARK.—Extensions, formation, and enclosing of new playground, and painting and colouring at the Park Council School, Cwmpark, for the Rhondda U.D.C. Plans and specification may be seen and bills of quantities and tender form obtained at the office of J. Rees, architect, Hillside Cottage, Pentre, upon the production of a receipt from the accountant of the Council for the required deposit of £1 1s. Sealed tenders, endorsed "Tender for Extensions, etc., at Park School," accompanied by the priced quantities, under separate cover, duly endorsed, must be delivered before noon on Jan. 15, at the Council Offices, Pentre, addressed to the chairman of the Building Committee.

Jan. 16. BLAENPLWYF.—Erection of a house at New Inn, Blaenplwyf, for T. Jenkins. Plans and specification may be obtained on application to G. T. Bassett, A.R.I.B.A., architect and surveyor, Aberystwyth, to whom tenders should be delivered by Jan. 16.

Jan. 16. HALE.—Erection of Altrincham Higher Elementary School, Queen's Road, Hale, Cheshire. Contractors desirous of tendering are invited to send in their names to J. Howarth, clerk to the committee, Education Offices, Market Street, Altrincham, not later than Jan. 16, with the sum of £2 2s.

Jan. 16. BOWDON LODGE.—Erection of Altrincham County High School for Girls, Bowdon Lodge, Cheshire. Contractors desirous of tendering are invited to send in their names to J. Howarth, clerk to the committee, Education Offices, Market Street, Altrincham, not later than Jan. 16, together with the sum of £2 2s.

Jan. 16. DORE.—Erection of two detached villas, at Dore. Builders desirous of tendering are requested to apply for bills of quantities not later than Jan. 16, after which date plans and conditions of contract may be seen at the office of J. W. Winter, architect, surveyor and valuer, St. Peter's Close, York Street, Sheffield.

Jan. 16. CHEPSTOW. — Repairs to playgrounds, road, and other works at the Chepstow Boys' Council School and Chepstow Girls' and Infants' Council School. Plans and specification may be seen at the offices of C. Dauncey, secretary, County Council Offices, Newport, Mon., to whom sealed and endorsed tenders, in separate envelopes for each school, are to be delivered on or before Jan. 16.

Jan. 16. HOUGHTON-LE-SPRING.—Construction of an underground public convenience in Newbottle Street, near the Council Offices, for the U.D.C. Plans and specifications may (by appointment) be seen and all particulars obtained, together with form of tender, at the office of the surveyor of the Council, Newbottle Street, Houghton-le-Spring. Securities required. Tenders, endorsed "Tender for Public Convenience," must be delivered to D. Miller, clerk of the Council, Houghton-le-Spring, not later than Jan. 16.

Jan. 18. EAST STONEHOUSE.—Adapting part of the constable's house at Devil Point, East Stonehouse, for the purpose of a public convenience, for the U.D.C. Persons wishing to tender for the work, are requested to send their names to C. H. Trounce, surveyor, surveyor's department, Town Hall, Stonehouse, Devon.

Jan. 18. ECCLES.—Erection of houses in Corporation Road, Eccles, for the Corporation. A copy of the bill of quantities and general conditions may be obtained at the town clerk's office, on depositing the sum of £1 1s. The plans may be inspected and further particulars obtained at the office of L. Barlow, architect, 8, King Street, Manchester. Tenders, endorsed "Tender for Houses," to be delivered to E. Parkes, town clerk, Town Hall, Eccles, in the official envelope provided, not later than 10 a.m. on Jan. 18.

Jan. 18. LONDON, E.—Erection of a residence for the medical officer upon the Isolation Hospital site at Boundary Road, East Ham, in accordance with drawings and specifications which may be obtained on application to A. H. Campbell, borough engineer, Town Hall, East Ham, E. The persons tendering are required to deposit a cheque or Bank of England note for the sum of £5. Tenders are to be forwarded enclosed in an envelope duly sealed and addressed to "The Worshipful the Mayor, Town Hall, East Ham, E.," and endorsed "Residence for Medical Officer," not later than 12 o'clock noon, Jan. 18. Fair wages clause.

Jan. 19. THRYBERGH.—Erection of working men's club, Thrybergh, near Rotherham. Plans may be seen and quantities obtained at 14, Regent Street, Barnsley, to Jan. 19, on which date sealed and endorsed tenders are to be delivered at the aforementioned address.

Jan. 19. PLYMOUTH.—Providing and fixing two ventilators and new skylight in the roof of the kitchen at the workhouse; also for the provision of a mortuary slab, with necessary accessories, for the Guardians of the Poor. Specifications may be obtained between the hours of 10 a.m. and 4 p.m. at the clerk's office. Tenders, endorsed "Tender for skylight, ventilator, etc.," must be sent to W. Adams, clerk to the guardians, 13, Princess Square, Plymouth, not later than 12 noon on Jan. 19.

Jan. 20. TAUNTON.—Erection of a covered playground, changing room, bathroom, box-room, etc., for the Council of Taunton School. The plans and specification may be seen, and bills of quantities obtained at the architect's office. Sealed tenders, upon the form supplied, addressed to F. W. Roberts, architect, 2, Hammet Street, Taunton, and endorsed "Tender for Taunton School," must be delivered on or before noon on Jan. 20.

Jan. 20. COLLINSTOWN.—Carrying out additions and alterations to Collinstown Church, Co. Westmeath, according to the plans and specification, which may be seen at the Parochial House, Collinstown, or at the office of L. O'Callaghan, architect, 31, South Frederick Street, Dublin. Tenders, endorsed "Tender for Alterations and Additions, Collinstown Church," and addressed to the Rev. N. Woods, Adm., to be delivered at the Parochial House, Collinstown, not later than 5 p.m. on Jan. 20.

Jan. 22. ILFRACOMBE.—Erection of a new post-office at Ilfracombe, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification and a copy of the conditions and form of contract may be seen on application at the present post-office. Bills of quantities and forms of tender may be obtained at the undermentioned address on payment of £1 1s. Tenders must be delivered before 12 o'clock noon on Jan. 22, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W., and endorsed "Tender for Ilfracombe New Post-Office."

Jan. 23. MANCHESTER.—Erection of the new Municipal Secondary School for girls in Chorlton Street, for the Education Committee. Plans may be seen and a copy of the bills of quantities (including specification) may be obtained at the Elementary Education Office, Deansgate, Manchester, on a deposit of £3 3s. (cheques to be made payable to the Accountant). Tenders on the forms provided, addressed to "The Chairman of the Education Committee," must be delivered at the School of Technology before noon on Jan. 23.

Jan. 25. LITHERLAND.—Erection of a cookery and laundry centre at Lander Road Council school, Litherland, for the Lancs. Education Committee. The plans may be seen and bills of quantities obtained at the office of H. Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before 12 o'clock noon on Jan. 25, sealed and endorsed, to J. Dean, 22, Lord Street, Liverpool.

Jan. 25. SACRISTON.—Erection and completion of new workmen's club at Sacriston, Co. Durham. Drawings, specifications, and conditions of contract may be seen and forms of tender may be obtained at the architect's office, 22, Durham Road, Blackhill, Co. Durham. Tenders to be sent in to R. Herbert, secretary, Workmen's Club, Sacriston, Co. Durham, not later than Jan. 25, duly endorsed as above.

January 26. LONDON, N.—Supply and erection of open pale oak fencing at Finsbury Park, N., for the L.C.C. Persons desiring to submit tenders may inspect the drawing and obtain the specification, form of tender, and other particulars at the Parks Department, 11, Regent Street, S.W. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover addressed to the clerk of the L.C.C., Spring Gardens, S.W., and marked "Tender for Oak Fencing, Finsbury Park." No tender received after 11 a.m. on Jan. 26 will be considered.

Jan. 27. PORTSMOUTH.—Erection of quarters for assistant medical officers, medical officers' residence, and an extension of the Nurses' Home at the Workhouse Infirmary at Milton, Portsmouth, for the Guardians of the Poor. Fair wages clause. Local contractors only will be allowed to tender. The drawings and specifications may be inspected at the offices of Rake and Cogswell, architects, Prudential Buildings, Commercial Road, Portsmouth, and copies of the bills of quantities obtained on payment of a sum of £2 2s. Sealed, endorsed tenders, marked "Tenders for Building, etc.," addressed to the chairman of the Board, must be delivered at the Workhouse, Milton, not later than noon on Jan. 27.

January 27. DUBLIN.—Erection of a new ward block and boiler house etc., at the Military Hospital, Arbour Hill, Dublin, for the Secretary of State for War. Plans, specifications, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 6, Pall Mall, London, S.W., or at the Barrack Construction Office, Arbour Hill Hospital, Dublin, on Jan. 13, 14, and 15. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Jan. 18. The application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for credit to Army Funds." Tenders on the form supplied, with the bills of quantities, must be delivered in sealed envelopes, marked "Tender for New Ward, etc., Military Hospital, Arbour Hill, Dublin," not later than 12 noon on Jan. 27, addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W. The bills of quantities should accompany tender in a separate sealed envelope, similarly addressed, and marked "Bills of Quantities for New Ward, etc., Arbour Hill Hospital, Dublin," with the contractor's names and addresses thereon.

Jan. 30. BRISTOL.—Erection of a new elementary school, at Soundwell Road, Staple Hill, Bristol, for the Gloucestershire Education Committee. Bills of quantities can be obtained from R. S. Phillips, architect, Midland Bank Chambers, The Cross, Gloucester, upon depositing £2 2s. Tenders must be delivered by 9 a.m. on Jan. 30.

Feb. 1. LONDON, N.W.—Construction of coal bays, fittings, and other workships, stores, lodge, cottages, etc., at Cricklewood, and cottages, etc., at Kempton Park, in the county of Middlesex, for the Metropolitan Water Board. Forms of tender, conditions of contract, specification and bills of quantities may be obtained from the engineer, Staines Reservoirs Communication Works, The Firs, Southern Road, Fortis Green, East Finchley, N., on the production of an official receipt for the sum of £10, which sum must be deposited with the accountant to the Board, Savoy Court, Strand, W.C. Such payments and applications can be made any week-day (except Thursdays and Saturdays) between the hours of 10 a.m. and 4 p.m. Tenders, addressed to the clerk, Metropolitan Water Board, Savoy Court, Strand, W.C., and endorsed "Tender for Coal Bays, etc., Cricklewood and Kempton Park," must be delivered in sealed envelopes at the offices of the Board, not later than 10 a.m. on Feb. 1.

No date. BEN RHYDDING.—Erection of two villas at Ben Rhydding. Deposit 5s. Quantities can be obtained of C. H. Brooke, architect, 7, Cookridge Street, Leeds.

No date. TERRINGTON ST. CLEMENT.—Erection of slaughter-house, stable, etc., converting two cottages into dwelling-house, and general improvements, for A. J. Collison at Terrington St. Clement. Plan and specification may now be seen at the offices of Walker and Walker, architects, 2, Lower Hill Street, Wisbech.

ENGINEERING.

Jan. 18. BECKENHAM.—Electric wiring of houses in their district, for the U.D.C. Specifications, general conditions, and forms of tender can be obtained on payment to the Council's collector of the sum of £2 2s. The collector attends at the Council offices, Bromley Road, Beckenham, from 9 to 10 a.m. daily. For any further information with regard to the proposed contract, application should be made to J. E. Tapper, resident engineer, Electricity Works, Church Fields Road, Beckenham. Sealed tenders, endorsed "Wiring," to reach F. Stevens, clerk of the Council, Council Offices, Beckenham, not later than 4 p.m. on Jan. 18.

Jan. 18. GLASGOW.—Construction of the Works in the Counties of Stirling and Perth, authorised by the Glasgow Corporation (Water and General) Order, for raising the level of Loch Arklet and conveying water therefrom to Loch Katrine. Copies of the specification, schedule of quantities, and form of tender, together with prints of the drawings, may be obtained from J. R. Sutherland, the engineer to the Water Department, 45, John Street, Glasgow, upon payment to the Water Treasurer, 45, John Street, Glasgow, of £10 10s. The resident engineer will meet intending contractors on the site of the works, at 10 a.m. on Jan. 6 and 7. Sealed offers, marked "Water Department—Tender for Loch Arklet Works," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, on or before 12 o'clock noon, on Jan. 18.

Jan. 19. LONDON, W.—Altering Lifts and Fans at present worked by continuous current lifts and 2 fans to work from single-phase alternating current and 2 fans to work from steam engine. Schemes and tenders are invited by the Parish of Hammersmith. Firms tendering to specify what allowance they are prepared to make for present transforming plant and continuous current motors. Drawings, detailed specifications, etc., to be supplied free of cost to the Guardians. Tenders, endorsed "Tender for Altering Lifts, etc.," to be delivered before Jan. 19, to J. Lamb, clerk to the Guardians, 206, Goldhawk Road, Shepherd's Bush, from whom specification can be obtained.

Jan. 20. CAIRO.—Supply of a universal milling machine (machine à fraiser) required by the Khedival School of Arts and Trades. Tenders must be made on stamped paper of 3 Egyptian piastres (obtainable from Lt.-Colonel Western, C.M.G., Queen Anne's Chambers, Broadway, Westminster, S.W.), and should be accompanied by full particulars and plans, etc., of the machine offered. They should be addressed to the Director of the School of Arts and Trades, Cairo, where they will be received up to noon on Jan. 20. Tenders should be endorsed "Offre pour fourniture d'une machine à fraiser." The copy of the specifications and conditions mentioned above (in French) may be examined by British makers on application at the Commerçial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Jan. 26. LONDON, S.W.—Laying of stoneware cable-ducts, for the L.C.C. Full particulars, and also information as to the conditions to be observed by tenderers, will be found in the "London County Council Gazette" of Jan. 4 and subsequent issues. Tenders must be upon the official forms to be obtained from the clerk of the Council, County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of the sum of £2 for the specification, etc. Full particulars of the work may be obtained on application at the County Hall, before the payment of the fee for the specification, etc. No tender received after 11 a.m. on Jan. 26. will be considered.

Jan. 27. LONDON, W.—Supply of 1-2,000 k.w. steam turbine generating set, with condenser, for the Metropolitan B.C. of Hammersmith. Specification and form of tender can be obtained from G. G. Bell, borough electrical engineer, Electricity Department, 85, Fulham Palace Road, W., upon payment of £1 1s. Tenders, endorsed "Turbine Generating Set," must be delivered to H. Thompson, town clerk, Town Hall, Broadway, Hammersmith, not later than 4 p.m. on Jan. 27.

IRON AND STEEL.

Jan. 16. GLASGOW.—Supplying about 400 tons of cast-iron pipes, 18 in. in diameter, for the Corporation. Drawings may be seen, and copies of the specification and forms of tender obtained on application to J. R. Sutherland, engineer to the water department, 45, John Street, Glasgow. Sealed offers, marked outside "Tender for Pipes, Water Department," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, on or before Jan. 16.

Jan. 19. SOUTH DARLEY.—Manufacture and delivery at Darley Dale Station (Midland Railway) of about 160 tons of 5 in., 4 in., and 3 in. cast-iron spigot and socket pipes, together with all bends, junctions, tapers, and other specials (vertically cast pipes of British manufacture only), for the U.D.C. Also for cutting trenches and hauling, laying and jointing about 8,000 lin. yds. of 5 in., 4 in., and 3 in. cast iron pipes; the provision and fixing of valves, etc.; the construction of intake works at Stanton Lees, and the construction of a ferro-concrete reservoir at Wensley Hill (capacity 97,500 gallons), and other works incidental to the contract. The whole of the works will be let in one contract, and will not be divided. Plans may be seen at Market Hall Chambers, Matlock. Specification, bill of quantities, and form of tender can be obtained on application to Taylor, Wallin and Taylor, engineers, Cathedral Buildings, Newcastle-upon-Tyne, on payment of £3 3s. deposit. Sealed tenders, on the prescribed form, with schedule of prices, etc., properly filled in, endorsed "South Darley Waterworks," must be delivered to R. Taylor, clerk to the Council, Market Hall Chambers, Matlock, Derbyshire, not later than Jan. 19.

Jan. 26. YNYSCYNHAIARN.—(1) For about 150 tons 3in. to 8in. cast or steel gas main and fittings for the U.D.C. Specifications and forms of tender can be obtained from J. Jones, clerk to the Council, Town Hall, Portmadoc, on payment of £1 1s. Tenders, addressed to the undersigned and endorsed "Tender for ——," to be delivered not later than Jan. 26.

March 1. CAIRO.—Construction of a floating dock for the Administration of the Egyptian State Railways. Specifications, price 10s., may be obtained from Lt.-Colonel Western, C.M.G., Queen Anne's Chambers, Broadway, Westminster, London, S.W. Tenders will be received by the General Manager, Egyptian State Railways, Cairo, up to noon on March 1

PAINTING.

Feb. 2. MANCHESTER.—Painting at the undermentioned places, for the Directors of the Lancashire and Yorkshire Railway. 1, from Southport (Central) to Preston; 2, Wigan to Southport; 3, at Blackburn; 4, Burnley to Todmorden; 5, at the carriage and wagon works, Newton Heath; 6, Newton Heath to Rochdale, and the Middleton branch; 7, Rochdale to Sowerby Bridge; 8, Sowerby Bridge to Mirfield and at Dewsbury Junction; 9, at Bradford; 10, at Hull. Specifications and separate forms of tender may be obtained on personal application at the engineer's office, Hunt's Bank, Manchester. Tenders, endorsed "Tender for Painting," to be in the hands of R. C. Irwin, secretary, Hunt's Bank, Manchester, not later than 10 o'clock on the morning of Feb. 2.

PLUMBING & SANITARY

Jan. 16. PADSTOW.—(1) Construction of a stoneware pipe sewer, with all necessary excavations, manholes, and other works, and with cast-iron pipe outfall into the Estuary of the River Camel, including 594 yds. run of 12 in., 9 in., and 6 in. stoneware pipe sewers, and 92 yds. of 1 ft. 6 in. cast-iron pipe sewers. (2) The construction of a piece of road 350 ft. long and 35 ft. wide, providing all necessary metalling, etc., including the construction of a footpath 5 ft. wide on either side of the road, with proper kerbing and channelling, etc., near the railway station, Padstow. Plan and specification may be seen on application to R. T. Hocking, Manor Office, Padstow, or at the office of T. H. Andrew, engineer, Market Hill, St. Austell. Tenders must be sent to Shilson, Coode, and Co., solicitors, St. Austell, on or before Jan. 16.

Jan. 18. SPENNYMOOR.—(a) Extension of the main sewer in Durham Road, Spennymoor; (b) road-making, etc., required in the widening of Ridley's Buildings, Spennymoor, for the U.D.C. Plans, specifications, etc., may be seen and forms of tender obtained, on application to C. R. Spencer, surveyor to the Council, Silver Street, Spennymoor. Tenders, endorsed respectively "Durham Road Sewer" and Ridley's Buildings" to be sent to F. Badcock, clerk to the Council, Council Offices, Spennymoor, not later than Jan. 18.

Jan. 19. SHOEBURYNESS.—Construction of about 540 yds. of surface water drain, with manholes and gulley connections, at Shoeburyness, for the U.D.C. Plans, sections, and specifications may be seen, and schedules of quantities and form of tender obtained of H. A. Harris, surveyor, Clarence Street, Southend, on payment of a deposit of £1 1s. Sealed tenders, marked "Tender for Drain," must be sent to F. Gregson, clerk, 46, Alexandra Street, Southend-on-Sea, not later than 3 p.m. on Jan. 19.

Jan. 21. LEEDS.—Sewerage works for the Sewerage Committee in (1) Hyde Terrace; (2) Kirkstall Lane; (3) Beeston, near Royds; (4) Coal Hill Lane. Drawings may be seen, and forms of tender with copies of the documents forming the contract may be obtained on application to W. T. Lancashire, city engineer, Municipal Buildings, Leeds, on payment of a deposit of £3 3s. Tenders must be on the official form, enclosed in a sealed cover, and endorsed "Sewerage Works," addressed to the Town Clerk, and delivered at the Town Hall, Leeds, not later than 10 a.m. on Jan. 21.

Jan. 23. LEVENSHULME.—Length of 12 in. surface water drain from the culvert in Broom Lane to Thorncliffe Grove, in the Council's district, for the U.D.C. Specifications, bills of quantities and further particulars may be obtained on application to J. Jepson, Moseley Chambers, 35, Great Underbank, Stockport, surveyor to the Council. Tenders, endorsed "Tender for Surface Water Drain," to be sent to J. O. Hardicker, clerk to the Council, Northern Assurance Buildings, Albert Square, Manchester, not later than Jan. 23.

ROADS AND CARTAGE.

Jan. 18. PLYMOUTH.—Making up and completing, under section 150 of the Public Health Act, 1875, the following streets and lanes, for the Corporation: 1, Cleveland Road (footway); 2, Eton Street; 3, Lipson Hill Terrace Lane; 4, Lucas Terrace extension. Plans and specifications and conditions upon which forms of tender will be granted may be seen at the office of J. Paton, borough engineer, Municipal Offices, Plymouth, and bills of quantities obtained. Sealed tenders must be delivered at the said offices not later than 5 p.m. on Jan. 18.

January 18. LONDON, S.W.—Making-up and paving of the new part of the street called Wimbledon Road, Balham, and Springfield, lying between Garratt Lane and the Borough Boundary, for the Metropolitan B.C. of Wandsworth. The specification and drawings may be seen, and forms of tender obtained, at the borough engineer's office, New Streets Department, 56, East Hill, Wandsworth, S.W., between the hours of 10 and 4 (Saturdays 10 and 12). Tenders, enclosed in sealed envelopes, and endorsed "Tender for Paving Wimbledon Road," must be delivered at the Council House, East Hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose not later than four o'clock in the afternoon of Jan. 18. Securities required. Fair wages clause.

Jan. 20. BOURNEMOUTH.—Making up Frederica Road. Full particulars forms of tender, specification, and schedule can be obtained of F. W. Lacey, borough engineer, Municipal Offices, Bournemouth, at whose office drawings can be seen, provided that the sum of £1 1s. has been previously deposited in respect of the tender. Tenders to be sent in, in envelopes furnished for the purpose, to G. W. Bailey, town clerk, before 11 a.m. Jan. 20.

Jan. 20. BOURNEMOUTH.—Making up Oxford Avenue (first portion). Full particulars, forms of tender, specification, and schedule can be obtained of F. W. Lacey, borough engineer, Municipal Offices, Bournemouth, at whose office drawings can be seen provided that the sum of £1 1s. has been previously deposited in respect of the tender. Tenders to be sent in, in envelopes furnished for the purpose, to G. W. Bailey, town clerk, before 11 a.m. of Jan. 20.

Jan. 20. WOODBRIDGE.—Supply of granite or basalt, broken to pass through a $\frac{1}{4}$ in. and not less than $1\frac{1}{2}$ in. gauge, for the R.D.C., at Council's Wharf, at Wilford Bridge or Melton G.E.R. Station, 1,000 tons. Whole chalk flint:—At Council's Wharf, at Wilford Bridge, 2,500 tons; at Levington Creek and Nacton Hard, 400 tons; at Westerfield G.E.R. Station or delivered on roads at Tuddenham and Witnesham, 300 tons. Wash Mill Flints of the very best quality:—At Council's Wharf at Wilford Bridge, 1,000 tons; at Levington Creek and Nacton Hard, 300 tons; at Waldringfield Hard, 300 tons; at Boyton Dock, 150 tons. All materials to be delivered between April 1 and Sept. 1, at such times and in such quantities as the surveyor may direct, and will be subject to his approval. No form of tender will be supplied. Tenders, accompanied by samples, to be delivered (carriage paid) to H. E. Kell, Council Offices, Woodbridge, endorsed "Tender for Road Material," on or before 10 a.m. on Jan. 20. Any further information may be obtained of G. Cook, district surveyor, Grundisburgh, near Woodbridge, by enclosed stamped envelope.

January 21. CROYDON.—Making-up Foxley Hill Road, Purley, and Graham Avenue, Mitcham, for the Croydon R.D.C. Plans and specification may be seen and form of tender obtained on application to R. M. Chart, surveyor to the Council, Town Hall, Croydon. Sealed tenders to be delivered to E. J. Gowen, clerk of the Council, not later than 12 o'clock noon on Jan. 21.

Jan. 22. SPILSBY.—Supply of about 5,000 tons of broken granite, 9,000 tons of broken slag, and 400 tons of slag chippings, for the R.D.C., to be delivered in such quantities and at such times as the Council shall require and direct. Specifications, conditions of contract, and forms of tender, showing the stations at which the material is to be delivered and the approximate quantity to be delivered at each station, may be obtained on application to W. C. Brakenridge, district surveyor of highways, Spilsby, to whom a small sample box of stone must be sent. Tenders, endorsed on the cover "Tender for Road Material," must be delivered at the office of G. B. Walker, clerk, Spilsby, not later than Jan. 22.

January 23. NORWICH.—Supply of granite for the year ending March 31, 1910, for the Norfolk C. C. Specification and form of tender may be obtained at the office of T. H. B. Heslop, county surveyor, The Shirehouse, Norwich, upon receipt of a 2d. stamped addressed large foolscap envelope. Tenders can only be received on the forms provided, and must be endorsed "Tender for Granite," to be sent in to the clerk to the Council, the Shirehouse, Norwich, on or before Jan. 23.

Jan. 23. BIRMINGHAM.—Supply of materials for one year, ending March 31, 1910, for the Public Works Committee:—Granite kerbs, setts, crossing stones, chippings, flags, paving bricks, wood paving blocks, ragstone, gravel, sand and slag. Forms of tender, copies of conditions, and specifications may be obtained, at the city surveyor's office, Council House, Birmingham, on payment of £1 for each copy. Samples of materials tendered for must be sent, carriage paid, to H. E. Stilgoe, city engineer and surveyor, The Council House, Birmingham. Tenders must be made out on the forms provided, and delivered at the surveyor's offices on Jan. 23, endorsed "Tender for Stone, etc.," and addressed to the City Surveyor, Council House, Birmingham. Securities required.

January 25. PENGE.—Private street works in Challin Street, for the U.D.C. within their district. Plans and specification may be seen and copy of the bill of quantity with form of tender obtained on application to H. W. Longdin, surveyor, Town Hall, Anerley, S.E., on payment of £2. Sealed tenders, accompanied by priced quantities, endorsed "Tender for Roadmaking," to be delivered to C. W. Dommett, clerk to the Council. Town Hall, Anerly, S.E., not later than 12 o'clock noon on Jan. 25.

Jan. 26. LONDON, S.E.—Supply of 200 tons of waste and broken pieces of Jersey or Guernsey granite for breaking, for the Guardians of the Poor of the parish of Lambeth, to be delivered at their stone yard, in Wincott Street, Kennington Road, S.E., having first been weighed by the contractor at the weighbridge of the workhouse in Renfrew Road. Tenders, with full specification, including name of quarry, must be sent to J. L. Goldspink, clerk, Guardians' Board Room and Offices, Brook Street, Kennington, S.E., sealed and superscribed "Tender for Granite," on or before Jan. 26, and will be opened at the board room on Jan. 27. The tenders may be placed in the box provided for their reception, in the office of the clerk to the Guardians, by the contractors or their representatives should they so desire. A small sample of the stone to be supplied should be sent.

Jan. 28. TUNBRIDGE WELLS.—Paving, metalling, and making up of Campbell Road and Culverden Avenue, for the B.C. Plans, sections, and specifications can be seen, and copies of the bill of quantities can be obtained at the office of W. H. Maxwell, borough engineer and surveyor, Town Hall, Tunbridge Wells. Securities required. Tenders, endorsed "Private Street Works," to be sent to W. C. Cripps, town clerk, Town Hall, Tunbridge Wells, on or before 9 a.m. on Jan. 28.

Feb. 2. HATFIELD.—Supply of broken granite and slag required for the main roads during the year ending March 31, 1910, for the Herts. C.C. Forms of tender and condition of contract may be obtained on application at the office of U. A. Smith, county surveyor, Hatfield, or will be sent through the post upon receipt of a stamped addressed foolscap envelope. Tenders, which must be upon the forms provided, are to be delivered not later than Feb. 2.

Feb. 6. CHELMSFORD.—Supply of Norway granite kerb, and setts, for the year ending March 31, for the Essex C.C. Forms of tender and the special envelope in which the tenders are to be delivered, and all other information and particulars, can be obtained at the chief surveyor's office at Chelmsford. Tenders to be delivered on or before Feb. 6, to P. J. Sheldon, chief surveyor, Chelmsford.

Feb. 17. GLOUCESTER.—Supply of stone for use on main roads for the year beginning April 1. Forms of tender can be obtained from E. S. Sinnott, county surveyor, Shire Hall, Gloucester, on and after Jan. 23, and tenders must be received not later than Feb. 17, marked outside "Tenders for Material."

MISCELLANEOUS.

Jan. 15. MANCHESTER.—Supply of the following stores required during the six months ending July 31, for the Directors of the Manchester Ship Canal Co.:—1, iron, steel, and files; 2, ironmongery, nails and bolts; 4, white and red lead, pitch. Specifications and forms of tender may be obtained on application at the Stores Department, Manchester Docks, Trafford Road, Salford. Intending contractors are requested to particularise the class of stores for which they wish to tender. Sealed tenders, endorsed "Tender for ," must be delivered to F. A. Eyre, secretary, 41, Spring Gardens, Manchester, not later than 10 a.m. on Jan. 15.

Jan. 16. DUNDEE.—Supply and delivery of fireclay retorts, fireclay bricks and materials, retort bolts and nuts, for the Gas Commissioners. Specifications, drawings and forms of tender may be obtained on application to A. Yuill, engineer and manager, Dundee Gas Works. Sealed and endorsed tenders to be lodged with W. H. B. Martin, clerk to the Gas Commissioners, City Chambers, Dundee, not later than Jan. 16.

Jan. 19. HEYWOOD.—Supply of retorts and fireclay goods, for the Gas Committee of the Corporation. Specification and quantities and form of tender may be obtained upon application to W. Whatmough, Gas Manager. Tenders, endorsed "Retorts and Fire-clay Goods," to be sent to G. G. Bouchier, town clerk, Municipal Buildings, Heywood, not later than Jan. 19.

Jan. 20. HALIFAX.—Supply of the following stores and materials required in the undermentioned departments of the Halifax Corporation during the twelve months ending March 31, 1910:—Highways and Tramways Departments: Portland cement, stoneware pipes, etc., oils, paints, etc., iron castings, ironmongery, artificial flags, manhole covers, gullies, timber, granite, limestone, lime, paving setts—sandstone, paving setts—granite, kerbstones, flags, bricks, puddles, and drain tiles. Forms of tender, specifications, and further particulars may be obtained on application to J. Lord, borough engineer, Town Hall, Halifax. Tramways and Electricity Departments—Schedule: No. 1, iron and steel; 2, timber; 3, bolts and nuts; 4, ironmongery, including washers, nails, screws, etc.; 5, glass; 6, lighting fittings; 10, oils and grease; 11, paints and varnishes; 14, castings (malleable iron, cast-iron, and brass), 15, tubes and fittings. Samples may be seen on application at the Stores, Skircoat Depot, any day, Monday to Friday, between 9 a.m. and 4 p.m. Forms of tender and full information may be obtained at the General Manager's Office, Skircoat Road. Intending contractors must state the number of schedule required. Tenders, in the envelope provided, must be sent to K. Walton, town clerk, on or before Jan. 20. Any samples submitted by the tenderers, which will not be paid for by the Corporation, must be marked "Sample—Tender for Stores," and sent to the borough engineer, Town Hall, and General Manager's office, Skircoat Road, respectively.

Jan. 21. PLYMOUTH.—Supply of the following goods and materials for the period of one year, for the Corporation Waterworks:—Fire hydrants, lead pipe and pig lead, stopcocks, ferrules, etc., cast-iron work, sluice valves. Particulars and forms of tender can be obtained at the office of F. Howarth, water engineer, Municipal Buildings, Plymouth. Tenders, enclosed in envelopes provided, to be delivered at this office by twelve o'clock noon on Jan. 21.

Jan. 21. LONDON, S.E.—Supply of broken granite, broken flints, gravel, ballast, sand, tar-paving, stock bricks, Portland cement, lime, timber for sewer work, for the Lambeth B.C. for one year from March 31. Also for cartage of materials, etc. Specifications and forms of tender may be obtained from H. Edwards, borough engineer, Town Hall, Brixton Hill, S.W., between the hours of 10 and 4 (Saturdays 10 and 12). Tenders must be delivered (in the official envelope supplied) at the Town Hall not later than 12 o'clock noon on Jan. 21.

Jan. 23. BIRMINGHAM.—Supply of stores for one year, ending March 31, 1910, for the Public Works Committee: Lias lime, Portland cement, drain pipes, gullies, gully pans, brown bricks, timber, castings, iron and steel ware, glass, and miscellaneous stores. Samples and patterns may be seen on application to the storekeeper at the Lamp Department, Park Street, and the Corporation Wharf, Sheepcote Street. Forms of tender, copies of conditions, and specifications may be obtained at the city surveyor's office, on payment of £1 for each copy. Samples of goods tendered for must be sent, carriage paid, to H. E. Stilgoe, city engineer and surveyor, The Council House, Birmingham, the samples of Portland cement, 4 lb. in weight, to be delivered by Jan. 18. Tenders must be made out on the forms provided and delivered at the city surveyor's offices on Jan. 23, endorsed "Tender for Stores," and addressed to the city surveyor, Council House, Birmingham.

Jan. 25. MANCHESTER.—Supply of Portland cement for the Rivers Committee, required at their Davyhulme Sewage Works during the period ending June 30. Delivery will be required at the Sewage Works Wharf, Davyhulme, on the Manchester Ship Canal. Forms of tender may be obtained on application to the secretary of the Rivers Department, Town Hall, Manchester. Tenders must be enclosed in the official envelope provided expressly for the purpose (otherwise the tender will not be considered) and delivered at the above office not later than 10.30 a.m. on Jan. 25.

Jan. 25. LONDON, S.E.—Supply of the following stores and material for the Camberwell B.C., for the year ending March 31, 1909:—(c) White lead, colours in oil and dry varnishes, oils, tar, pitch, creosote, etc., glass; (e) screws, nails, bolts, nuts, and washers, wrought iron, mild steel, tool and spring steel, cast-iron foundry goods, lead pipes, sheet, etc., unions, valves, etc., W.I. gas, water, and steam tube and fittings, rain-water goods, etc., etc.; (j) flints, ragstone, hoggin, hardcore, Thames and crushed ballast, broken granite, York and other pavings, tar materials, lime, cement, and miscellaneous building materials; (k) asphalte paving work; (n) stoneware drain pipes and sewer ironwork. Forms of tender may be obtained on application to W. Oxtoby, borough engineer, Town Hall, Camberwell, S.E., by specifying sections desired. Sealed samples may be inspected at Grove Vale Depot, opposite East Dulwich Station, between 10 a.m. and 12 noon, and 1 p.m. and 4 p.m.; Saturdays, 10 a.m. to 1 p.m. No tender will be considered except on the authorised form of tender, which must be delivered at the Town Hall not later than 5.30 p.m. on January 25.

Jan. 27. LONDON, S.W.—Supply of (8) granite kerbstones and setts, (9) York paving, (10) broken Guernsey or Alderney granite, (11a) broken English granite, (12) wood blocks, (14) hogging, ballast and sand (by barge alongside Council's Wharf), (15) hogging and ballast (delivered on roads), and rubbish shoot, (24) plumber's and painter's work, (25) lime and cement, for the Metropolitan B.C. of Chelsea, for a period of one year from April 1. Printed forms of tender, and information respecting contracts, may be obtained from T. W. E. Higgens, the borough surveyor, between 10 and 12 o'clock daily at the Town Hall. Samples may be inspected at Durham Wharf, Nos. 7 and 9, Lots Road. Each tender must be enclosed in the printed envelope obtainable with the form of tender, and must be placed in the box provided for that purpose, in the office of T. Holland, Town Clerk, Town Hall, King's Road, Chelsea, S.W., not later than 5.15 o'clock in the afternoon of Jan. 27.

Jan. 27. LONDON, S.W.—Supply and execution of the following articles and works, the contract period being from April 1 next to March 31, 1910, unless otherwise described, for the Metropolitan B.C. of Chelsea:—8, Granite kerbstones and setts; 9, York paving; 10, broken Guernsey or Alderney granite; 11A, broken English granite; 12, wood blocks; 14, hogging, ballast, and sand (by barge alongside Council's wharf); 15, hoggin and ballast (delivered on roads), and rubbish shoot; 17, removal of trade refuse; 24, plumber's and painter's work; 25, lime and cement; 26, oilman's goods; 27, ironmonger's goods. Printed forms of tender, and information, may be obtained from T. W. E. Higgens, the borough surveyor, between 10 and 12 o'clock daily at the Town Hall. Samples may be inspected at Durham Wharf, 7 and 9, Lots Road. Each tender must be enclosed in the printed envelope obtainable with the form of tender, and must be placed in the box provided for that purpose in the office of T. Holland, town clerk, Town Hall, King's Road, Chelsea, S.W., not later than 5.15 o'clock in the afternoon of Jan. 27. Persons tendering should seal their tenders.

Jan. 28. TUNIS.—Supply two electric goods lifts a quantity of milling machinery, three lever balances, etc., at the Military Offices, Bizerta.

Jan. 29. WATERLOO.—Erection of a new Council school for 100 children at Waterloo. Persons desirous of tendering may see plans, specification, and conditions of contract (no quantities), and obtain other information, at the office of W. J. Taylor, county surveyor, The Castle, Winchester, between the hours of 9 a.m. and 5 p.m. (Saturdays 9 a.m. and 1 p.m.). A copy of the plan and specification will also be deposited at existing school at Waterloo. Tenders, on forms supplied by the county surveyor, and endorsed "Proposed Council School, Waterloo," are to be delivered to H. Barber, clerk of the C.C., The Castle, Winchester, not later than 10 a.m. on Jan. 29.

Feb. 1. LONDON, S.E.—Supply of the undermentioned articles for one year from March 31, for the Metropolitan B.C. of Bermondsey:—Asphalt; (S) ballast, hoggin, and sand; (S) bricks; (X) broken Guernsey granite; (S) drain pipes; (X) granite, kerb and tram; (S) granite pitchings; (S) hard wood paving blocks; (X) ironmongery; lime; paints and oils; Portland cement; (X) sewers ironwork; (X) York paving. Samples must be sent with the above marked (S), and samples of those marked (X) can be seen at the Council's offices, Town Hall, Spa Road, S.E. Forms of tender and other particulars can be obtained on application to F. Ryall, town clerk, Town Hall, Spa Road, S.E. Tenders, addressed to the Town Clerk, and endorsed "Tender for — " (as the case may be), must be delivered not later than Feb. 1.

German Art and Architecture. The current issue of the "Contemporary" contains a candid and trenchant article on "Art and the German Emperor." The article is signed "Eulenspiegel," which may be translated "Buffoon," or "Jester"; but, except for an occasional coruscation of caustic wit, there is nothing in the article to warrant so opprobrious a pen-name. The author, in fact, addresses himself very seriously to an examination of the present state of art in Germany, and his brief but pithy observations invest with fresh interest a subject that, in this country, has been, during recent years, somewhat strangely neglected—perhaps by way of reaction from the superabundance of German art that rather overwhelmed us in the early Victorian period. Recent information about German art has been almost entirely restricted to occasional records of the strange, surprising adventures of the Kaiser in that domain. It will be remembered that the Emperor's mother, an English Princess of gracious and blameless memory, was intensely artistic. The son inherits her interest; but it may be assumed that the burdens of empire do not leave him much leisure for the intensive cultivation of his undoubted taste. He has not kept pace with the movement, but this trifling fact does not prevent him from exerting his influence at every opportunity. Germany, one infers, is crowded with pictures and statues and buildings that in subject, design, and treatment show unmistakable traces of the imperial prerogative—or, as a French writer puts it, "of the intruism of jack boots and sabre in the domain of art." This interference is greatly resented and ridiculed by the Modernists, who, however, if they were amenable to it, might be all the better for it; for, says our informant, "to be strictly fair, the line of development which modern art in Germany has taken is calculated to fill the man of taste with amazement, nay, even with horror. The Germans, as a people, were never noted for their refinement of taste; but the orgies of inartistic licence revealed in the architecture, furniture designs, and sculpture of Germany are certainly an excuse for the Kaiser's *intransigeance.* No city bears the marks of the modern movement more clearly than Berlin. The wave of Græco-Roman 'stuccoco' architecture, which, to judge by the relics seen to-day, must have made the London of the 'sixties so depressing a place to live in, did not sweep over Germany to nearly the same extent as it ravaged England. From the discreet and chaste late Renaissance style of Schinkel, who flourished in Berlin at the end of the eighteenth and beginning of the nineteenth century, there was a gradual transition to the ornamental pseudo-old German house of the 'seventies. These houses are, in their turn, giving way rapidly to strange *baroque* creations, which combine in their motley heterogeneousness a dozen styles, and might have been transported out of the pages of the Yellow Book. The new blocks of flats in the residential quarters of Berlin, with their turrets and gables, their painted walls and green copper roofs, give an idea *en passant* of the struggle which is now going on between the artistic and the bizarre in modern art." The Emperor perhaps goes too far in an opposite direction. "Intelligent Germans," says the "Contemporary" critic, "who deplore the sharp antithesis between the Kaiser and the majority of German artists, admit that the licence which is now running riot and playing havoc with German art must be checked, and they welcome the Emperor's effort to enforce a healthy tone based on respect for convention." The Emperor, as we had occasion to mention a few weeks back, is inclined to be dogmatic and aggressive in architectural matters that are directly subject to his authority; but sculpture is his peculiar hobby, and he has been known to remark that if he had not been an Emperor he would have been a sculptor. Perhaps it is not very wise to allow either occupation to interfere with the other. The almost innumerable groups—battle-pieces, hunting scenes, and royal or imperial hunttives, in white marble or yellow bronze—put up under his direction, show that he knows or cares nothing for Rodin or Meunier, but prefers to be a law unto himself. As to the architecture of the country, the only comment that we care to make at the moment is that it has at least one conspicuous merit—it is distinctively German. The *baroque* style may be but a passing phase, but it has many admirers even in our own country, especially among those architects who, while attending the International Congress last year, saw so many striking manifestations of the style in Vienna. The taste of Berlin, however, is not to be compared with that of Vienna, for whereas the Viennese are artistic to the finger-tips, the Germans seem of late to have become entirely obsessed by the spirit of commercialism: from which, perhaps, the extravagances of the New Movement are an excessive rebound.

The Shakespeare Memorial Theatre. In spite of coy and diplomatic official denials, it now seems certain that the proposed memorial to Shakespeare will take the form of a national theatre. To-morrow (Thursday) there will be a meeting at the Mansion House, at which the scheme will be unfolded. Afterwards, there is to be a private meeting of the editors of the chief London and provincial newspapers, and finally a great public meeting will be called, at which all the available details will be made known. The mere magnitude of the memorial is, of course, a matter of money, depending on the response to the appeal for funds. Some indication of the requirements in this direction is useful, and accordingly Mr. William Archer and Mr. Granville Barker have produced a rough estimate of the cost. The site they have set down at £75,000; the building, with installation of scenery, costumes, etc., at £105,000. Add to these amounts a guarantee fund of £150,000, and the sum total required is £330,000. These data need not be criticised very closely, for they are purely speculative. There is, indeed, a strong, and surely not altogether unwarrantable, hope that a suitable site may be presented by the Government or some other public body—by the London County Council, perhaps, since the theatre must necessarily be placed in the heart of London. To fulfil this condition, it need not be set in the midst of the other theatres. Possibly a very appropriate place for it could be found in Blackfriars, not far from where Shakespeare and the Burbages had their famous playhouse. This was on or near the spot on which now stands Apothecaries' Hall; but, even if the exact spot were ascertainable and available, it could not be used. The theatre must be handsome and noble, and these qualities would be wasted in such a situation, unless the London, Chatham, and Dover Railway could be induced to take its blighting ugliness elsewhere. But possibly a suitable site could be found somewhere near the "Times" office—not in Playhouse Yard, which perpetuates the memory of Shakespeare's old Blackfriars Theatre, but in Queen Victoria Street, where, probably, the prosperous poet owned certain house-property. The spot is sufficiently central and accessible, and has strong sentimental claims; and there is considerable fascination in the thought that the Shakespeare memorial theatre would be the only playhouse within the City gates. We do not urge the proposal, however. The surrounding architecture is depressing enough to chill the ardour of the most courageous architect that could be chosen. The site is much more likely to be found in the vicinity of Charing Cross. That the memorial is to take the form of a theatre is indeed welcome news to the architect and builder; and it is to be devoutly hoped that the splendid opportunity of producing a building that shall be worthy of the world's greatest poet, of the city in which he worked, and of the nation that gave him birth, will not be spoiled either by lack of funds or by the maladminstration of them that might easily result from divided counsels and weak compromise. But, rather than anticipate such troubles, let us fortify ourselves with the sanguine belief that everybody will rise to this great occasion, that the right man will be selected, and that he will give us one of the noblest buildings in London.

Toledo Cathedral. Hardly had the appeal been made for funds for the erection of an English church at Madrid, when there came from Toledo the serious news that the magnificent cathedral there is in danger of collapsing. There is no reason to suppose that the danger is exaggerated, in order either to excite sympathy and attract funds, or with the meaner object of creating a momentary sensation in the cheap press; for the cathedral has been carefully inspected by a committee of architects, who have reported the urgent need of extensive repairs, and who, exercising some function or prerogative, or following some practice which we must confess we do not understand, have appealed to the Government for an immediate grant of £10,000. In this country the appeal would have to be made to the public, and the response might, or might not, be generous, but would almost certainly be tardy. Yet, in a comparatively poor country like Spain, where, however, the art sense is probably much more keen and pervasive, such an approach seems to be perfectly natural. Moreover, it is a supreme occasion; for the superb cathedral of Toledo has no rival in Spain save that of Burgos. The cathedral of Toledo dates from the thirteenth century, and is described, without very much exaggeration, as "one of the most magnificent specimens of Gothic architecture in the world," as, indeed, befits the metropolitan church of "the Gothic capital of Spain." The choir, which is in the centre of the building, comprises more than a hundred stalls of walnut wood, enriched with carvings representing scenes from sacred history, and episodes in the campaign of the Catholic sovereigns against Granada; and this work, to which there is hardly anything superior in existence, seemed to be in so much danger from the ruin that threatens the dome above it, that the church authorities deemed it advisable to order its immediate removal to the Church of the Trinity. The dome, which rises to a height of about 100ft., had become extensively cracked, and it is thought that a recent shock of earthquake has rendered its condition really perilous. If it should fall, the wonderful choir screen of marble and jasper would suffer destruction. Toledo, romantic Moorish walled city as it is, possesses nothing more interesting than its beautiful cathedral, and it is to be sincerely hoped that prompt action and efficient measures may avert the threatened calamity.

Scandalous Contract Forms. The stereotyped form of contract imposed by public authorities is iniquitous and scandalous. It may be taken for granted that, as a rule, an Official Receiver is not a creature of sentiment, and that he certainly has no bias in favour of debtors. His testimony in such conditions acquires peculiar and irresistible force. In the course of the public examination of an unfortunate debtor—a road contractor—in the Newcastle Bankruptcy Court, the other day, the Official Receiver (Mr. Thomas Gourlay) "severely criticised a form of contract which debtor had entered into with Haltwhistle Rural District Council, and said that such a contract, if it was enforced, was absolutely confiscatory, and must, in the case of small contractors, like the debtor, end in the Bankruptcy Court. It would be better for a man to be breaking stones at the roadside than working under such a contract." Counsel for the debtor naturally agreed with this denunciation. "The form of contract in this case," he said, "was the regular form adopted, and he agreed with the Official Receiver that in the case of small contractors it would be in the interests and to the benefit of the building owners to push a man into the Bankruptcy Court. The matter was a great grievance with all contractors, but they were helpless to defend themselves, inasmuch as the forms were all made out on the same lines." Our attention has been drawn to this case by the secretary of a master builders' association affiliated to the National Federation; and this fact lends point to the comment that we should have felt constrained to make upon it independently of its source—namely, that such a quasi-judicial utterance should greatly strengthen the hands of the Federation in its wise and just determination to get this iniquitous form altered. It would never have become operative if contractors had combined to oppose it. They are now in a position to smash it, and they should not spare the hammer. The case is of value and importance not only because it elicited the spontaneous condemnation by the Official Receiver, but even more because it illustrates most strikingly the scandalous injustice to which contractors are compelled to submit unless, instead of "hanging separately," they prefer to "hang together"—in such wise as to insist on a fair and reaonable consideration of their just rights. Individually, they have been powerless; corporately they can be irresistible in their demand for common fairness. In this matter of contract forms they are bound to succeed, and such a demonstration of the value of the Federation can hardly fail to secure it many fresh and enthusiastic adherents.

Books for the Architectural Student. In last week's issue we published a list of the books drawn up by a joint committee composed of members of the Board of Architectural Education and of the Board of Examiners, recommended to students preparing for the examinations of the Royal Institute of British Architects. A perusal of this lengthy list of books reveals the fact that many of them are of so expensive a nature as to be beyond the means of the average student of architecture; others, although excellent examples of their kind, are old and extremely difficult to obtain, whilst in some instances the books recommended are altogether out of date and obsolete. For example, how is the poor student, living in a remote part of the kingdom, able to obtain, for the purposes of close study, such valuable works as the following, viz., Cockerell's "Temples of Jupiter Panhellenius at Aegina," and "Apollo Epicurius at Bassae"; Gibbs' "Rules for Drawing the Several Parts of Architecture" (1732); Penrose's "Principles of Athenian Architecture"; Stuart and Revett's "Antiquities of Athens" (1762); Taylor and Cresy's "Antiquities of Rome" (1821); Berty's "La Renaissanse monumentale en France"; Campbell's "Vitruvius Britannicus" (5 volumes, 1715); Espouy's "Fragments d'Architecture de la Renaissance"; Kent's "Designs of Inigo Jones" (1727); Letarouilly's "Edifices de Rome moderne" 1840); or Sauvageot's four volumes on the Palais, Chateaux, Hotels et Maisons de France? Then, with reference to the books recommended for the study of geometry, are there not better works on "Geometrical Drawing" and "Practical Perspective" than the two volumes on these subjects which appear in the list? Finally, despite the fact that it contains much information of a general character, we doubt whether Newlands' "Carpenters' and Joiners' Assistant" can rightly be regarded as an altogether reliable text-book for students to consult in reference to an important trade in which other methods of construction have long since displaced many of those illustrated in a work published some fifty years ago. We are pleased to notice that the list of books is to be revised and amended "as occasion requires," and we do not hesitate to suggest that the one recently issued for the guidance of students should be at once superseded by another of a more useful character.

Perturbed Paris. Paris, M. Rodin has just declared, grows uglier day by day. Its architects are showing a deplorably utilitarian spirit. "They think of nothing but what the building is to be used for," he says. "When they have made a bridge that is strong enough or a hall that is high enough—little matter what is to be exhibited there: pictures, machinery, or pigs—they are satisfied. Little they care for beauty, and little have they of the sense of the beautiful. The ugliness, the brutality of their masses of stone and iron appears to them a sign of progress; to myself it seems nothing but barbarism." It is to be hoped that the new buildings are at least strong. If they are of questionable beauty, they should be at least constructed with a view to the possible consequences of extensions of the underground railways. The route of the new line for which excavations are being made between the Madeleine and the Bon Marchè may be pretty distinctly traced, according to a correspondent of the "Standard," by the line of buildings that have had to be shored up. Many of them are badly cracked; and, in particular, some of the public buildings, like the French Admiralty, are in considerable danger of being shaken to pieces either by the vibration from existing lines or by the sinking caused by further excavations. Whether the destructive vibrations are natural and at long intervals, or artificial and continuous, it is in each case necessary to devise efficient means of providing against their disastrous consequences to buildings. The ugliness may be a matter of opinion, but the cracks are indubitable, and they suggest that for the modern architect the earthquake problem has become complicated as well as urgent.

BRICK, STONE AND TIMBER.*

By H. D. Searles-Wood, F.R.I.B.A.

R.I.B.A. Brickwork Tests.

The Science Committee of the Royal Institute of British Architects carried out some experiments on the Strength of Brickwork, and the results which have been given from time to time in papers read at the Royal Institute have now been collected in book form, and can be obtained at the Institute. The bricks experimented on were London stocks, Gaults, Leicester red, Staffordshire blue, and Fletton. Single bricks, and in some cases half bricks, of each kind were tested, and also the lime mortar and Portland cement mortar; and similar bricks built in piers or walls were tested, and at the end of the book you will find a table of averages giving the rates between the crushing weight of the brick and the crushing weight of the pier or wall. The book contains all the facts connected with the experiments and illustrations of the piers and walls under pressure and after failure, so that anyone can work out for himself the different ratios that he may want in connection with his own work; and the book is a very valuable record of an interesting series of experiments. The building of the piers for series I. and II. was executed under the supervision at intervals of two members of the Science Committee, and a record of progress was kept so that the age of each pier at the time of testing could be ascertained. The piers were built by a large firm of contractors at day-work prices, and it is with regret that the Committee have to state that during the absence of the members, the bricklayers, finding the Leicester red and Staffordshire blue bricks very hard to cut, filled in a great portion of some piers with closers of London stocks. This for experimental purposes destroyed the value of these piers, and the committee were obliged to have fresh piers built, but it incidentally affords a sample of jerry work which goes on under conditions when it would appear impossible. A comparison between these faulty piers and those built under the clerk of works, affords some useful information, as it may be taken that similar scamping work occurs every day.

Standard Size of Bricks.

The subject of the standard size of bricks was taken up by the Science Committee in 1897, and a conference with representatives of the Institute of Civil Engineers and the Brickmakers' Association.

Now that the Royal Institute of British Architects has fixed the standard size of bricks, it may be of interest to say a word or two on the subject.

The standard size is:—

1. The length of the brick should be double the width, plus the thickness of one vertical joint.

2. Brickwork should measure four courses of bricks and four joints to a foot.

Joints should be ¼-in. thick, and an extra 1-16 in., making 5-16 in. for the bed joints to cover irregularities in the bricks. This gives a standard length of 9¼in. centre to centre of joints.

The bricks, laid dry, to be measured in the following manner:—

A. Eight stretchers laid square end and splay end in contact in a straight line to measure 72in.

B. Eight headers laid side by side, frog upwards, in a straight line, to measure 35in.

C. Eight bricks, the first brick frog downwards and then alternately frog to frog and back to back, to measure 21½in.

A margin of 1in. less will be allowed as to *A*, and a ½in. less as to *B* and *C*.

This is to apply to all classes of walling bricks, both machine and hand made.

This size has been arrived at after a careful consideration of long lists of different sizes of bricks from all over the United Kingdom and Ireland, and as will be seen, it is about the average size of London stocks. It is hoped that the brick users in the North will come into line, although no doubt it will take some time for the builders who have been accustomed to the larger bricks to take up this smaller size.

Fancy Sizes of Bricks.

On the other hand, many architects object to the standard of four bricks and four courses measuring 1ft., and say that, although they agree with the proportion of length to width, because that is the only way that good sectional bond can be made, the height of the four courses does not affect the question of bonding, and they would like this left open, so that those who want five courses of bricks and five joints to the foot can have them. I think that it is obvious that the standard must fix all the dimensions of a brick, and that it would be very undesirable to leave the height out of the standard, but there is no reason that I can see why architects who want the thin bricks should not have them in spite of the standard if there was sufficient demand for fancy sizes. Brickmakers would, I presume, always be willing to make them to order, and in fixing the standard we have pointed out that it applies to walling bricks only, as we thought it would be unwise to try and standardise facing bricks, at all events for the present.

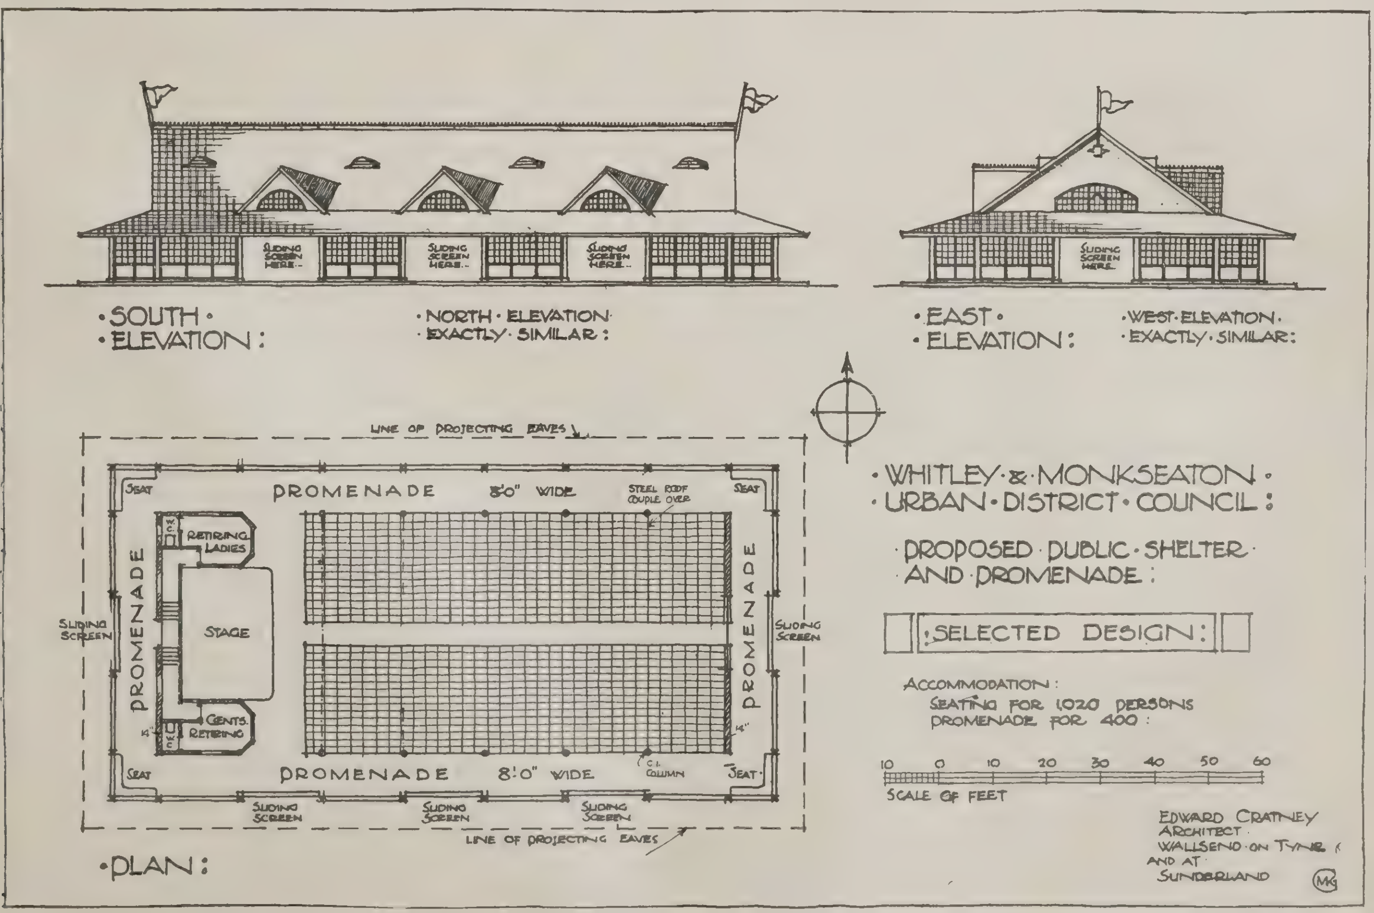
The margin in the measurements is intended to allow for the difference between the walling and ordinary facing bricks, while most builders want the full bricks that measure 9in. by 4⅜in. by 2 11-16in., with the 5-16in. bed joint, the minimum brick that measures 8⅞in. by 4 5-16in. by 2⅝in. with the ⅜in. bed joint, would suit nearly all the usual stock-sized facing bricks.

The Size of the Frog.

There is another question that will have to be settled sooner or later, and that is the size of the frog. In some of the glazed bricks the frog has been so exaggerated that a section of the brick looks like the letter H. It is obvious that the strength of the brick is seriously reduced, and when used where there is much weight, or exposed to the effects of fire, the face flies off. In order to meet this it was suggested to try a brick with three 1in. diameter holes. This would give 1 11-16in. bearing on each side, and 1½in. between the holes. These holes would be also excellent for grouting up perpends, and would help the bricklayer in cutting

---

*Part of a Paper on "Materials," read before the Architectural Association on January 8th, by Mr. H. D. Searles-Wood, F.R.I.B.A. The first part of the paper was published under the heading "Composition of Concrete and Bricks," on p. 23 of our issue of January 13th.



closers. Whether this would be open to the same objection as the perforated bricks with the smaller sized but greater number of holes I am unable to say; but these bricks are apt to fly when exposed to the effect of fire and water. The size of the frog is a serious item, also, now that so much brickwork is carried out with cement. The best form of frogs are the two square shallow sinkings; but, for brickwork in cement, bricks are often specially made without frogs.

Some few years ago Mr. Alan Munby drew up the following list of questions on building stones, and architects were invited to return the form filled up with a view to procuring a reliable reference on the subject of building stones. The following is the list that was circulated:—

Building Stones.

Strength Under Cross Strain.—Stone is a weight-carrier, with little transverse and less tensile strength. Use it, therefore, freely in compression, with caution in lintels, and never in tension. Bring pressure upon it at right angles to its natural bed, or in the case of slate to its line of cleavage.

Uses.—A careful study of stone is necessary to know what are the purposes each is best suited for. In London, Portland stone is considered the best, and other limestones, such as Bath, etc., are frequently used. The sandstones of Yorkshire and Forest of Dean are mostly used for landings and steps.

Chemical Analysis.—The value of this is the indication it gives of the lasting properties of the sample in sandstones. The nature of the cementing material which holds together the particles of silica is all-important.

Atmospheric Effects on Stone.

The sulphuric acid found in the atmosphere of large towns, the carbonic acid in the country atmosphere, will ultimately decompose any stone containing a large part of either carbonate of lime or carbonate of magnesia.

The oxygen of ordinary air will act on stone containing much iron. The average humidity of the neighbourhood in which the stone is to be used is another point, as the destructive acids penetrate more deeply into a wet than a dry stone, and the frost has a greater effect. The position of the stone also has a bearing on the question; stones that are always in the shade and never dried by the sun decay most rapidly.

Any stone exposed to very different degrees of heat on its different faces is liable to crush from unequal expansion and contraction, and for this reason stone buildings are not so fire-resisting as brick buildings, and in the tariff regulations for insurance are charged for accordingly.

Stone for Carving.

The readiness with which stone can be converted into the various shapes in which it is required for different kinds of work will depend in some cases upon its hardness, but will also be influenced by the soundness of its nature, by its freedom from flaws, and also by its natural cleavage. A soft stone of even grain and without distinct beds would naturally be selected for carved work, while a hard stone in thin layers easily separated would be well adapted for building good and economical rubble masonry.

The Hardness of Stone

is often of importance, but it does not follow that because a stone is hard it will weather well. Many hard stones are more liable to atmospheric influence than those of softer texture whose chemical composition is of more durable nature.

The Structure of Timber.

The structure of wood affords the only reliable means of distinguishing the different kinds. Colour, weight, smell, and other appearances which are often direct or indirect results of structure may be helpful in this distinction, but cannot be relied upon entirely.

Structure underlies nearly all the technical properties of timber, and furnishes an explanation why one piece differs as to these properties from another.

Structure explains why oak is heavier, stronger, and tougher than pine, why it is harder to saw and plane, and why it is much more difficult to season without injury. From its less porous structure alone it is evident that a piece of a young and healthy oak is stronger than the porous wood of an old or stunted tree, or that Georgian or long-leaf pine excels white pine in weight and strength. Keeping especially in mind the arrangement and direction of the fibres of wood, it is clear at once why knots and cross grains interfere with the strength of timber.

Hard Woods and Soft Woods.

Timber is furnished by two well-defined classes of trees: the needle-leaved naked seeded conifers (pines, cedars, etc.), and the broad-leaved trees (oak, poplar, etc.). The first are commonly called evergreens, the latter are known as deciduous trees. In the timber trade the woods of broad-leaved trees are known as "hardwoods," and the needle-leaved trees as "soft woods."

In the manner of growth both conifer and broad-leaved trees behave alike, adding each year a new layer of wood, which covers the old wood in all parts of the stem and limbs. Thus the trunk continues to grow in thickness throughout the life of the tree by additions (annual rings) which in temperate climates are, barring accidents, accurate records of the tree.

Sap-wood and Heart-wood.

Examining a smooth cross section or end face of a well-known log of Georgian pine, you can see an envelope of reddish scaly bark, a small whitish pith at the centre, and between this the wood in a great number of concentric rings. A zone of wood next to the bark one to three or more inches wide and containing thirty to fifty or more annual rings, is of lighter colour. This is the sap-wood, the inner or darker part of the log being the heart-wood. In the former many cells are active and store up starch and otherwise assist in the life processes of the tree, although only the last or outer layer of cells (the cambrium layer) forms the growing part and the true life of the tree. In the heart wood all cells are lifeless cases, and serve only the mechanical function of keeping the tree from breaking under its own great weight or from being broken by the wind. The darker colour of the heart-wood is due to infiltration of chemical substances into the cell walls, but the cavities of the cells in pine are not filled up as is sometimes believed. Sap-wood varies in width and in the number of rings which it contains. Even in different parts of the same tree, of the same year's growth, what is sap-wood in one part of a disc may be heart-wood in another. In a pine 250 years old, a layer of wood or annual ring does not change from sap-wood to heart-wood until seventy or eighty years after it is formed, while in a tree 100 years old or less it remains sap-wood only from thirty to sixty years Occupying the peripheral part of the trunk, the proportion which sap-wood forms of the entire mass of the stem is always great. Thus even in old trees of long-leaf pine the sap-wood forms about 40 per cent. of the merchantable log, while in young trees the bulk of the wood is sap-wood. Holding a well-smoothed disc ⅛in. thick towards the light, it is readily seen that pine-wood is a very porous structure. If viewed with a strong magnifier, the little tubes, especially in the spring wood of the rings, are easily seen, and their arrangement in regular, straight radial rows is apparent. Scattered through the summer wood portions of the rings, numerous irregular greyish dots (the resin ducts) disturb the uniformity and regularity of the structure. The total length of these fibres is 1-20in. to 1-5in., being smallest near the pith, and is 50 to 100 times as great as their width. They are tapered and closed in at their ends, and thin walled, with a large cavity or internal space in the spring wood; while they are thick-walled and flattened radially, with the internal space much reduced, in the summer wood. The flattening together with the thicker walls of the cells produces the greater firmness and darker colour—that is to say, there is more material in the same volume.

Medullary Rays.

The dark lines in the side of the smaller piece appear when magnified as tiers of eight to ten rows of cells lying in vertical radial planes, and are seen as bands in the radial face. These bands are the "medullary rays," and are common to all timber woods. In the pines they are quite small, but they can be readily seen even without a magnifier if a radial surface of split wood (not smooth) is examined. The entire radial face will be seen almost covered with these tiny structures, which appear as fine but conspicuous cross lines. The cells of the medullary rays are smaller and very much shorter than the wood fibres, and their long axis is at right angles to that of the fibres.

The large vertical resin-ducts are best observed on the removal of the bark from a fresh piece of white pine cut in winter, when they appear as white lines. Neither the horizontal nor the vertical resin-ducts are vessels or cells, but are openings between cells, that is, intercellular spaces in which the resin accumulates, freely oozing out when the ducts of a fresh piece of sap-wood is cut. They are present only in coniferous woods.

Broad-leaved Trees.

On a cross section of oak the same arrangement of pith and bark sap-wood and heart-wood may be seen, and the same disposition of the wood in well-defined concentric rings, but the rings are marked by lines or rows of conspicuous form or openings which occupy the greater part of the spring wood, and are, in fact, the openings through the vessels cut by the section. On the radial section the several layers appear as so many parallel stripes in the tangential face; patterns similar to those mentioned for pines are seen. But while the pattern in hard pines are marked by the darker summer wood and are composed of plain alternating stripes of darker and lighter wood. The figures on oak are due chiefly to the vessels, those of the spring wood being the most conspicuous, so that the darker shaded parts are the spring wood, the lighter parts the summer wood. Scattered through the radiating grey patches of porous wood are vessels similar to those of the spring wood, but decidedly smaller. These vessels are usually fewer and larger near the spring wood, and smaller and more numerous in the outer portion of the ring. Their number and size can be used to distinguish the oaks classed as white oaks from those classed as black and red oaks. The summer wood, except for these radial greyish patches, is dark-coloured and finer. This finer portion, divided into bodies of strands by thin patches of porous wood, and also by fine wavy concentric lines of short, thin-walled cells, consists of thick-walled fibres, and is the chief element of strength in oak wood. In good white oak it forms one-half and more of the wood; it cuts like horn, and the cut surface is shiny and of a deep chocolate-brown colour. The large medullary rays in oak are often twenty and more cells thick, and several hundred cells in height.

Discussion.

In the discussion following Mr. Searles-Wood's paper, Mr. W. H. White proposed a vote of thanks to the lecturer. He knew, he said, that the study of materials was not so fascinating as that of design, but it was nevertheless a most important part of the architect's education. A personal instance might perhaps be of some value. He had recently been consulted in regard to some plastering which had been condemned by a surveyor, who attributed the defect to bad sand. The surveyor had made no experiment whatever, but merely pronounced the sand to be of bad quality from a cursory inspection. He (Mr. White) had then conducted an experiment which proved that neither the sand nor the lime was in fault. This exposed the fallacy of condemning before examination, and the value of the ability to prove a contention by demonstration. Mr. Searles-Wood's paper gave in a concise form a vast amount of information. He advised students to get the paper in printed form.

Mr. Matt. Garbutt seconded the vote of thanks

Mr. Hampden, Mr. Pratt, and Mr. H. D. Satchell also spoke.

The President summed up the discussion and invited Mr. W. H. Wihte to give a detailed account of the experiment to which he had referred; a request with which Mr. White complied.

Mr. Searles-Wood, responding to the vote of thanks, referred to his first paper on materials, delivered at the A.A. nearly thirty ago.

Proposed New Works.

ABERGAVENNY.—The Town Hall is to be extended and improved at an estimated cost of £2,500. Mr. E. A. Johnson has prepared the plans, and an application to the L.G.B. is in hand.

AMERSHAM.—The Rural District Council has approved plans for the following:—New school, Whelpley Hill, Mr. C. H. Riley; house, Holloway Road, Chesham Bois, Messrs. Hooper and Nash; house, Austenway, Chalfont St. Peter, Messrs. Johnson and Boddy; alterations and additions, The Lawns, Pollards Wood, Mr. G. E. Nield; alterations and additions to house, Chesham Bois, Mr. F. G. Rust; two houses, Parkfield Avenue, Amersham, Mr. B. Stone, Chesham.

BIRMINGHAM.—The L.G. Board enquiry has been held into the applications of the City Council for a loan of £4,665 for the extension of the City Library, and for a loan of £3,411 for laying out a portion of the Black Patch as a recreation ground.

BLACKBURN.—The Town Council approved of the following building plans:—Hall, Dock Street, by Mr. J. Yates (conditionally); three houses, Sapphire Street, by Mr. John Riding; sludge pressing house, Eccleshill Road, by the Darwen Paper Mill Co., Ltd.; four houses, Cabin End Road, by Mr. John Smithson; 15 houses, Audley Range, by Messrs. T. Charnley and Son; new streets, Little Harwood, by the Exors. of J. F. Armistead; stable, Sandy Lane, by Messrs. T. P. Willson and Sons; two houses, Hollin Bridge Street, by Mr. W. Wilkinson; two houses, Gorse Road, by Mr. James Crank; eight houses, Eldon Street, by Mr. Hy. Thompson; and two houses, Markham Street, by Mr. L. H. Maxwell.

BRENTFORD.—The vicar of St. Paul's Church has obtained a faculty for the erection of a side chapel to that church.

BRIDLINGTON.—The town council are applying for a loan of £10,670 for the erection and equipment of new elementary schools in the Old Town Ward.

BROMLEY, KENT.—The Town Council have approved plans for the following:—Messrs. Potter and Harvey's plan of additions, Lyncroft, Cromwell Avenue; Mr. E. Hellicar's plan of house, Blenheim Road; Mr. V. Wilkins' plan of additions, Miramar, Madeira Avenue; Mr. F. G. Crickett's plan of workshop, Napier Road.

BURY ST. EDMUNDS.—The Town Council are about to convert the town hall into additional municipal offices and to carry out various other alterations from plans prepared by the Borough Engineer. The cost is estimated at about £1,500.

CARDIFF. The Schools Management Committee are looking for a site for a new school in the Canton (Riverside) district.

CARRON, SCOTLAND.—A public hall is to be erected here, and plans are being prepared.

DARLINGTON.—It is proposed to erect a number of almshouses here at a cost of £3,000. This sum is to be borrowed from the Public Works Loan Commissioners, to be repaid out of the income accruing from Buck's and other charities, which are to be diverted to this purpose by sanction of the Charity Commissioners.

EXETER.—At a cost of about £10,000, the Asylums Committee of the City Council are about to extend the City Ayslum.

GILLINGHAM, KENT.—The Town Council has approved plans for the following:—Four houses, Chatsworth Road, for Mr. Virtor Tewell, submitted by Mr. Frederick D. Pott; Sunday school, Byron Road, for the Building Committee of Wesleyan Church, submitted by Mr. G. E. Bond; Bungalow, Lidsing Road, Hempstead, for Mr. R. L. Gorf, submitted by Mr. Newnham; sixteen houses, Eva Road, for Mr. Richardson.

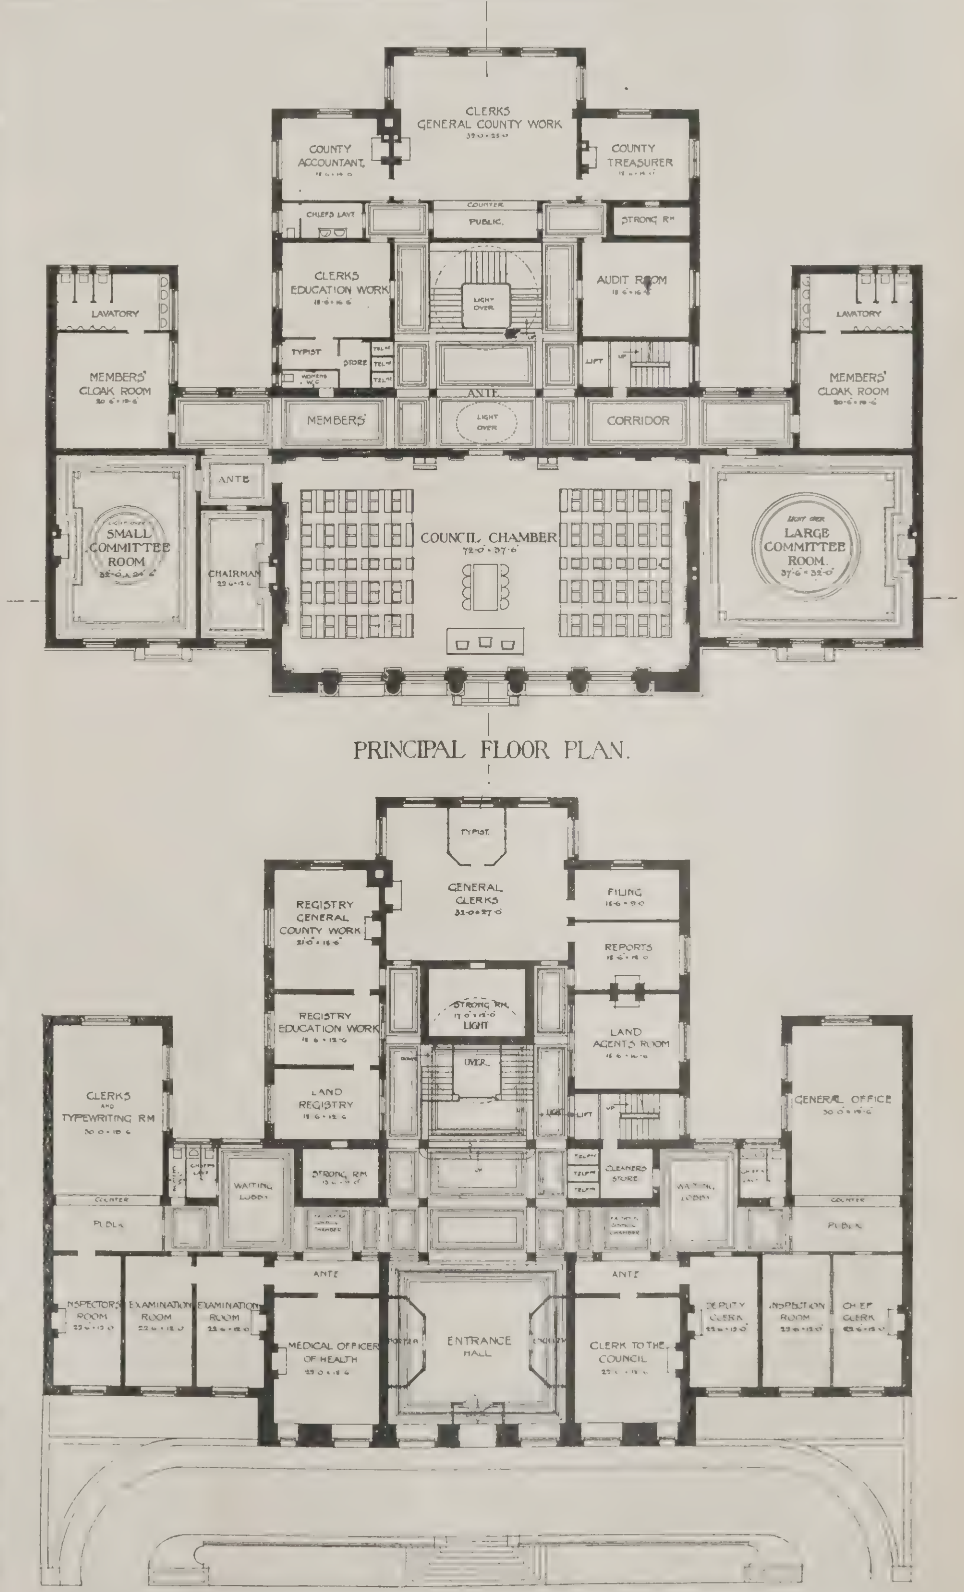
GLOUCESTER.—Plans for the extension of the Shire Hall have been passed by the Gloucestershire County Council, and the tender of Mr. J. Moyes has ben accepted for clearing the site.

HARROGATE.—The L.G. Board has held an enquiry into an application by the Corporation for a loan of £8,850 for the extension of the royal baths.

HUNTINGDON.—The Town Council has been considering the question of a possible site for a County Hall, upon which they are conferring with the County Council.

KIDSGROVE.—The girls' national school is to be rebuilt at a cost of more than £1,500.

LEICESTER.—The L.G. Board has held an enquiry with an application of the Town Council for sanction to borrow £8,500 for the extension of the Town Hall, £1,508 for the erection of firemen's cottages in Colton Street, £4,100 for the purchase of land in Newarke Street for the purposes of street improvement, and £752 for works of sewer-



DESIGN FOR A COUNTY HALL; GROUND AND PRINCIPAL FLOOR PLANS. COLIN J. MACDONALD AND J. HAROLD SAYNER, A.R.I.B.A., ARCHITECTS.

age in Norton Street and Lower Brown Street.

LONDON.—There is a new scheme in the air for erecting an immense hall, larger than Olympia, as a permanent home for the international horse show. The syndicate at the back of the scheme is looking for a site of seven acres in the West End.

LONDON: DEPTFORD, S.E.—The Borough Council has secured a site for a new branch public library in New Cross Road, nearly opposite All Saints' Church. Mr. Andrew Carnegie has promised £4,500 to defray the cost of the building.

LONDON: MUSWELL HILL, N.—The Ecclesiastical Commissioners have allocated a sum of £10,000 for the erection of a permanent church in place of the temporary one of St. Peter, Colney Hatch Lane.

LOUTH, LINCOLNSHIRE.—The Local Antiquarian Society are about to erect a museum here, the Town Council leasing the Society a site in Enginegate for this purpose.

MONIFIETH, SCOTLAND.—The Town Council are looking for a site for new municipal buildings.

POOLE.—The Town Council has approved plans for the following:—Two houses, Birchwood Road, J. Wright, per T. E. Grimes; three houses (revised plan), Junction Road, A. and F. Wilson, per W. Andrew; house, Ravine Road, E. Wilson, per T. Stevens; house, Dalketh Road, Hawker and Mitchell, for W. E. Jones and Sons; house, Ettrick Road, Smart and Wyeth, for F. King Hall; road off Salisbury Road, E. E. Clarke, for G. Parsons; house, Munster Road, T. E. Grimes, for J. Wright; roads at Sandbanks, H. F. J. Barnes, for Harbour Commissioners; cottage, No. 1, Pope's Farm, small holding, T. R. Sanders, for Lady Wimborne; two houses, Kingland Road, R. B. Eaton; pair of semi-detached houses, Kingland Road, R. Williams for Mrs. Williams; houses, Rossmore Road, S. Yeatman for T. Whitfield.

SUNDERLAND.—The Town Council is contemplating the immediate extension of the Town Hall. The scheme has been in hand a considerable time, a competition having been held as far back as 1903-4, for the extension, the successful design being that of Messrs. Wills and Anderson, of London. In this design the elevation of the present building is continued with a replica of the present tower to preserve the symmetry of the completed buildings.

SWINDON.—The Town Council have approved plans for the following:—Mr. A. J. Colborne, drainage of streets and back roads, Kingshill Estate; Mr. A. J. Colborne, 11 houses, Kent Road; Messrs. J. Hepworth and Son, Ltd., alterations, 36, Bridge Street; Mr. G. M. C. Wade, plan of additions, 25, Fleet Street.

UPPER RENFREWSHIRE.—At the meeting of the Buildings Committee of Upper Renfrewshire, intimation of the intention to erect the following buildings was given:—Double cottage in Belmont Avenue, Giffnock, for John Taylor, Eddlehurst, Larkhall; terrace of four houses in new street off Bushby Road, Giffnock, for James M'Luskie, 37, Bath Street, Glasgow; villa in Greenhill Avenue, Giffnock, for James Hill, 54, Terregles Avenue, Pollokshields; villa in Merrylea Road, Newlands, for John M'L. Dennistoun, 656, Alexandra Parade, Glasgow; and two tenements, in Dumbarton Road, Yoker, for Messrs. William M'Neill and Co., 301, Victoria Road, Glasgow.

WALLSEND.—The Town Council have approved plans for houses and shops to be built in High Street for Mr J. MacHarg.

WIMBLEDON.—The Town Council have debated the question of extending the present municipal buildings or building fresh ones. The probable respective costs of these two proposals are to be ascertained and reported.

WATERFORD, IRELAND.—A conference of authorities, including the South Tipperary County Council, the North Tipperary Council, the Kilkenny County Council, the Wexford County Council, the Waterford County Council, and the Waterford Corporation, has been held to consider the erection of the new Waterford Bridge, for which these authorities will be assessed as contributors. It was decided to employ an eminent expert engineer to suggest an alternative scheme, less costly than that proposed by the vice-regal commission.

WOKING.—A technical institute and boys' secondary school is to be erected here by the Surrey Education Committee at a cost of £21,000.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Jan. 31	*SOUTH BANK - IN - NORMANBY. Town Hall, Council Offices, etc., for the Urban District Council. Particulars of the Clerk, Town Hall South Bank, S.O., Yorks.
Mar. 17	NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3,500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council. Stanley S,O., Co. Durham.
Mar. 31	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days.
No date.	PONTARDAWE (WALES). Offices for the Guardians, in Holly Street. Premium £10 10s. The premium is offered by the Guardians "for plans with abridged specification, *which in their judgment* are best suited." Particulars and conditions from C B. Jenkins, Clerk, Herbert Chambers, Pontardawe, S.O., Glamorganshire.
No date.	BLACKBURN. The Blackburn Small Holdings and Allotments Committee have decided to invite architects and surveyors in the Borough to submit competitive plans for the laying-out of the estate at Oswaldtwistle, recently purchased for small holdings. Premiums of £25, £10, and £5 are offered.

**The R.I.B.A. Council has requested Members to refrain from competing.*

Law Case.

Crucifix on Roof Loft.—Question of Legality.

In the London Consistory Court, on Thursday last, the Chancellor of the Diocese (Dr. Tristram, K.C.) heard, and reserved his judgment in, an application which, he said, was the first of its kind that had come before him during the time that he had been Chancellor. It was made by the Rev. Walter Forster, vicar of St. Paul's, Bow Common, who appeared to support a petition praying for a faculty authorising the erection of a rood beam in his church. No one attended to oppose the application.—Dr. Tristram read the petition, from which it appeared that a vestry meeting, held in November last, had resolved to accept the offer of a rood beam to be given in memory of Ellen Jeffrey, and to apply for a faculty to erect it. The alteration proposed to be made in the church was thus described:—"To erect a beam, enriched with gold cresting, across the entrance to the chancel, with the following inscription on its base and scroll: 'O Lord God, Lamb of God, son of the Father, that takest away the sins of the world,' made out to each end with vine foliation in gold on green ground. On a central cross the figure of our Lord (Archbishop Benson's rendering), crowned and reigning on the tree, and idealised figures of the Virgin and St. John, the latter with his emblem carved in pear-wood of gilt and coloured work." The estimated cost was £272, and, in reply to the Chancellor, the vicar said that the Jeffrey family were formerly parishioners, and, when residing in the parish, attended the church.—Mr. J. R. C. Smith, an architect, stated that the crucifix would be 13ft. 10ins. high, and the figures would each be 3ft. 6ins. in height. Both the crucifix and the figures would be left in plain wood. The Chancellor said that the question of whether such a rood loft with a crucifix upon it might be erected came before Lord Penzance in the case of Clifton v. Ridsdale, and Lord Penzance made some remarks unfavourable to its erection. Those observations were appealed against to the Judicial Committee of the Privy Council. That, however, was 30 years ago. Before he gave his judgment, he would have to consider whether, after the decisions of the Court of Arches and the Judicial Committee of the Privy Council, he would be justified in granting the faculty. He would also have to consider whether he would be justified in granting a faculty in the exercise of his discretion. He would, therefore, reserve his decision, and would deliver a written judgment at a later date.

Notes and News.

A proposed University of Hong Kong, of similar constitution to the Universities of Leeds and Birmingham, is to be built at a cost of £58,000, provided that the public subscribe, within six months, the sum of £110,000 required for endowment and equipment. Mr. H. N. Mody, a leading Hong Kong broker, has made this conditional offer.

* * *

That man "has a tendency to adhere to architectural forms," a writer in a daily contemporary finds evidence in "the round huts of African savages and the wigwams of Indians." He notes, however, that all builders are not hopelessly conservative: "The gulls, for example, abandoning the flimsy seaweed structures on the beach for tree-nest building." This ornithological example of architectural development is no doubt very encouraging to the featherless biped; but one would have been grateful for a more auspicious bird than the maligned gull.

* * *

Mr. George Thomson, who, besides being an admirable painter, is a very keen chemist, has, it appears, discovered a medium which resists moisture, thus securing fugitive pigments such as white lead from the ruinous action of sulphuretted hydrogen. "Those who recently saw him demonstrate the value of his production," a daily contemporary reports, "wondered whether the Van Eycks' secret had at last been revealed—the secret which enabled them to paint with colours which remain to-day as fresh as when applied five hundred years ago."

* * *

In a couple of months, what are probably the largest covered reservoirs in the world will be opened at Honor Oak. They cover 21 acres and have a storage capacity of 56,500,000 gallons. The first operation in their construction was the making on the site of some 18,000,000 bricks, all of which have been used.

* * *

London's Fires in 1908.—In London during 1908 the Fire Brigade received 5,186 calls, including false alarms and chimney fires. The greatest number of calls received in one day was 37—on Christmas Day. Forty-four lives were lost owing to fires during the year, and 36 persons who were removed alive from burning buildings by the firemen died afterwards in hospitals and infirmaries. The greatest fire of 1908, so far as damage was concerned, broke out on August 4th, at 48, Old Bailey, in a huge building of six floors used as show rooms, offices, and stores by leather goods manufacturers, and booksellers This place was destroyed, two adjoining buildings were seriously damaged, and six other sets of premises adjoining were injured.

At Marylebone Borough Council meeting, on Thursday, Councillor E. A. Debenham, chairman of the Electric Supply Committee, moved that a loan of £8,000 be sought from the London County Council to execute works for the substitution of electric for gas lighting of 1,964 public lamps in streets where electric mains have already been laid. The motion was adopted. It was stated the annual charge for electricity supplied would be £7,350, or £600 less than the terms offered by the Gas Light and Coke Company for the supply of gas.

* * *

A deputation from owners and occupiers of property in Southampton Row waited upon the Holborn Borough Council, on Thursday, to present a petition urging opposition to proposals contained in the London County Council (General Powers) Bill allowing the latter body an extension of time for the purchase of premises in Southampton Row in connection with the suggested widening of that thoroughfare. The matter was referred to a committee.

* * *

All talk of rebuilding Messina is, according to a newspaper correspondent, premature, to say the least. He does not think that the ruins can be cleared away so as to free the ground in less than two or three years. On the other hand, it seems to be the rule that a town should always be rebuilt on the site where it was destroyed, or next door at most, owing to geographical conditions, etc. It is furthermore urged that in rebuilding the Japanese system should be adopted in those regions. Some people, however, are of opinion that to expect men to build in other than the way their fathers have built is like asking beavers to make their nests on the trees or the swifts to leave the old towers of Rome and haunt the woods and riversides.

* * *

Arrangements are being made by the National Housing Reform Council for a visit of inspection to German cities during next Easter week. The object is to obtain first-hand information on town-planning schemes, such as is likely to be useful when Mr. John Burns's Bill on the subject becomes law, and is put into operation in this country. For that reason the tour will be confined to cities like Cologne, Dusseldorf, and Frankfort, which supply some of the best German examples of town planning. Several of the leading British municipalities are expected to be represented in the party which the Housing Reform Council is organising, and assurances of hospitality are forthcoming from public bodies in Germany. The President of the Local Government Board is to be invited to join the tourists.

R.I.B.A.

PRIZES AND STUDENTSHIP AWARDS.

At the meeting on Monday the awards of the various prizes and studentships were declared as follows :—

Institute Silver Medal and 25 Guineas, for an essay on "The Influence on Architecture of Modern Methods of Construction."

1. "Void," Henry H. Hill, B.A., Bayswater, W.
2. (£10 10s.) to "Viota Nuova," Horace Cubitt, A.R.I.B.A., Strand, W.C.
3. (Hon. mention) "New Lamps for Old," J. Maclaren Ross, A.R.I.B.A., London, W.C.

Institute Silver Medal and Ten Guineas, for set of measured drawings of Ancient Buildings in the United Kingdom or abroad :—

1. "San Gallo" (6 strainers, Church of the Madonna di San Biagio, Montepulciano); Ernest W. Wray, York.
2. (Medal of Merit), "Flint" (5 strainers of Lavenham Parish Church); Alan G. Brace, Lapworth, Warwicks.

The Soane Medallion and £100 (for Continental Travel).

Subject :—Design for a Casino on the borders of a lake :—

1. "Red Seal" (device), 5 strainers; Anthony R. Barker, Harrow.
2. (Hon. mention and £21) "Centrelines," 5 strainers, Adrian Berrington, London, W.C.

The Owen Jones Studentship, Certificate and £100 (for travel and study of colour).—

One application, that of Mr. S. Herbert Maw, was received (6 strainers). The studentship was not awarded, but £21 was given to Mr. Maw in recognition of merit.

The Pugin Studentship, Silver Medal and £40 (for travel in the United Kingdom).

1. Sydney H. Miller (4 strainers).
2. (Hon. mention and £10 10s.) H. Hubert Fraser (4 strainers).

The Tite Prize: Certificate and £30 (for Travel in Italy).

Subject set :—Design (according to the Principles of Palladio, Vignola, Wren, or Chambers), for a covered arcade of shops.

1. "Clarion," 3 strainers, Richard W. N. Gunn, Glasgow.
2. (£15 15s.) "Last Man In," 3 strainers, Bertram Edwin Lisle, Wandsworth, S.W.
3. (£10 10s.) "Dezzezero," 3 strainers, S. Herbert Maw, Hull.

The Arthur Cates Prize; £42.

One application has been received—from Mr. Leslie Wilkinson (6 strainers), to whom the prize has been awarded.

Grissell Gold Medal and £10 10s.

Subject set :—Design for a landing stage to a Royal Palace from a lake :—

1. "Dies," 6 strainers, Douglas William Day, Leicester.

Godwin Bursary: Silver Medal and £65.

J. A. Allan: 5 strainers.

PUBLIC ABATTOIRS *

The Moral View.

From a humanitarian point of view it is our bounden duty to animals that they should be killed as painlessly and under the best conditions possible; it is a duty to ourselves that meat supplied for human consumption should be free from disease; that those places in which the work of slaughtering and dressing meat foods take place should be as hygienically perfect as possible; and it is an important matter of policy that by-products and other valuable materials should be utilised to their fullest extent. These essentials can only be achieved by the establishment of public abattoirs throughout the country, and by the elimination of private slaughter-houses.

Opportunities for Designs.

When the public abattoir system is established as firmly here as it is to-day on the Continent, there will be a very wide field open for the English architect to design these utilitarian but certainly complex buildings, well planned and with a distinctive character.

In England and Wales to-day we have nominally about ninety-eight public abattoirs, but nearly two-thirds of the buildings are very small, or obsolete in planning; in fact, a large number cannot be really seriously considered as public abattoirs at all. Even if they were all satisfactory this number would represent one institution to about every 330,000 inhabitants. As a matter of comparison, taking one-third of the existing abattoirs as being reasonably representative buildings, we have to-day in England and Wales one public abattoir to each million of the population. It is therefore apparent that we have hardly reached the fringe of an "abattoir system." In Paris to-day there are two splendid municipal abattoirs, supplying the meat for the whole of the city, and not a single private slaughter-house. In London alone to-day we have about 294 private slaughter-houses and not a single municipal one.

Private Slaughterhouses.

The author showed the disposition of the private slaughter-houses, licensed last year by the London County Council, in the area covered by the map published in the London Directory. There are 222 private slaughter-houses in that area, and in nearly every case they are in the midst of residential property. The fact that they should exist at all, many in populous districts and surrounded by houses, is an offence to humanity, hygiene, and economy. We pride ourselves on the enormous strides we have made in sanitary science during the last fifty years, but on this particular subject we are at least a century behind our Continental neighbours. Recently plans have been prepared for a public abattoir in Constantinople, and the work either has been or shortly will be commenced. When this has been accomplished, London will stand in "splendid" isolation by being the only European capital without such an institution.

The author enumerated the many defects inseparable from the system of scattered private slaughter-houses, and showed how they can be, and are, prevented in the public abattoir. Almost invariably on the Continent (and sometimes in England) these buildings are erected in the suburbs, and in close proximity to a railway, so that the necessity for driving animals through the streets does not exist. Diseased meat sold for food is practically unknown owing to the employment of fully qualified veterinary inspectors, who are continually on the spot while animals are being killed. Wanton cruelty is reduced to a minimum, as the municipal buildings are under the fierce light of publicity, the officials are continuously in attendance, and only trained men are engaged as slaughterers.

The Question of Finance.

Having dealt with the question of finance, and given statistics to show that public abattoirs can be made self-supporting or even profitable, the author set out the salient points to be observed in a well-planned abattoir. The existing buildings of this kind can be, broadly, divided into two classes, those on the "block system," where all the main departments are under one roof, and the "separate system," where the main buildings are separated by roads or passages. The main buildings of a moderately-sized abattoir consist of lairs for various animals, slaughter-hall, cooling-room, administrative block, superintendent's house, cold stores and chill-rooms, destructor, buildings for the preparation of by-products and offal, workmen's mess rooms, kitchen, bath, etc., and pathological room.

French and German Examples.

The author described the magnificent cattle market and abattoir of La Villete, Paris, designed by M. Janvier, and opened in 1867, and showed illustrations of the various markets, buildings, and slaughter-courts. The area is 105 acres, and about two and a half million animals are killed there per annum.

Illustrations were shown also of three typical German abattoirs, viz., those at Berlin, Leipzig, and Offenbach. Some of the Continental abattoirs are among the finest buildings erected. While Birmingham spends nearly 5s. a head for its abattoir, the little town of Offenbach in Germany, for instance, has spent £1 13s. 7d. per head of its 60,000 inhabitants.

British Abattoirs.

Turning to English abattoirs, the author considered the plan of the abattoir at the

---

*Summary of the Paper by Mr. R. Stephen Ayling (F.), read before the Royal Institute of British Architects, 18th January, 1909.

Dockyard, Chatham, most perfect, not only from the humanitarian point of view, but as regards facilities for working. The plan is the outcome of a report of the Commission appointed by the Admiralty to inquire into the question of the "humane slaughtering of animals," and the many witnesses examined were all experts engaged in those trades and professions appertaining to the subject. The main points in the report were as follows: "That animals awaiting slaughter should be spared any contact with the signs or smell of the slaughter-house; that waiting-pens should be separated from the slaughter chamber by sliding doors; that floors should be impervious and not slippery; that cattle should be slaughtered screened off from their fellows: that immediately the carcases have been bled they should be dressed in an adjoining chamber, screened off from view of animals entering the slaughter-house." These recommendations have been admirably carried out at Chatham. The buildings were designed in the Admiralty Office under the superintendence of Mr. J. Brooker Hunt

Plans, elevations, and in some cases photographs of a number of public abattoirs in England, including a unique plan suggested by the Model Abattoir Society were exhibited, and points of interest called attention to.

In Scotland to-day, out of 206 burghs, 124 of them, or nearly 61 per cent., have public abattoirs and greatly added powers for closing the private slaughter-houses. The Local Government Board of Scotland is now advocating the erection of public abattoirs in or near all towns. A radius of five miles is suggested for towns with from 6,000 to 8,000 inhabitants. Scotland is much in advance of England, and is generally approaching an "abattoir system."

The Question of Materials.

As regards materials, in the erection of these buildings wood should be used only where absolutely necessary. Stability and facilities for scrupulous cleanliness must be the keynote. The floors must be of perfectly impervious material, and white glazed brickwork or tiles largely used in the interior of the buildings, so that every trace of dirt or blood may be easily detected and removed. Throughout the buildings very light paint—preferably white—should be employed.

The question for or against public abattoirs appears to the author to be a national rather than a political one. He was strongly of opinion that a general "abattoir system" would encourage the British farmer to raise home-grown cattle, which would not only be to his pecuniary advantage, but also benefit the British consumer.

To trade opposition and vested interests the author attributed the fact that public abattoirs have not superseded private slaughter-houses in this country. Trade opposition is very strongly against the abattoir system, as under it inspection of meat would naturally be more stringent than is possible at the present time, so that diseased meat food would be condemned in a much greater proportion.

Official Architecture.

In some concluding remarks reference was made to the question of "official architecture" in connection with the subject. Abattoir buildings complying with various requirements, complex enginering work, elaborate sanitary work, considerations of humanity in stabling and slaughtering, the most efficient methods of veterinary inspection, etc., all tend to render them practically impossible to be designed by a single individual, however talented. In any large abattoir scheme the architect, engineers (constructional and municipal), medical officer of health, and veterinary surgeon should work together harmoniously.

INSTITUTE MEMBERS' CLUB.

A meeting of the Institute Members' Club will be held in the smoking room of the R.I.B.A. on Thursday, January 28th, at five o'clock p.m.

THE ABBEY MEMORIAL TO LORD SALISBURY.

The national memorial to the late Marquess of Salisbury will be placed in its position in Westminster Abbey in the early summer, probably about the end of May. A site has been selected for it just inside the west door on the left, immediately under the north-west arch, close to the statues of the Earl of Shaftesbury and Charles James Fox. The memorial is the work of Mr. Goscombe John, and it is regarded as being one of this sculptor's finest achievements. The figure of the late marquess is represented reclining, wearing the robes and insignia of the Garter, with the "George" attached to the collar. The right hand is extended on his side, and the left is on his breast holding a crucifix, on the arms of which are the symbols of the Evangelists. Attached to the cushions on which the head rests are two shields bearing the arms of Trinity House, of which the late marquess was an Elder Brother, and of the Cinque Ports, of which he was Warden. At the foot of the figure is a heraldic design representing St. George and the Dragon, with the oak leaf and two shields, bearing the Arms of Westminster College, of which the marquess was High Steward, and of Oxford University, of which he was Chancellor.

The altar tomb on which the figure will rest will be composed of polished black marble, with the sculptural and ornamental portions in bronze. On each side the altar tomb is an ornamental portico, under which stand three statuettes of ancestors of the late marquess, those on one side being Lord Burleigh, Lord High Treasurer to Queen Elizabeth, the central figure; on his right Robert Cecil, the first Earl of Salisbury; and on his left James, the second marquess, father of the late marquess. Robert Cecil holds in his hands a small model of a portion of Hatfield House, of which he was the builder.

The figures on the other side the altar tomb represent the ladies of the three ancestors:—Lady Mildred, wife of Lord Burleigh; Lady Elizabeth, wife of Robert Cecil; and Lady Frances, the mother of the late Lord Salisbury.

THE COMMISSION ON ANCIENT MONUMENTS IN WALES.

Sir John Rhys presided over the first meeting of the Royal Commission on Ancient Monuments of Wales, held in London on January 13th. Dr. H. Owen, F.S.A., who had taken part in an archæological survey in Pembrokeshire, said every ancient monument had been specially visited and every ancient camp surveyed. He considered that excavations were desirable under certain circumstances in order to ascertain the dates of monuments. At present there was no public place in the country where the surveys and other documents relating to ancient monuments were open to students and scholars. Ancient monuments had been wantonly destroyed or damaged at times, but not in recent years. Many monuments had been removed to churchyards for protection. Many people went from England to Pembrokeshire to see the ancient monuments, but more would no doubt go if the histories of the antiquities were more accessible. If photographs of antiquities were exhibited in schools, greater interest in the ancient monuments would be engendered. He did not think that many cromlechs had been removed from the country. There was a deep-rooted superstition with regard to their removal, as they were supposed to be the remains of druidical altars.

The Chairman: What is the superstitition?—That the person who removed a cromlech would lose a near relative—wife, if married—within a year, or that his crops would fail, or some other calamity happen.

Mr. George Evans, of Aberystwyth, stated that old Welsh castles are now carefully preserved, but there are still some which are used as the village hen-roost. Mr. Evans incidentally mentioned that he had walked 17,000 miles to visit historical monuments in Great Britain. The clergy of Wales were, as a rule, he said, careful custodians of the antiquities under their care, but some interesting screens had been swept away in Cardiganshire during the work of restoration, which, unfortunately, did not always mean conservation.

Mr. A. M. Palmer, who also gave evidence, expressed his opinion that the earthwork in Denbighshire known as Offa's Dyke was in reality a portion of the dyke built by King Offa.

MURAL DECORATION AT THE CENTRAL CRIMINAL COURT.

The mural paintings which Sir William Richmond, R.A., was commissioned by the Corporation of London to paint for the adornment of the Central Hall of the new Sessions House in the Old Bailey have just been completed, and the removal of the wooden staging reveals to full view three allegorical paintings, the subjects being "The Golden Age," "Roman Law," and "Spartan Law." The first of them, "The Golden Age," was finished at the time of the opening of the building by the King and Queen in 1907, during the mayoralty of Sir William Treloar. It is at the north end of the hall, and is a sylvan scene, with a company of nymphs dancing to the music of rustic pipes, typical of the golden age which was chosen to represent the ideal age when laws were not needed. "Roman Law" and "Spartan Law" are the paintings which have just been completed. They are on the east and west walls flanking "The Golden Age." That on the east represents Roman law under the king as chief magistrate. He is surrounded by the augurs and ædiles, while, seated, are the lictors with their wands of office. Behind is a temple of Ceres. On the raised stone floor are two columns with statues—one to Mars and the other to Justilia. The back ground is in the country round Rome, with the winding Tiber, and in the distance is the outline of the Tarpeian Rock. The heads of the augurs and others are portraits of celebrated men, Cicero among them. "Spartan Law," which is on the west wall, depicts Lycurgus, standing upon a shield on which are crossed spears, symbolical of peace. Behind him, in golden armour, are the kings of the various tribes, and flanking them are their councillors who record their votes by uplifted hand. Behind Lycurgus is a wooden gilt statue to Zeus, and among the figures are those of a plaintiff and a prisoner.

Our Plate.

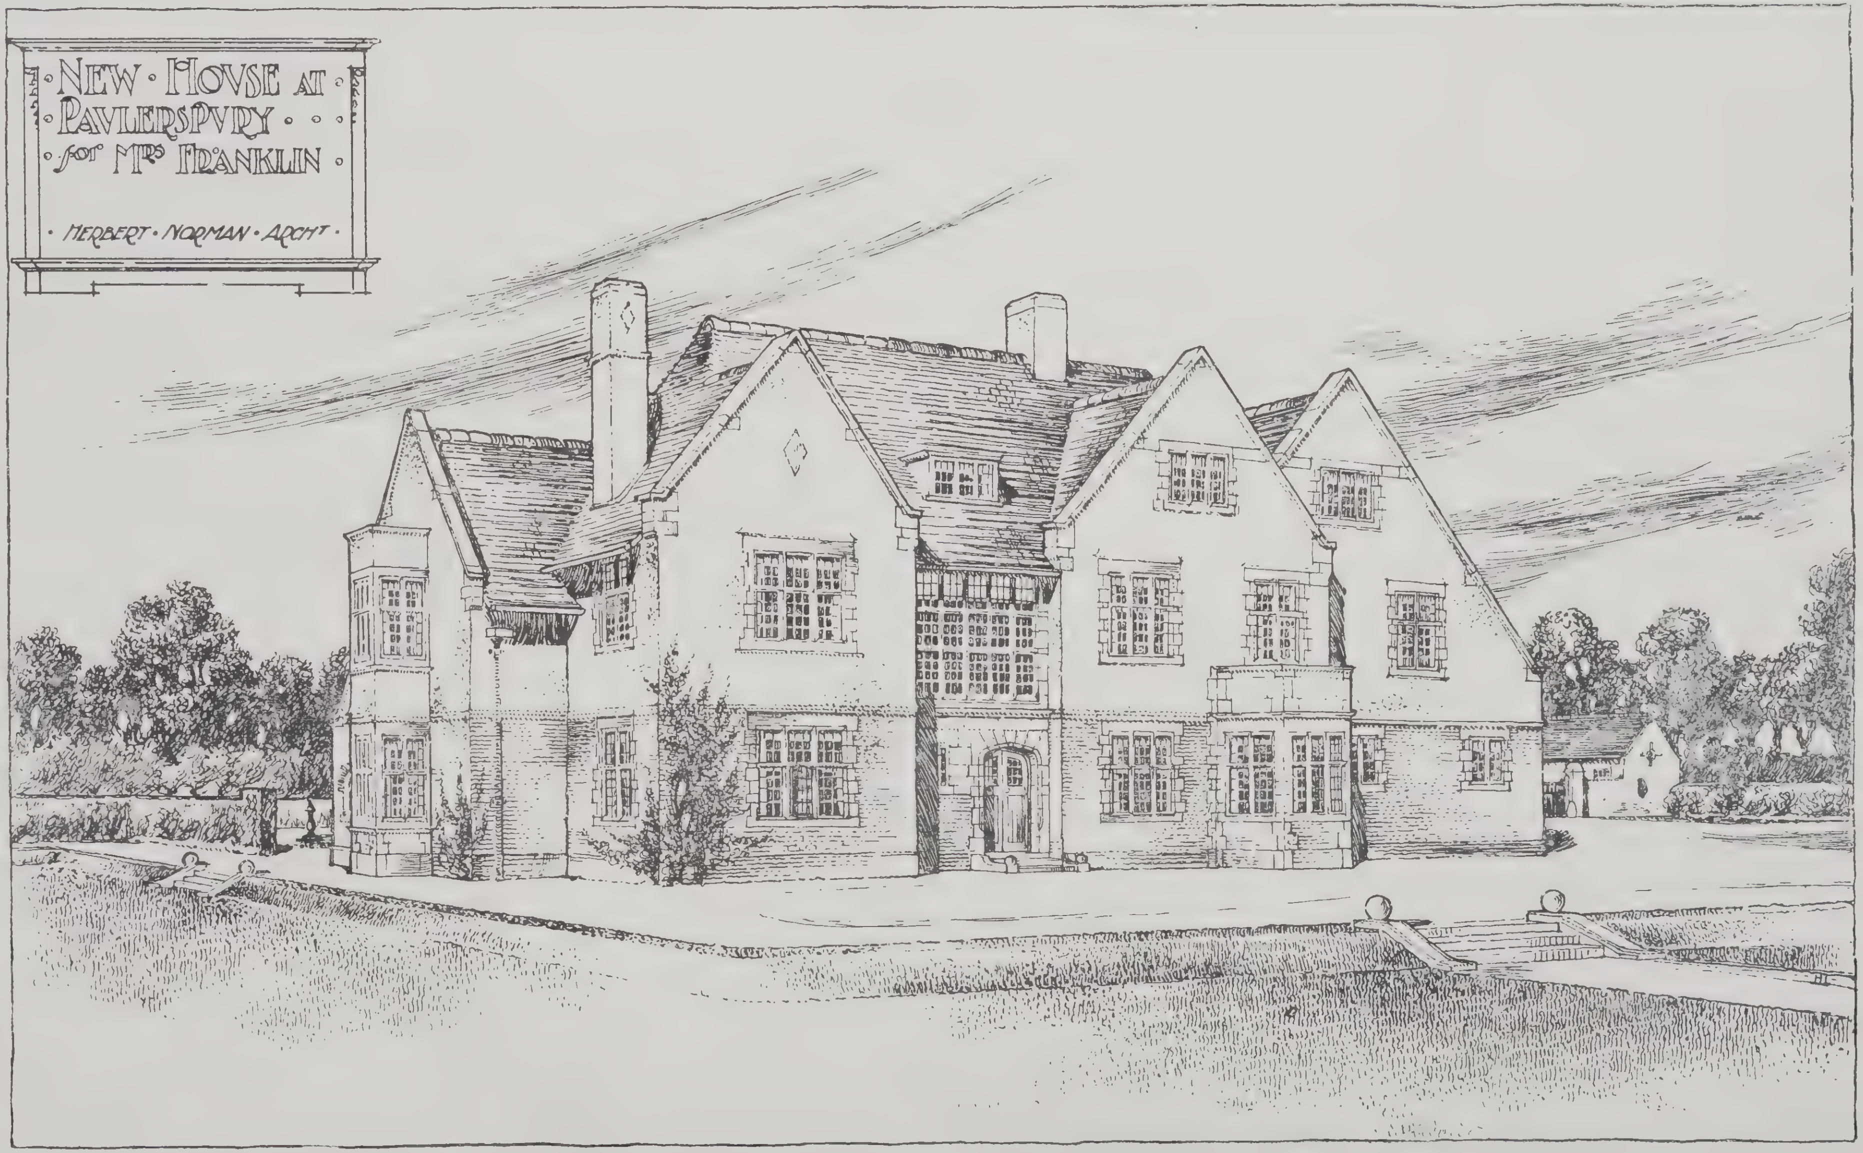
House at Paulesbury, Northants.

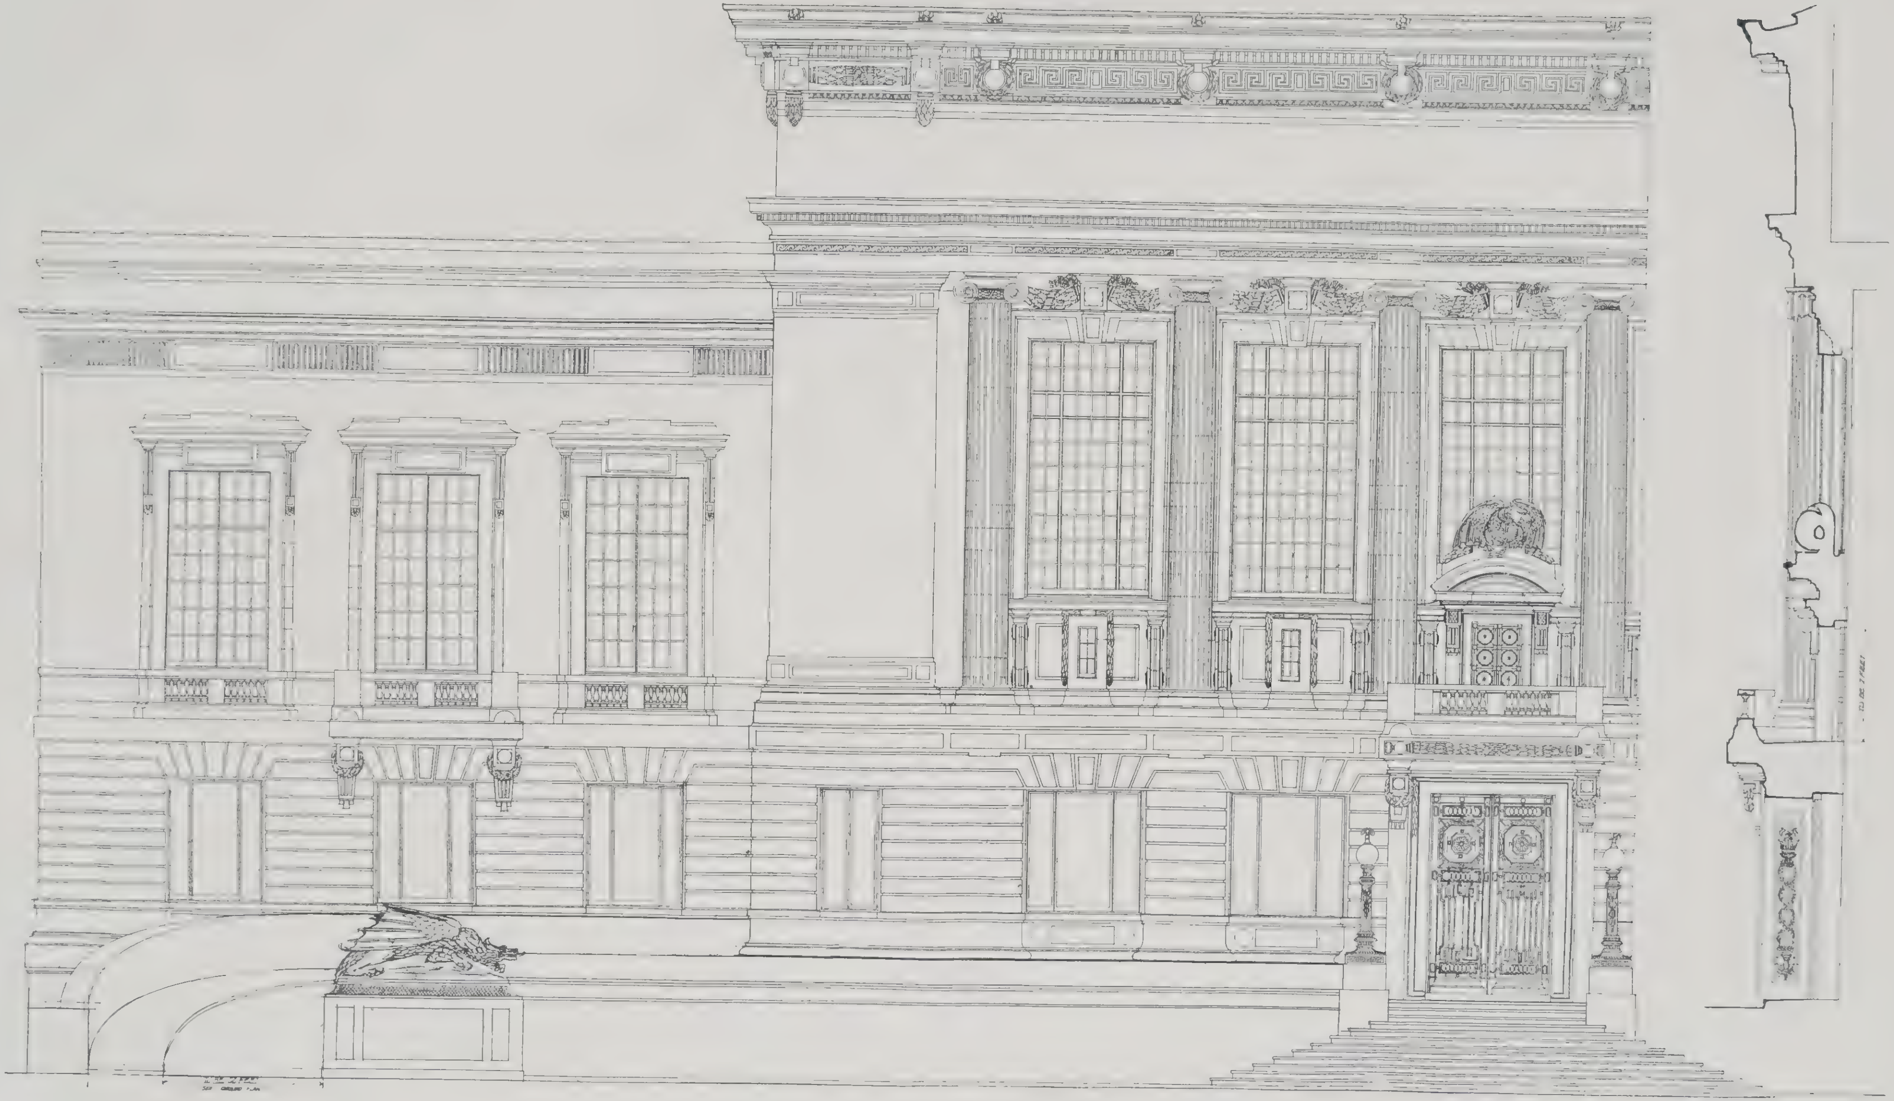
This house is to be completed early this year. It is in a fine hunting country, being within a short distance of "The Grafton Kennels," and faces the old Watling Street, along which is a continuous stream of motor traffic. Consequently the house has been well set back from the road to avoid the dust nuisance. The brickwork is of small, local building bricks, the upper part being rough-cast on hollow walls, with brindle coloured tiles on the roof. The adjoining stabling gives accommodation for ten horses. The builder is Mr. A. P. Hawtin, and the architect Mr. Herbert Norman, both of Northampton.

Design for a County Hall.

The conditions which governed this design did not present any great difficulty, but rather gave a good opportunity for simplicity in plan, and dignity in elevation. The main entrance and lift were to be on a level with the road. This difficulty was overcome by forming a sloping foot and carriage way from the extreme ends of the site. In this way the ground floor was raised about five feet—an essential point, increasing the dignity of the principal facade. The site formed part of well-wooded estate, and the main front faced a broad avenue or boulevard, where there was little traffic. These facts made it possible to have a dignified treatment of the facade, and to make the building express its purpose clearly. No light was obtainable at either side of the

Supplement to THE BUILDERS' JOURNAL AND ARCHITECTURAL ENGINEER, *Wednesday, January 20th, 1909.*





DESIGN FOR A COUNTY HALL. FART OF FRONT ELEVATION. COLIN J. MACDONALD AND J. HAROLD SAYNER, A.R.I.B.A., ARCHITECTS.

site, therefore the building was lighted from back to front, thus avoiding insanitary areas, and leaving ample space at the back for a drill ground, which was required. The council chamber was placed on the principal, or first floor. (See page 51.) The most important reason for this was, that it gave this room the required prominence, both internally and externally. It was approached from the vestibule by the grand staircase, and the facade expressed the purpose of the building in a dignified manner. An additional reason for placing the council chamber on the first floor was that of convenience. This arrangement allowed the whole of the ground floor to be devoted to those offices, frequently resorted by the public. The buildings already in existence on the adjoining sites were low, therefore the side wings were not carried up more than two thirds the height of the centre block.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

The querist's name and address must always be given, not necessarily for publication.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Models for Honours Carpentry and Joinery.

SOUTHPORT.—SIDNEY writes: "Kindly oblige with a few suggestions as to the making of the model required in the City and Guilds examination in honours carpentry and joinery. Staircasing seems to me to be rather overdone. Information as to taking out the quantities would be also esteemed."

As stair-building undoubtedly represents the highest level of technical accomplishment in joinery, it is not remarkable that stairs are usually selected for the model in this examination. As a proof of capability, the subject cannot be improved upon; but if a change is wanted, a lantern light, with lay-lights under, might be acceptable. Instruction in quantity-taking can hardly be given within the limits of an enquiry column. There are many excellent text-books on the subject.

G.

Building Line Question.

LONDON, S.W.—C.A.S. writes: "Please advise on the following particulars:—Land upon both sides of a new roadway in district thirteen miles from London (Sutton), no houses on either side of the road. Building line made by owner of land, who also made the road fixed at 35ft. If house erected more than 35ft. back, say, 100ft., will this, being the first house erected upon the land, establish a frontage line for any other houses to be erected? Solicitors advise me yes; I say no, surely not. Cannot owner of land, or purchaser of any plot, erect his house wherever he thinks fit beyond the frontage line Should solicitors (as above) view be correct, and purchaser of land insists upon his house being set back, and plans not yet passed by Council, or ever yet submitted, would it be consistent with the case and hold good if purchaser of land had built a portion of his wall and footings to so establish his frontage line, especially as it appears the owner of the land seems to be clearing a site for a house to be erected, so that he may establish a frontage line first?"

No sanitary authority could reasonably fix a building line so far back from the road as 100ft., and you need have no fear that your client will lose his rights of building upon the large area in front of his proposed new house. No doubt your solicitors refer to the powers conferred upon the sanitary authority by section 3 of the Public Health Act, 1888 (repealing section 156 of the 1875 Act): "It shall not be lawful in any urban district, without the written consent of the urban authority, to erect or bring forward any house or building in any street, or any part of such house or building, beyond the front main wall of the house or building on either side thereof in the same street, nor to build any addition to any house or building beyond the front main wall of the house or building in either side of the same." You will notice that the exercise of the powers conferred by this section is optional on the part of the sanitary authority, and not compulsory. I do not consider it is at all necessary to take the steps you suggest, but I should certainly advise you to show the vendor's building line upon the plans you deposit for the approval of the urban district council.

F. S. I.

Smoky Chimney.

LONDON.—X.Y.Z. writes: "When the fire is lighted in the dining-room, the smoke appears in the drawing-room. What remedy can you suggest?"

You do not give an elevation of the chimney stack, but no doubt the dining-room flue is in the same stack with that of the drawing-room. The cause of the phenomenon of which you speak may be (1) that a hole has been knocked out by the chimney sweep in the "withe" dividing the flues (probably at the "gathering over" near the top); or (2) it may be caused by actual downdraught causing the smoke to enter the drawing-room flue, immediately after quitting the other flue. In the first case the remedy is obvious, and in the second a chimney-pot on one flue and not on the other may remedy the nuisance.

F. S. I.

Reckoning Height of Wall.

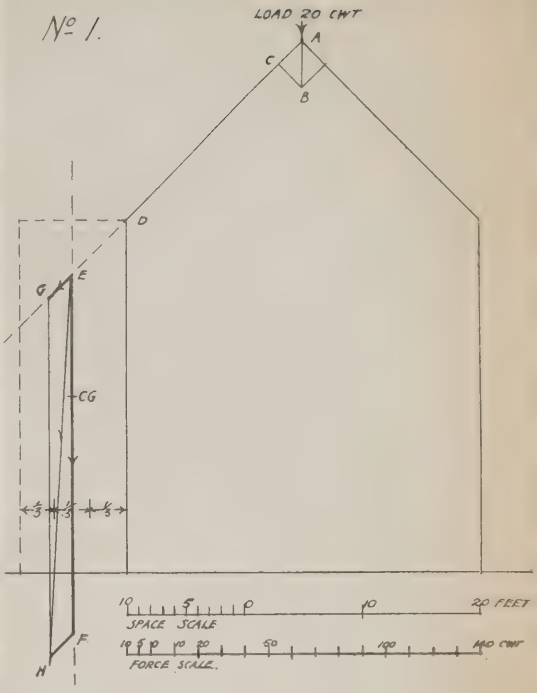
In a reply on the "Boundary Wall Problem," p. 501, in the issue of December 23rd, it is stated that the "height of such a wall is naturally reckoned from the ground line." Local authorities' building byelaws, however, generally read as follows: "The height of a wall shall be measured from the top of the footings to the highest part of the wall." This would seem to imply, from the top of the footings to the top of the coping—that is, the entire wall, exclusive of footings only, and would get over a possible difficulty where the levels of the gardens were different on the two sides of the wall.

JAS. W. GLEAVE.

R.I.B.A. Examination Questions.

LONDON, N.W.—G.B.C. writes: "The following are a few of the questions set in the construction paper, R.I.B.A. examination, November, 1908. I should be pleased if you would supply solution through your columns. Question 1.—The diagram shows two principal rafters with a single load of 20cwts. at their apex. Show graphically the thrust in each rafter, and also show how you would arrange buttresses to counteract the thrust. Question 2.—A soil-pipe is connected with a manhole, which has a cover at ground level, measuring 2ft. by 1ft. 6ins. If the outlet from the manhole be stopped and the soil-pipe be filled with water to a height of 15ft. above the ground, what will be the total pressure upon the manhole cover? Question. 3.—It is desired to overthrow a granite rectangular monolith 20ft. high by 3ft. square on plans, by means of a rope secured to its extreme top. The rope can be attached to a winch 40ft. away from the monolith and on a level with its base. What pull must the winch exert?"

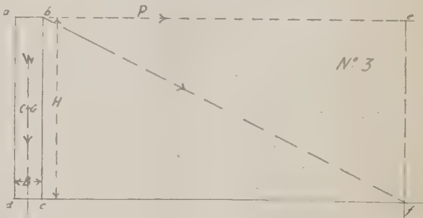
Answer 1.—Set up roof and abutments to scale, and, adopting a convenient force scale, set out A B equal to 20cwt. Draw B C parallel to pitch of roof; then A C represents thrust in each rafter to same scale. To determine graphically dimensions of buttress to resist thrust, produce direction of thrust indefinitely through D E G; assume a projection for buttress, draw perpendicular through centre of gravity of buttress assumed. From intersection of line of pressure of thrust with this assumed line of pressure of weight of buttress, set out E G equal to force of thrust, and draw E H, passing through base of buttress within middle third. From G drop perpendicular intersecting E H in H; complete the parallelogram; then E F represents weight of buttress in cwts. to same scale as other forces. Taking weight of brickwork at 112lbs. per cub. ft. we have no difficulty in arriving at remaining dimension (i.e., width) of buttress. In the diagram as drawn, this will be found absurdly narrow, as the projection has been assumed unnecessarily great in order to render the diagram compact for reproduction. The same method can, however, be applied to any case.



Answer 2.—The pressure on any surface of a closed vessel is that of a column of water with a base equal to the surface pressed, and a height equal to the head of water above the level at which pressure takes effect. In this case a column of water 15ft. high, with a base 2ft. by 1ft. 6ins., exercises a pressure equal to:—

$15 \times 2 \times 1\frac{1}{2} \times 62\frac{1}{2}$ lbs. $= 2812\frac{1}{2}$ lbs. pressure on manhole cover,

Answer 3.—When $W \times \frac{B}{2} = P \times H$ the monolith will be on the verge of movement.



$$\therefore \frac{W \times \frac{B}{2}}{H} = \text{P horizontal} =$$

cub. ft. lbs. per cub. ft.

$$\frac{180 \times 164 \times 3}{2 \times 20} = 2214 \text{ lbs. horizontal.}$$

To arrive at the diagonal equivalent (without the use of trigonometry), since the required result is represented by the hypotenuse of a right angled triangle, of which the proportions of the remaining sides, and the value of one of them are known:—

$\sqrt{2214^2 + 1107^2} = 2475.32$ lbs. inclined.

As soon as the pull exercised by the winch exceeds this, movement will commence. G.

Finishing Pitch Pine.

BANGOR.—T.A. writes: "Certain pitch-pine work is to have two coats of bright varnish and one coat of flat varnish. Will the latter get dirtier quicker than if the work were finished with bright varnish? Also, will it be less durable?"

The flat varnish would certainly retain the dirt more than the bright varnish, from the surface of which it could be wiped off. The durability of flat varnishes is by no means equal to that of ordinary gloss varnishes. Pitch-pine is not usually stained, but is given three to four coats of varnish, this number being necessary because the first coats sink in. To prevent this, two coats of sizing are often given, and then one or two coats of bright varnish will give a good job. There is a speciality on the market known as "proof priming varnish," made by Messrs. Smith and Rodgers, of Glasgow, which can be used instead of size as a first coat, and upon this a single coat of ordinary gloss varnish shows up splendidly. If desired, a coat of flat could be given over this.

J.

Responsibility for Fallen Fence.

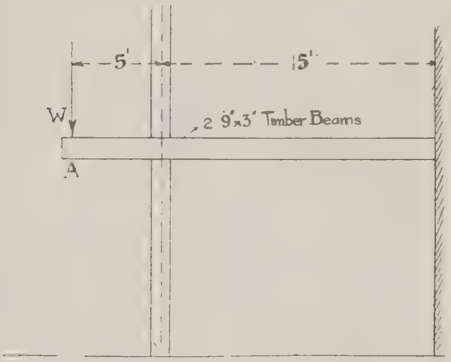
Essex.—G.B. writes: "The fence dividing the gardens at the back of two houses was blown down last March, and I have written to the adjoining landlord several times, but am unable to get him to rectify same. Can I bring any pressure on my own landlord?"

You have, of course, no claim upon the adjoining landowner (to whom, I conclude, the wall belongs), except that you have the right to remove so much of his debris as forms a trespass upon your garden, doing as little damage as possible in the removal, and not taking the materials into your own possession. As the wall is not his property, I fear you have also no claim upon your own landlord, even if you have repairing clauses in your lease calling for anv repairs upon his part to be performed. You may, however, strongly represent to him the inconvenience which you suffer, and get him to take up the matter with the neighbouring owner.

F. S. I.

Timber Cantilever.

Neasden.—"Country" writes: "What weight are the ends A of the two 9in. by 3in. timber beams, supported as shown in sketch, capable of carrying?"



If the safe load is W cwt., the maximum bending moment in inch cwt. will be $W \times 5 \times 12 = 60\ W$.

The section-modulus of each beam is $\frac{bd^2}{6} = \frac{3 \times 9 \times 9}{6} = 40.5$ inch units.

$\therefore$ Total section-modulus $= Z = 2 \times 40.5$ units $= 81$.

Taking the safe transverse stress as 10 cwt. per sq in., we have:—

Moment of resistance = stress × modulus.
$= 10 \times 81 = 810$ inch cwt.

$\therefore 60\ W = 810.$

$\therefore W = \frac{810}{60} = 13.5$ cwt.

Therefore, 13.5 cwt. is the safe load that the ends A of the beams are capable of carrying.

A.

Domestic Architecture of the Fifteenth and Sixteenth Centuries.

Rugby.—Ashby writes: "Please give the names of books dealing with architecture in the fifteenth and sixteenth centuries, as applied principally to country houses and manors."

Mr. B. T. Batsford, architectural publisher and bookseller, 94, High Holborn, kindly states that the best books he can recommend are as follows:—"Domestic Architecture of England during the Tudor Period," illustrated in a series of photographs and measured drawings of country mansions, manor houses, and smaller buildings, accompanied by historical and descriptive text, by Thomas Garner and Arthur Stratton; in three parts, price £2 2s. net per part; "Architecture of the Renaissance in England," illustrated by a series of views and details from buildings erected between the years 1560 and 1635, with historical and critical text, by J. Alfred Gotch, F.S.A., F.R.I.B.A., £7 7s. net; "Early Renaissance Architecture in England," an historical and descriptive account of the development of the Tudor Elizabethan, and Jacobean Periods, 1500-1625, by J. Alfred Gotch, 21s. net; four books (each 21s. net) on the "Old Cottages and Farmhouses" in various counties, would also shed considerable light on the subject. All these volumes can be obtained from Mr. Batsford.

Correction of Stress Diagram.

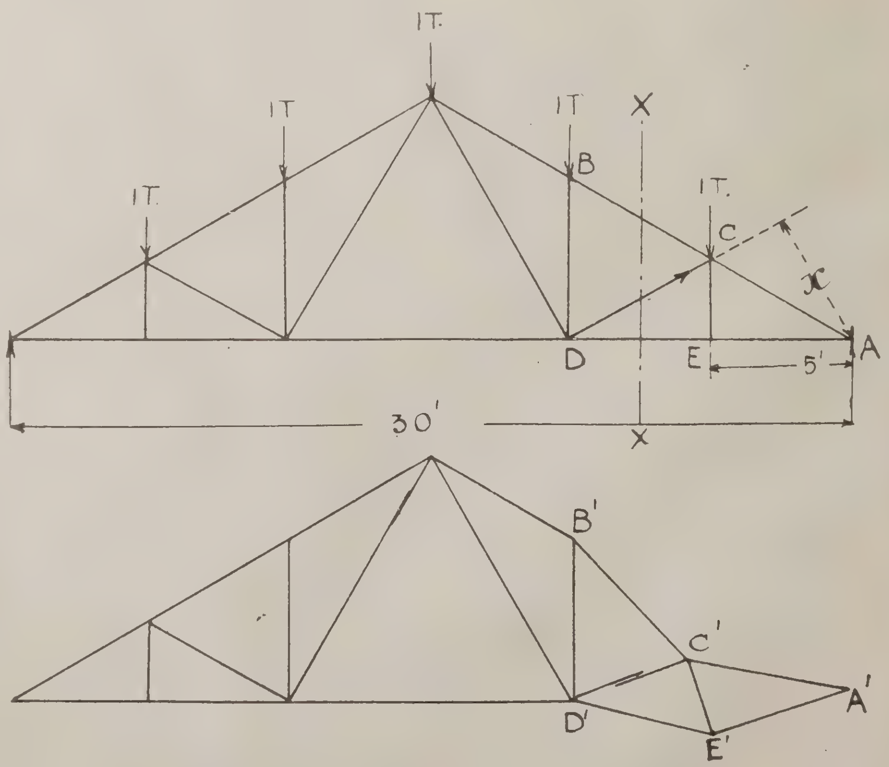
Glasgow.—T. McG. writes: "Referring to Inquiries Answered, p. 415, in your issue for November 25th, I observe an error has been made in the reply to O. J. D. The member D C is a strut under the given conditions, and not a tie, because although the cut tends to open, the effect of the member on the joints at either end of it is to push them outwards, and it is well known that when the forces in any member act 'towards' the joints, the member is in compression, and when they act 'away' from the joints the member is in tension. The truss given is mentioned as a 'somewhat usual' one, but the member C E is not usually put in, as the only stress in it is due to the portion of the weight of main tie D A, which it prevents from sagging, and in reality it is a mere suspender. The length D A is only 10ft., so that it is quite unnecessary. I think the reply on the whole is rather misleading, and would suggest the following method of finding the nature of the stress in the members. Taking D C as example. First, a section line is chosen, which cuts through this member and generally not more than two others, then the turning point A is taken at the point of intersection of the two latter members in this case B C and D E, as by this means the moments of the forces in these two members become zero, leaving only the unknown force in D C to be determined, whose normal distance from the fulcrum is known; in this case $Ax = 5$ ft. We have now only the force of 1 ton acting at C with a leverage of $\frac{30}{6} = 5$ft., and the stress in $D\ E =$ say, x, with a leverage of $Ax = 5$ ft., so that the stress in $DE = x = \frac{1 \times 5}{5} = 1$ ton. The moment of the force C is negative there, to balance this the moment of the force x must be positive, and its direction, therefore, is upwards at the upper end of member D C, showing that the member is a strut. If the moment of the force in D C had been negative, then its direction would be downwards at the upper end of the member, and, therefore, it would be a tie, or, in other words, when the direction of the force in the member considered acts towards the joint, the member is in compression, and when the direction of the force acts away from the joint, the member is in tension. Perhaps the foregoing will assist in clearing up O. J. D.'s difficulty."

There is, as two of your correspondents point out, a curious error in my reply on "Ascertaining stresses in roof trusses," in the issue named, which error I regret, and hasten to set aright. In endeavouring to explain by a very simple rule the method of distinguishing between ties and struts in the method of moments, I, by an oversight in making an incorrect drawing, stated that the bar D C is a tie, whereas it should be a strut. The present figure shows how the relative deformation should have been shown, from which it is clear that D C is a strut.

The simple method which I gave was not fallacious, but the drawing that I made somewhat too hurriedly was incorrect. If the left-hand portion be considered fixed, and the bar D C be cut through, the end A will tend to rise relatively to the rest of the truss, as the force at A is upwards, thus obtaining the relative deformation shown.

The ordinary method, which I thought would be less clear to your correspondent, is as follows: Take any section such as x x across three bars; to get this stress in one bar, say, D C, take moments round the point A where the other two bars meet. If this moment is counter-clockwise, as in the present case, the moment of the force in the bar D C will be clockwise and vice-versa. If the force in the bar acts towards the node C, as in the present case, the bar is a strut; if away, it is a tie. A printer's error in my reply has led to some comment; the reply states that the stress is "somewhat usual," whereas "somewhat unusual" was intended.

A.



ILLUSTRATING "CORRECTION OF STRESS DIAGRAM."

FIRE-RESISTING CONSTRUCTION SECTION.

(MONTHLY.)

FIRES IN 1908.

The year 1908 has afforded further evidence of the good effect of the fire protective policy that has been practised and developed during the last decade.

What with the London Building Act and other protective enactments that have been applied during that decade, and the remarkable improvement of everything relating to the organisation and management of the London Fire Brigade during the latter half of the period in question, not only is the number of fires in the Metropolis decreasing, but their character is becoming extremely mild, and it is quite an exception to meet with a really serious outbreak within the county area.

To a minor degree this also holds good in the provinces. Model by-laws, factory inspection, and insurance requirements have all gone to reduce the number of fires and the seriousness of their character, whilst there has also been a marked improvement in certain districts in the provincial fire services, especially where the fire brigades enjoy the influence of the National Fire Brigades Union.

Economically, this is a matter of congratulation for the United Kingdom; for, whilst we have been losing trade in many directions, whilst the value of property has materially decreased, and the prosperity of the country generally has suffered a set-back, there is at least one point in which the wastage in national possessions has not been so severe as it used to be, and that has been in the direction of annual fire loss. Whilst some ten years ago property to the value of some seventeen millions sterling was wasted by fire, the value of the property lost both last year and in 1907 was several millions sterling lower, and this in spite of the fact that there has naturally been an increase in the number of buildings during the decade, and thus also, in a certain sense, an increase in the number of possible fire risks.

Generally the ordinary householder has, however, scarcely felt this difference, except perhaps in the direction of his rates, which would have been higher if more money had been required for poor-law purposes to meet the demands so frequently brought upon the Guardians when a fire has turned a large number of people out of work. Only in a few directions has the householder, inasmuch as he may have been an occupier of shop or warehouse property, felt the improvement, and this in the direction of his reduced insurance rates; for a large number of the intelligent insurance officials have been, during the last few years, systematically organising non-tariff offices, seeing quite clearly that there is a very excellent profit to be made in well-organised insurance businesses which, quite rightly and fairly, take risks at a lower rate of premium than is generally charged by the so-called "tariff offices." This new competition in insurance business, combined with the lower losses and loss ratios in Great Britain, has helped to bring down some of the insurance charges, and, in fact, helped to reduce the cost of fire insurance throughout the kingdom. The cost of fire insurance in the kingdom could, however, be much less were it not for the fact that the British insurer has practically to pay for the negligence of the foreigner.

It is the fires of the United States in particular, and fires of other distant countries, that swell the insurance loss incurred by British companies; and, to put it quite plainly, it is to meet these foreign losses that the British insurance rates have to be kept at their present high level. One need only turn to the public records of any office doing British business only, or to the private records of those companies doing both British and foreign business, to see what a regrettable proportion of the British insurance premiums is absorbed in payments for fire losses outside Great Britain.

The more this becomes generally recognised, the more urgent will be the demand for new insurance companies taking the British risks only; and if these new companies would only carefully discriminate between the hazards of the different fire risks, and take special note of the important developments of late years in building construction, there is no doubt that the cost of British insurance would be materially reduced. One fact is remarkable in this direction, i.e., that none of the great fire managers of any of the older concerns has as yet had the courage to break away from the tariff association, for with the power and funds that an old company wields, and with the confidence it generally enjoys, business might well be done to a large scale on really modern lines. We think that such a development, however, is now a matter quite of the near future. One company in particular, which was noted for its amalgamation with a non-tariff office, may some day be seen as a great non-tariff institution, perhaps even as the *doyen* of a non-tariff alliance.

This insurance question is of great importance to architects and builders; for the client is daily asking why he should put in better construction into his building if he gets no substantial insurance advantage. As a matter of fact, the architect who knows his work in this direction can occasionally obtain advantages for his client; but as a general rule this is not the case, for but few architects are conversant with our insurance tariffs and conditions.

Turning now to the fire losses of the year we will again, as in previous years, refer to our contemporary the "Post Magazine," which gives its usual excellent annual record of notable fires, and on this occasion has also given some interesting facts as to the electrical fire hazards, as to the work of the Fire Prevention Committee, and the question of municipal fire insurance.

Notable Fires.

This insurance authority suggests, in effect, that the loss ratio for 1908 may be expected to be below the average as far as Great Britain is concerned.

The most serious fires of the year have been at some shoe factories in the North, of which that of Messrs. Roberts and Sons, at Leicester, was perhaps the most notable among the fires in boot factories.

The largest brewery fire appears to be that at Ipswich, which involved a loss of some £67,000.

There has been quite a large number of country-house fires, due mainly to negligence, and to the entire absence of rapid means of fire extinguishing. Notable among the fires involving losses over £10,000 was one at Scorrier, Cornwall; at Hazelwood, Herts; Monzie Castle, Perthshire (£20,000); Islay, Argyllshire; at Douglas Support, Lanarkshire (£21,000); at Normanhurst, Sussex; at Burley Hall, Rutlandshire (£44,000). These losses are of historical as well as of financial interest.

Turning to places of workship, our contemporary says that there have only been a few fires in churches.

Of theatre fires, the most notable one was that of the Drury Lane stage, which, as reported on in our Journal, involved a loss of £12,500, rather a different figure from the exaggerated ones that found their way into the daily press.

Of cotton mills there was a loss of £30,000 at Ashton-under-Lyne, and there were large fire losses at Preston, Stockport, and elsewhere.

The most notable warehouse fire occurred in London—that at the Old Bailey, involving a loss of £70,000; and one at Skipton, Yorkshire, involved a loss of £42,000.

There has been a decrease in fires in timber yards, tanneries, and the like.

There have been no great fires that have any resemblance to conflagrations in this country. In fact, the majority of fires recorded have been of quite a "one building" character, owing to the better construction of the buildings and hemming in of the area of the fire by the fire service.

If the position in Great Britain has been satisfactory, it is interesting to observe that our contemporary holds that the fire loss in the United States for 1908 is some five millions sterling above its already enormous annual average.

The fire at the City of Chelsea, near Boston, covering an area of some 275 acres, involved a loss of 2½ million sterling. A fire at New Orleans must have have cost some £300,000. A single warehouse at Kenora cost some £200,000. But it would be going too far to enter into detail. The examples cited, however, sufficiently emphasise the extraordinary loss incurred in the American Continent, and we must again express regret that so much of these losses should have to be paid for out of the pockets of the British householder.

When we consider our own Colonies, it is seen that the losses have been high, but not perhaps exceptionally so. The Australasian and the New Zealand losses, however, rank badly in the loss ratio. Christchurch, New Zealand, had a loss of half a million sterling. This is not as it should be.

Of continental fires, the most notable was that of the Paris Telephone Exchange, which was fully reported in this Journal. The loss in this one building may be estimated at one million sterling, if we take into account the enormous indirect loss involved by the building of this structure.

It is to be hoped that Great Britain will continue to lead the way in its fire protective policy, and systematically to reduce its fire loss, and that it will eventually serve as an example in this direction, not only to the Colonies, but also to some of the foreign countries.

FIRE PREVENTION IN 1908.

The British Fire Prevention Committee's Work for the Year.

The work of the British Fire Prevention Committee has been continued, if anything, more actively than in previous years, and their latest series of tests with various forms of doors and roller shutters form a very important contribution towards the technical knowledge of fire prevention.

A new departure in the committee's work during the year has been its extensive series of tests with extinguishing appliances, both proprietary and non-proprietary. The committee have dealt with the ordinary bucket and hand pump, which are both most useful for small fires, the ordinary cloth and sand for petrol fires, as also a varied assortment of patented extinguishers of different sizes, ranging from the capacity of one gallon to 125 gallons.

There is no doubt that there is a great demand at the present moment for first-aid fire-extinguishing appliances, and architects are constantly being called upon to specify them in connection with the equipment of their buildings. The work thus undertaken by the committee in this direction should also be a useful contribution to the subject, and it is to be hoped that all the various forms of appliances will eventually be examined and reported on. There is unfortunately much at present on the market in the form of fire-extinguishing powders, etc., which cannot claim the users' confidence.

The committee's work has been enjoying an even greater favour than heretofore from public authorities; and public departments, such as the Admiralty, War Office, H.M. Office of Works, are now on the committee's subscribers' list; whilst members of the Council, such as Sir Henry Tanner, I.S.O., Sir James Williamson, C.B., Mr. Riley, F.R.I.B.A., and others have been showing considerable activity in attending the Regent's Park tests, and interesting themselves in the committee's work.

The executive work of the year has been in the hands of Mr. Edwin O. Sachs and Mr. Ellis Marsland, and a very considerable amount of the testing work has been under the direction of Mr. Max Clarke, F.R.I.B.A., Mr. Percy Collins, J.P., and Mr. J. H. Dyer.

A serious loss has been sustained by the committee during the year by the death of Mr. James Sheppard, to whose work we have referred fully in our

LESSONS LEARNT

Doors.

Of lessons learnt from the committee and directly applied during the current year, we would mention, in the first place, the confidence created in roller-shutter doors. The pioneer door on the British market was the Gibson door, which has since been followed by the Wilson door, both of American origin, and now about to be manufactured in Great Britain. They will meet the new demand for larger openings in the party walls between buildings and in divisional walls.

The older forms of sliding door or hinge doors have been found to be unsatisfactory for openings over 10 ft., on account of their weight, the space they occupy, and the general cumbrous character of their gearing.

To be able to close the opening effectively, and yet be able to stow away the door overhead when the opening is in use, has been a requirement of practically every shopkeeper, and also of many manufacturers.

A weak spot of the roller-shutter door is that the door when closed is no longer easily opened for purposes of rapid exit. But this, we understand, is being overcome by placing a small door alongside, and giving it the ordinary hinged door as an exit door. The advent of the roller-shutter door means much for London buildings, and for the shopkeepers in particular, and it has been anticipated that they will soon find general adaptation, specially now that the London Building Act gives power to the Council to allow this form of door, and the Council on its part has satisfied itself, through the tests of the British Fire Prevention Committee, how very efficient this type of door can be. The permission accorded for the use of the roller-shutter door is a step towards its general introduction in the Metropolis, and it has been technically one of the features of the year, and this feature has been practically entirely due to the work of the British Fire Prevention Committee.

Fire Extinguishing Appliances.

Another lesson which, as indicated above, claims attention is that of the use of simple means for first-aid fire extinction. The committee have most clearly demonstrated the value of the ordinary household bucket, the hand pump, and the asbestos cloth, and, having regard to their comparative low cost, it is to be hoped that these every-day appliances will find greater application than heretofore, in both domestic and public buildings.

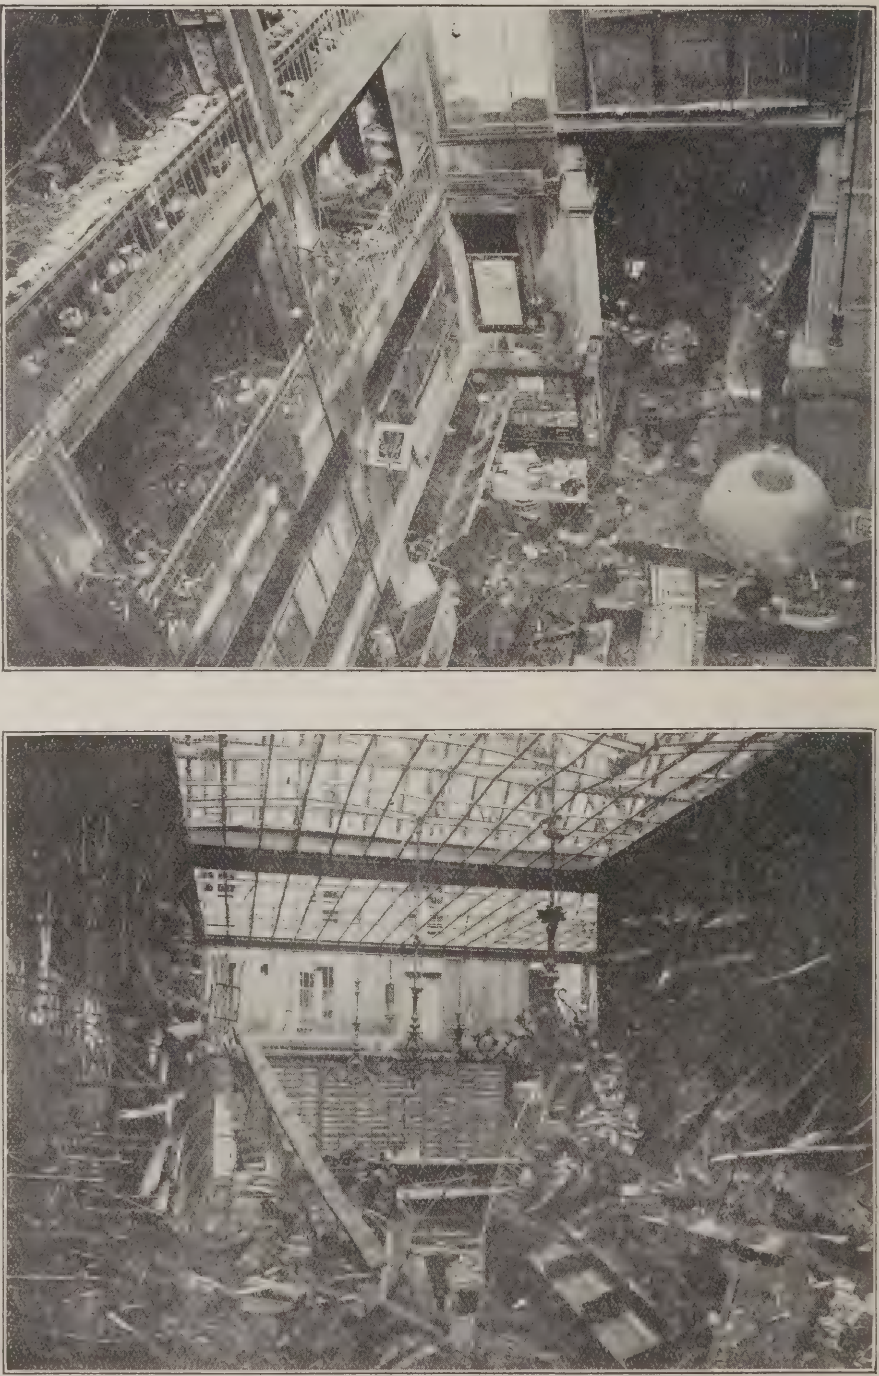
It is not always essential to spend large sums on chemical extinguishers or the like. Anyone comparing the reports of the British Fire Prevention Committee will soon realise how much efficiency can be obtained from first-aid appliances, and that the more expensive appliance does not necessarily mean the more efficient one; in fact, quite the reverse.

It is public property that at recent tests a few buckets of water have been shown to do in the extinction of ordinary small fires what a number of powder extinguishers failed to do. As a bucket costs about 2s. 6d., and the powder extinguishers are listed at 10s. each, the ratio of cost is not very encouraging to manufacturers of "powder"-appliances.

Future Work of the Committee.

We understand that the committee is now occupied with the important work of assembling the data obtained at its tests, with a view to issuing them in tabular form, and should this work be accomplished during the coming year, another step in the right direction will have been taken by the committee.

Speaking of the membership and subscription list of the committee, it is pleasing to observe that not only are our own Government Departments taking an interest in its work, but those of our distant Colonies are also now co-operating with the committee. Further colonial sections of members are being formed, the first of which is in New Zealand, which boasts of some 25 members. It would indeed be valuable if the committee became not merely British in the ordinary sense, but Imperial, in its influence.



ST. DENIS DRAPERY STORE FIRE, PARIS. GENERAL VIEW OF CENTRAL COVERED COURTS.

Of tests advised for the coming year, we understand there will be some further series of door and shutter tests, and also with reinforced concrete floors.

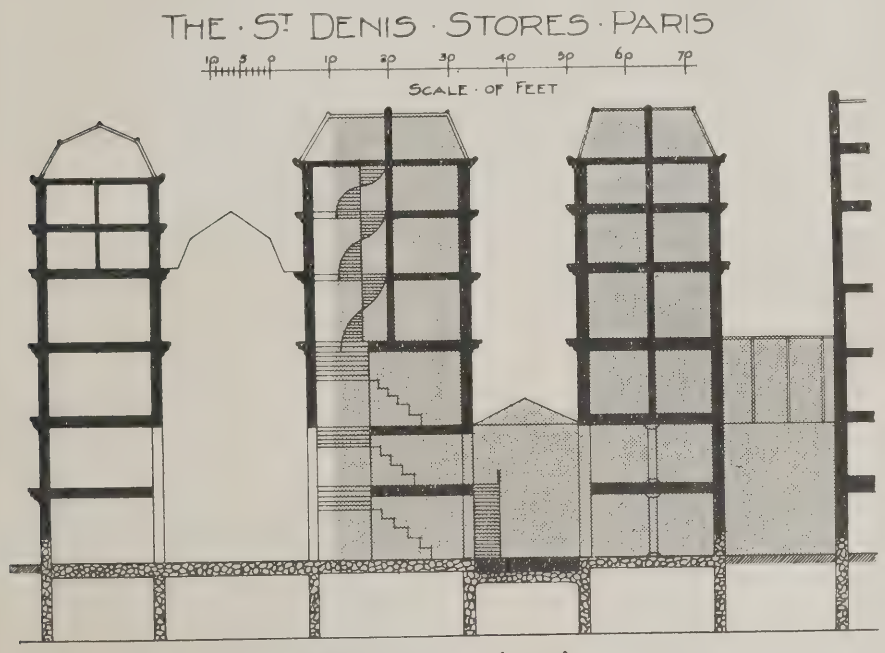
A NOTABLE FIRE AT A PARIS DRAPERY STORE.

It may be remembered that some little time back we published very full particulars of the fire at the Paris Telephone Exchange, which besides being a notable fire, curiously occurred on the same day as the fire at one of the great drapery stores for which Paris is noted.

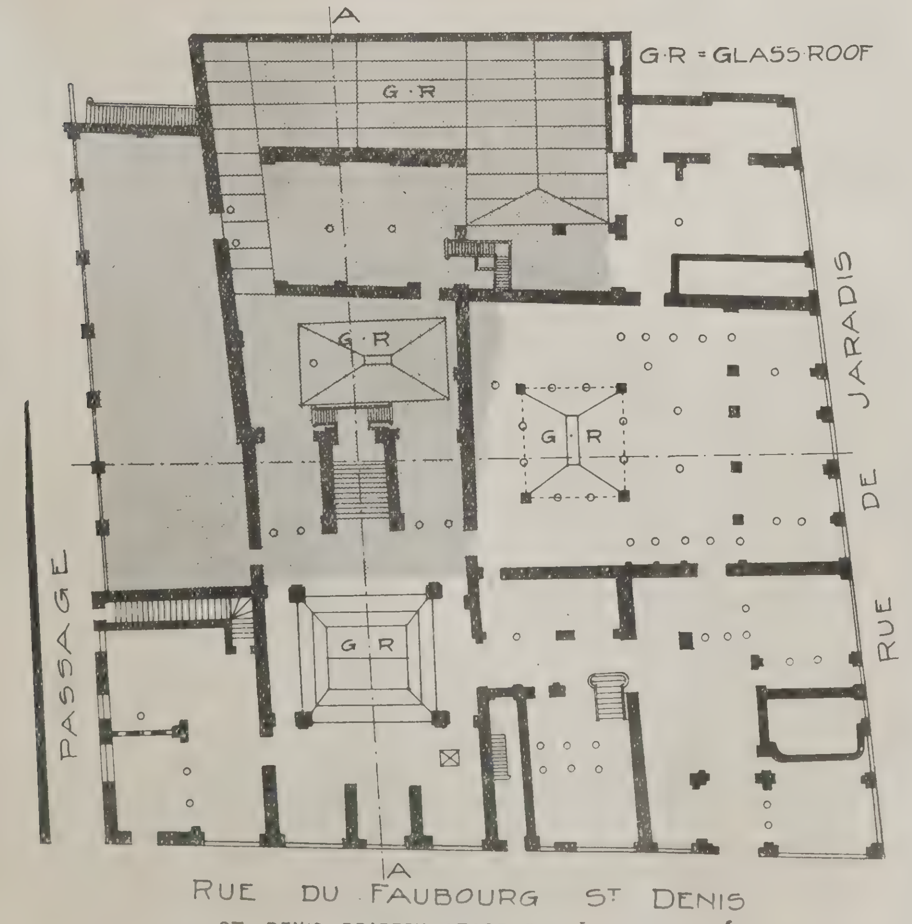
We are now presenting some photographs of this fire, which occurred at the St. Denis Stores, and we are also showing some plans and sections that will give some idea of the cubic extent involved. The chief reason for presenting these illustrations is found in their value as an object lesson in the necessity of not being too lax in the matter of cubic extent.

It may be remembered that the year 1908 is noted in the annals of building legislation for the passing of the amendments to the London Building Act that at length allow the metropolis to have buildings of greater cubic extent than heretofore, subject to the supervision of the London County Council, and particularly to its Superintending Architect and the Chief Officer of its Fire Brigade.

There can be no doubt that it is unwise to let any one compartment of a building be of an extraordinary cubic extent, and that it is of the utmost importance for the door openings leading from one compartment to the other to be protected by the very best steel roller shutter doors, which can be brought into operation promptly when required, and can be stowed away without interfering too much with the general conduct of the business in the buildings concerned. It is as an object lesson in this direction the illustrations are given.



SECTION A-A



ST. DENIS DRAPERY STORE FIRE. PARIS.
PLAN AND SECTION SHOWING PORTIONS AFFECTED BY THE FIRE.

CONCRETE AGGREGATES AND FIRE RESISTANCE.

An important interim report has been issued by the British Fire Prevention Committee, which may be looked at as a preliminary step towards standardising the question of concrete aggregates generally, but more particularly in respect to their fire resistance.

The Special Commission appointed by the Committee some time back, under the chairmanship of Sir William Preece, K.C.B., had the following reference to deal with:—

> "That having regard to the confusion existing as to concrete aggregates, and the absence of their exact specification, the British Fire Prevention Committee do hereby constitute from among its members and subscribers a Special Commission to report upon and define the aggregates suitable for concrete floors intended to be fire-resisting, having due regard to questions of strength, expansion, and the chemical constituents and changes of the aggregates."

The Commission that was entrusted with the consideration of this question had Mr. Edwin O. Sachs, F.R.S.Ed., as deputy-chairman; Mr. W. T. Hatch, M.Inst.C.E., and Mr. Max Clarke, F.R.I.B.A., as sectional chairmen of the sub-committees, entrusted with certain departments of the enquiry, whilst the membership included representatives from the Admiralty, such as Mr. C. H. Colson, M.Inst.C.E.; from the War Office, such as Col. A. H. Bagnold, R.E.; and such authorities as Mr. A. Ross, M.Inst.C.E. (Chief Engineer of the Great Northern Railway), Mr. W. H. Hunter (Chief Engineer of the Manchester Ship Canal), Mr. E. G. Rivers, M.Inst.C.E. (Chief Engineer H.M. Office of Works), Lieut.-Col. Winn, R.E., Mr. Restler, M.Inst.C.E. (of the Metropolitan Water Board), Mr. Frank Sumner (Chief Engineer to the City of London), and others, Mr. Matt. Garbutt, F.R.I.B.A., A.M.Inst.C.E., acting as honorary secretary to the Commission.

The report that has now appeared is precisely what it is intended to be, i.e., an interim report, and it tells us, in short, that nothing can really be done without a considerable amount of research work and test, that the reference to the Special Commission should be extended to cover concrete generally, and that funds and facilities must be found promptly to carry out the necessary investigations.

These necessary investigations, with the materials used for aggregates, comprise:—

1. Crushing tests;
2. Fire tests;
3. Tests as to the holding power of rods in concrete;
4. Deterioration tests;
5. Expansion tests, and certain chemical tests and analyses.

As to the precise materials for aggregates that the Commission holds should be under investigation, the following is the official list:—

ARTIFICIAL.

1. Coke breeze;
2. Clinker;
3. Blast furnace slag;
4. Broken brick;
5. (a) Gault clay burnt;
   (b) Ordinary burnt clay ballast;
   (c) Broken terra-cotta;
      (1) Porous;
      (2) Dense.

NATURAL.

6. Natural ballast (gravel);
7. Volcanic rocks;
   - (a) Basalts, traps, dense lavas, etc.;
   - (b) Lavas and rocks of similar character;
   - (c) Pumice, etc.
8. Crushed granite;
9. Sandstones, limestones, quartzites, and rocks of a similar character.

Continuing, the report indicates that, seeing there are at least fifteen materials to deal with, and that the tests, to be in any way reliable, will have to be conducted over a period of three years, the amount of work that is necessary is very considerable.

A programme of tests has been prepared by the Special Commission, and we see it indicated, for instance, that no less than 750 blocks of concrete are required for the crushing tests, 288 cylinders for the deterioration tests, 216 blocks for expansion tests, etc., and also 45 large slabs for the fire tests.

What, however, is of very great interest at the moment in connection with this interim report is a Schedule (A) attached thereto giving a clear specification for the various materials generally used for aggregates in this country, or, in other words, giving the professional man something authoritative to refer to when specifying aggregates, very much in the form of what might be termed a standard specification, and what may eventually be recognised as such. There are, of course, certain blanks still in the specification which will have to be filled in after due research, but even as it stands it is a most valuable guide, and should be of great value to all concerned.

The British Fire Prevention Committee is certainly to be congratulated on issuing the specification, even at this intermediate stage, instead of doing what so many societies do, locking away their work until all research and all queries have been settled up. The specification is not complete or final as it stands, but it serves immediate purposes.

Having regard to the importance of the question, we are printing the list of aggregates below:—

PROVISIONAL SPECIFICATIONS FOR CONCRETE AGGREGATES ISSUED BY THE SPECIAL COMMISSION ON CONCRETE AGGREGATES.

Artificial Materials for Aggregates.

1. COKE BREEZE.

Coke breeze for use as a concrete aggregate shall be entirely coke taken from the gas retort, coke oven, or special furnace. It shall be absolutely free from clinker, coal, and all substances that will not float in water, and from any admixture of material taken from the retort furnace or water-pan below it, and from cinder, ash, or other admixture. The proportion of sulphur in coke breeze shall not be more than.................per cent.

NOTE.—It was decided that the determination of the allowable amount of sulphur should be the subject of future consideration.

2. CLINKER.

Clinker for use as a concrete aggregate shall be the thoroughly burnt and hard waste product of furnaces, free from dust, shale, or free lime, and not having more than....................per cent. of sulphur.

NOTE.—Pan breeze is included in this definition.

NOTE.—In this case, as in that of coke breeze, it was decided that the determination of the allowable amount of sulphur should be the subject of further consideration.

3 BLAST FURNACE SLAG.

Blast furnace slag for use as a concrete aggregate to be obtained and selected from pig iron smelting furnaces (to the exclusion of basic slag), to be of porous quality, to be washed to remove dust and sulphur, to be without free lime, and not to contain more than...............per cent. of sulphur.

NOTE.—In this case also, it was decided that the allowable amount of sulphur should be the subject of further consideration.

4. BROKEN BRICK.

Broken brick for use as a concrete aggregate shall be from well-burnt and perfectly sound and hard clay bricks, such as London stock bricks, or bricks of equal quality, and shall be of the size specified and be free from old mortar, and from dust or particles that will pass through a sieve of ⅛-in. mesh.

5. (a) GAULT CLAY BURNT.

Burnt gault clay for use as a concrete aggregate shall be free from free lime and sulphur and from unburnt particles, and shall be thoroughly hard, so that pieces soaked in water for...........hours shall not disintegrate.

NOTE.—It was decided that the Tests Sub-Committee should be asked to determine the length of time to be inserted in the clause.

5. (b) ORDINARY BURNT CLAY BALLAST.

Ordinary burnt clay ballast for use as a concrete aggregate shall be free from free lime and sulphur and from unburnt particles, and shall be thoroughly hard, so that pieces soaked in water for.........hours shall not disintegrate.

NOTE.—It was decided that the Tests Sub-Committee should be asked to determine the length of time to be inserted in the clause.

5. (c) BROKEN TERRA-COTTA.

(1) *Porous.*—Broken porous terra-cotta for use as a concrete aggregate shall be (a) from clean and well-burnt earthenware, unglazed, which has been mixed before firing with some combustible material such as sawdust, so that after firing it is of a porous or cellular texture or (b) from clean and well-burnt unglazed earthenware which is capable of absorbing at least.................per cent. of its own weight of water.

(2) *Dense.*—Broken dense terra-cotta for use as a concrete aggregate shall be from clean and well-burnt earthen or stoneware, unglazed, and shall be incapable of absorbing more than.................per cent. of its own weight of water.

NOTE.—It was decided that the Tests Sub-Committee should be asked to determine the percentages to be inserted in these clauses.

Natural Material for Aggregates.

6. NATURAL BALLAST (GRAVEL).

Natural ballast for use as a concrete aggregate shall be gravel from river beds, sea coasts or glacial deposits, washed, if necessary, to remove dirt, loam, earthy or saline matter, clay, and other foreign substances.

7. VOLCANIC ROCKS.

All rock of volcanic origin for use as a concrete aggregate shall be entirely free from decomposed parts, and must show no signs of expansion, disintegration, or dissolution after having been immersed in water for 72 hours.

Rocks of this nature may be divided into the following classes:—

(a) Basalts, traps, dense lavas, etc., weighing not less than..............lbs per cubic foot. These shall be dense, thoroughly vitrified, not scoriaceous, show a clean fracture when broken, be homogeneous and free from marked cellular structure.

(b) Lavas and rocks of similar character, weighing not less than.......... lbs. per cubic foot. These shall be hard and free from all soft or organic matter, but they will not be so hard, and will be more cellular than those of section (a).

(c) Pumice weighing not more than ....lbs. per cubic foot. It shall be hard, free from all organic matter, soft dust or impurity, and show a bright silky structure when broken.

NOTE.—It was decided that the Tests Sub-Committee should be asked to determine the weights to be inserted in these clauses.

8. GRANITE.

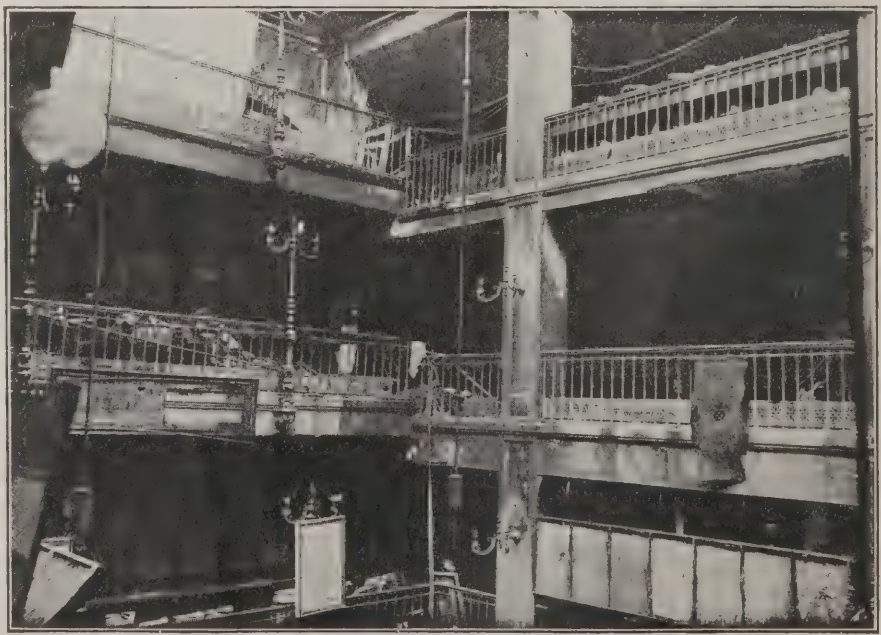
Granite for use as a concrete aggregate shall be obtained from..............(*here insert name of quarry*), and shall be reduced to the specified dimensions by crushing or breaking, and shall be close, hard, and of even texture; free from large crystals of felspar, dirt, argillaceous or organic materials, all decomposed particles, and from dust that will pass through a 1-16th inch mesh.

9. SANDSTONES, LIMESTONES, QUARTZITES, AND ROCKS OF SIMILAR CHARACTER.

Rocks of these characters for use as concrete aggregates shall be dense, uniform, and homogeneous in structure and composition. They shall have small, even grains and crystalline texture.* Frac-

---

*This is not intended to exclude Oolites otherwise suitable.



VIEW SHOWING CONSTRUCTION OF GALLERIES.
THE ST. DENIS DRAPERY STORE FIRE, PARIS.

tures shall be clean and free from large flaws. The weight of the material shall not be less than 130 lbs. per cubic foot, nor its crushing strength less than 200 tons per square foot, and it shall not absorb more water than 8 per cent. of its weight after immersion for 24 hours. The aggregate after preparation shall be free from all dirt, decomposed rock, argillaceous and organic material.

FIRE PROTECTION ON THE UNDERGROUND RAILWAYS.

We have frequently pointed out the danger of fire on our underground railways, particularly on the older ones, where a policy of false economy prevented the owners from doing what we consider their duty to the travelling public by reconstructing their railway stations on a fire-resisting system, and constructing their rolling stock of fire-resisting or non-inflammable materials.

Fires are occurring from time to time on the underground railways and tubes, and although these accidents are belittled, the danger is generally grave; and should they occur at an unfortunate moment, the result would certainly entail the most serious consequences.

We thus welcome the attitude of the London County Council in respect to this matter; and although their programme will impose additional work and responsibility upon the London Fire Brigade and its able officers, we hold that the new procedure is warranted by the better safeguards that the public will enjoy.

What, however, would be far more satisfactory would be a short Act of Parliament (of a retrospective character) making it compulsory for the underground railways and tubes to banish the whole of the inflammable material on the railway stations and rolling stock, within a certain given period, say within the next ten years. It is to be hoped that something will be done in this direction.

Report of the L.C.C.

"On 28-29th July, 1908, we stated that we had had before us a report by the chief officer of the Fire Brigade on the fire which occurred on 16th July, 1908, on the City and South London Railway, and that the report raised several questions of importance upon which representations should be made to the Board of Trade; and the Council authorised us to make, during the summer recess, any representations to the Board which we might consider necessary and urgent for the purpose of further reducing the danger from fire on the City and South London Railway and tube railways generally, subject to our reporting any action taken under such authority. We are now in a position to indicate the suggestions which, in our opinion, should be made to the Board.

"Dealing first with tube railways constructed since 1904, and built in accordance with the regulations laid down by the Board of Trade in that year, and with regard to which the chief officer has certified that efficient hydrants, hose, and fire appliances have been provided, we have two main suggestions to make. The first is that the fire appliances in question should be periodically inspected by the chief officer, with a view to seeing that they are efficiently maintained. This inspection is, in our opinion, essential, and it is desirable that in making this inspection the chief officer should deal with any points which may occur to him affecting the general question of protection from fire. He has already drawn our attention to some matters to which the Board's notice should undoubtedly be called. It is not anticipated that this work of inspection will involve additional expenditure. We further propose that, in order to save time, the chief officer should be authorised to communicate direct to the Board of Trade any suggestions which he may desire to make, reporting subsequently to us the action taken in each case. The other suggestion is that automatic signal lights, or preferably an illuminated sign, should be provided which would show on the platforms of the stations concerned, and also on the street level, when the current to the live rail is cut off in either direction. It is obviously very important that firemen and other persons working in the tunnel of a tube railway, as on the occasion of the fire on the City and South London Railway on 16th July, 1908, should have reliable information as to whether the current is on or not.

"As regards tube railways constructed before 1904, it is undoubtedly desirable from the point of view of public safety that they should be made to comply with the regulations of 1904 with as little delay as possible, although we realise that it may not be practicable to insist upon immediate compliance with the regulations in their entirety. We propose that the Board should be asked to consider this point, and, in the event of the Board not being prepared to insist upon all the regulations of 1904 being carried out, we suggest that the owners of such railways should at least be asked to carry out certain important provisions which we indicate below. These lines should of course be periodically inspected in the same manner as we proposed with regard to lines constructed since 1904. In the case of the City and South London Railway, we are informed that the company are carrying out certain works with a view of reducing the danger from fire on the railway, and that they are arranging to carry out further works, and to take other precautions which, while not bringing the line entirely up to the standard laid down in the Board of Trade regulations of 1904, go some considerable distance in that direction.

"Appended to the minimum requirements as regards fire-appliances made by the Board of Trade in 1904, at the Council's suggestions, was an observation to the effect that it should be borne in mind that in the event of a fire obtaining any hold in a tube railway the fire brigade would be practically of no avail, and that the railway authorities must therefore rely upon their own resources. In view, however, of the work the brigade were able to do at the fire on the City and South London Railway referred to above, we suggest that this observation should be altered so as to read that in the event of a fire on a tube railway not being readily extinguished by the railway employees, immediate notice should be given to the fire brigade by telephone and by the nearest fire-alarm. We recommend:—

"(a) That, in the opinion of the Council:

(i.) The fire-appliances on all tube railways, whether constructed before or since 1904, should be periodically inspected by the chief officer of the fire brigade with a view to seeing that they are efficiently maintained; and, in making such inspection, the chief officer should deal with any points which may occur to him affecting the general question of protection from fire, and should communicate direct to the Board of Trade any suggestions which he may desire to make.

"(ii.) There should be provided, on all tube railways, whether constructed before or since 1904, automatic signal lights, or preferably an illuminated sign, which would show on the platforms of the stations concerned, and also on the street level when the current to the live rail is cut off in either direction.

"(iii.) The owners of all tube railways constructed before 1904 should be called upon to comply, with as little delay as possible, with the requirements made in that year, or, if this is considered impracticable, such railways should at least be provided with—(a) fire-appliances as far as possible in conformity with the minimum requirements made in 1904; (b) a hydrant, with sufficient hose, fitted 100 yards down each tunnel from each end of each platform; and (c) an incombustible platform between and at the sides of the rails for persons to walk upon.

"(iv.) The minimum requirements, etc., as regards fire-appliances made in November, 1904, should be varied by the omission of the observation (d) as to the fire brigade being of practically no avail in the event of a fire obtaining a hold in a tube railway, and the substitution therefor of the following observation:—'In the event of a fire in a tube railway not being readily extinguished by the railway employees, notification should be immediately given to the fire brigade by telephone and by the nearest fire-alarm.'

"(b) That the foregoing resolution (a) be communicated to the Board of Trade."

RECENT OFFICIAL FIRE TESTS OF THE B.F.P.C.

Simple Means of Fire Extinction.[1]

In an age when everything is being patented, and when so many articles rank as proprietary, it is interesting to consider what we may term the simple applied means of fire-extinction, available to the man in the street and purchasable practically all over the country. We have previously mentioned that the British Fire Prevention Committee was undertaking a series of tests with buckets and hand-pumps, with a view of obtaining some data as to their relative efficiency as compared with the newer extinguishers now favoured in several directions. We also reported that, a great difficulty having been experienced in distinguishing petrol fires, even with the best of proprietary articles, the committee had undertaken a series of tests showing the efficiency of ordinary asbestos cloths, sand, and steam when petrol fires occur.

Two reports, dealing respectively with the bucket and hand-pumps, and with the asbestos cloths, sand, and steam as a means of fire-extinguishing, are now before us; and, having regard to the fact that architects and surveyors are frequently called upon to specify the fire-extinguishing equipment of buildings, both public and commercial, and to bring about improvements in our country houses, the reports (Nos. 128 and 133) may serve as a useful guide as to what can be obtained in the way of extinguishing gear at a very small output.

Buckets of Water, Hand-pumps, etc.

As to the tests with buckets of water, hand-pumps, etc., the preamble, which is signed by Mr. Edwin O. Sachs, F.R.S.Ed., chairman of the committee, is perhaps best indicative of what the tests were intended to teach. His note to report No. 128 runs as follows:—

> The tests here recorded were undertaken with a view of arriving at data which, if compared with those obtained in identical or similar tests in which hand chemical fire extinguishers are used, would allow of the relative value of the various types of first aid appliances being more properly realised than is generally the case.
>
> The chemical fire extinguisher (containing 2 to 3 gallons of liquid), if so constructed that it

can be readily and easily handled by parties not conversant with its action or peculiarities, has considerable advantages, assuming of course that it is in a proper workable and clean condition.

But it should not be forgotten that the ordinary bucket of water and hand-pump have a very high fire-extinguishing efficiency.

Thus, the advent of the hand chemical fire extinguisher should by no means imply neglect of the humbler and simpler extinguishing appliances.

We will not go into the detail of the report, but will present the summary, which reads as follows:—

Summary of Tests.

The following is a summary of the results of the tests by the Committee:—

The tests demonstrated that a small quantity of plain water energetically applied from vessels in common use, such as buckets and simple hand-pumps, is almost uniformly effective in extinguishing promptly small fires in their early stages, except in respect to burning spirit, such as petrol.

The efficiency of plain water so applied does not depend upon exceptional skill or dexterity in handling the vessels or appliances, but, given fair aim, is mainly effected by the amount of energy accorded to the operation of throwing or pumping respectively.

The following table summarises the number of buckets, etc., used, the time occupied in their application, the distance at which they were operated, and the effect noted:—

Test or Re-test.	Number Bucket, etc.	Time Occupied. min.	secs.	Remarks.
No. 1	2 tumblers, 1 jug, 1 pitcher, and 1 bucket of water, with a few splashes of second bucket.	0	50	Fire out in 50 secs.
1A	2 tumblers, 1 jug, 1 pitcher, and ½ bucket of water.	0	30	Fire out in 30 secs.
2	4 buckets, 1 hand pump, another bucket, then a bucket full in hand pump.	3	4	Fire checked, but smouldering continued.
3	2 buckets and 2 splashes out of a third.	0	20	Fire out in 20 secs.
4	8 buckets and 1 hand pump.	3	35	Fire out in 3 mins. 35 secs.
5	A little more than ½ hand pump.	2	1	Fire out in 2 mins. 1 sec.
6	1½ buckets.	0	22	Fire out in 22 secs.
7	3 buckets.	0	12	Fire out in 12 secs.
7A	¼ bucket of water from hand pump.	0	12	Fire out in 12 secs.
8	1 bucket, ½ hand pump	0	58	Fire out in 58 secs.
9	Half the contents of 1 hand pump, with the addition of 1 bucket played continuously.	1	0	Fire out, petrol all consumed.
9A	The contents of 1 hand pump and 5 buckets played continuously.	4	5	Fire out, petrol nearly all consumed.
10	—	not carr	ied out	
11	3 buckets.	3	5	Fire nearly out in 45 secs.; fire out in 3 mins. 5 secs.
12	4 buckets.	0	37	Fire out in 37 secs.

Note.—Each bucket contained about 14 pints of plain water on the average (buckets of 13 and 15 pints capacity were used), each pitcher 10 pints, each jug one quart, each tumbler ½ pint, hand pump 5 gallons.

Note.—No. 10 test omitted by order of the Committee.

We will only mention that amongst the small objects used, were tumblers, jugs, pitchers, buckets of water, and the every-day hand-pump, i.e., all the appliances that should be available in a well-managed establishment.

We also present an illustration showing the actual gear used, as it may be useful for specification purposes.

Regarding the description of the buckets and hand-pumps, the report gives the prices at which they are purchasable, also the range of efficiency. These details read as follows:—

Description of Buckets, Hand Pumps, etc.

Galvanised iron buckets, bought in the open market, were used. The two patterns used, with their dimensions, are shown in the illustration. The buckets, which contained 13 pints (7.353 l.) of water when filled to within 2 in. (051 m.) of the rim, cost 2s. 3d., and the buckets which contained 15 pints (8.519 l.), when similarly filled, cost 2s. 8d.

The hand pump was of the ordinary type, fitted in a large bucket, as shown in the illustration, purchaseable in the open market, at from £2 10s. to £4, according to quality and finish, and contained 5 gals. (22.717 l.) when filled to within 2 ins. of the top. The hose was of leather, copper riveted, and the nozzle had a diameter of 3-16 in. (4.762 mm.).

The pitcher was an ordinary earthenware bedroom pitcher of 10 pints (5.679 l.) capacity when filled to within 2 ins. (.051 m.) of the rim; the jug was an ordinary earthenware kitchen quart jug (1.136 l.), and the glass an ordinary ½ pint (.284 l.) kitchen tumbler.

Range of Buckets, Hand Pumps, etc.

The range, when handled by an able bodied man, selected ad hoc, and using the appliances without previous trial, was as follows:—

Hand pump 45 ft. (14.020 m.) at 10 secs.; 40 ft. (12.192 m.) at 30 secs., and 40 ft. (12.192 m.) at 60 secs., the appliance being exhausted in 1 min. 27 secs. (one man, one application).

The contents of the 13 pint buckets thrown 28 ft. (8.534 m.), (average of six throws by two men, three throws each).

The contents of the 15 pint buckets thrown 27 ft. 6 ins. (8.382 m.) (average of six throws by two men, three throws each).

The tests were the usual standard tests which the committee require for the small extinguishers of two or three gallons' contents, and comprised what might be termed the usual staple test, petrol test, heap-of-straw test, burning celluloid test, oily rag test, crate test, packing-case test, and the like.

As to the general arrangements, the directing member for these tests was Mr. Percy Collins, J.P., and among his sub-committee were Mr. Ellis Marsland (district surveyor) and two Fire Brigade officers, Mr. J. Herbert Dyer and Mr. R. W. Henderson, both vice-presidents of the National Fire Brigades Union. Sir J. Williamson, C.B., represented the Council, and Mr. Edwin O. Sachs represented the executive of the British Fire Prevention Committee.

Asbestos Cloths.

The test with asbestos cloths, sand, and steam was applied to burning petrol, and has been accorded very general public attention, no doubt having regard to the increasing number of petrol fires since the advent of motor traction.

The tests were of an extremely dangerous character, requiring considerable police and medical arrangements, and a very strong sub-committee.

The sub-committee had as its directing member again Mr. Percy Collins, and amongst those acting on it were Mr. J. Herbert Dyer and Mr. Henderson, referred to above; Mr. Horace Folker, the late hon. secretary to the Fire Brigades Union; Mr. Fulkes, insurance surveyor; and others conversant with the subject. Sir James Williamson and Mr. Edwin O. Sachs again did duty for the council and the executive, and among the very large attendance of members and visitors were included a number of eminent Government officials.

Here the tests were undertaken at the instigation of the Association of London Dyers and Cleaners, who have constantly to guard against fire hazards of a very serious kind.

The object of the tests is given as follows:

To ascertain the effect of the application of asbestos cloths, sand and steam upon petrol and various burning materials, but principally upon burning petrol, and more particularly under conditions which would be met in processes employed on the premises of dyers and cleaners.

The following is a summary of the results of the tests by the Committee:—

The tests demonstrated the complete efficiency of asbestos cloths in putting out burning spirit vapour.

In the case of burning materials it was demonstrated that asbestos cloths could be of use in confining the fire until other appliances were brought into play.

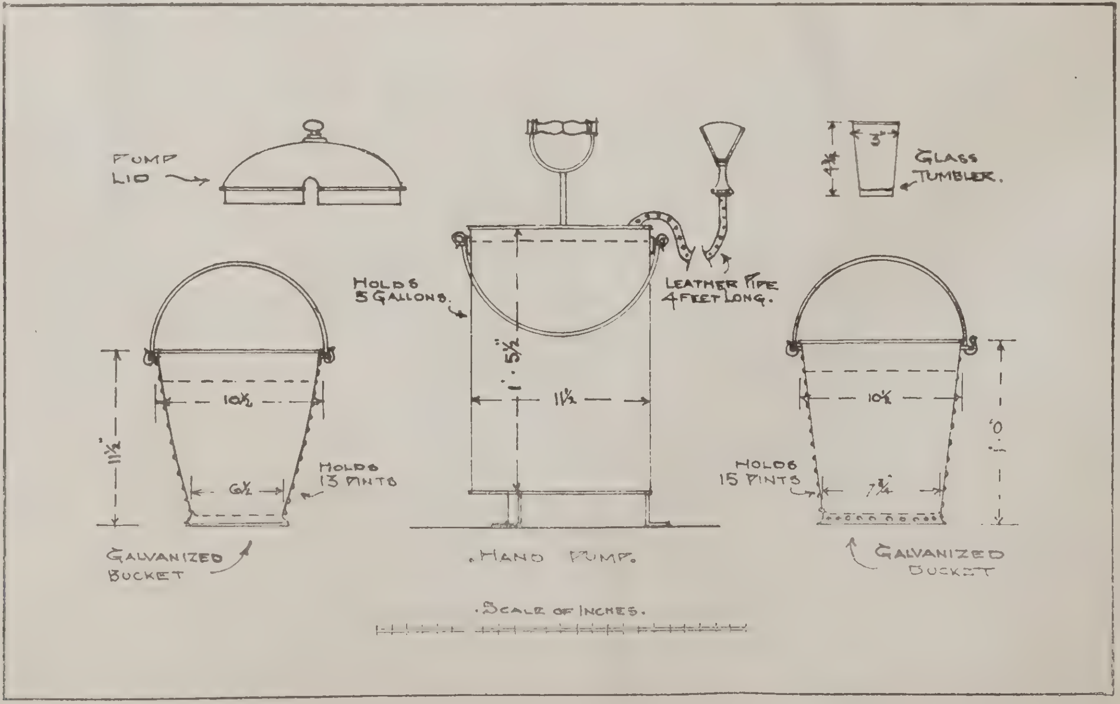
Note.—The efficiency of sand was demonstrated where it can be employed to soak up spirit, the vapour of which is ignited.

The efficiency of steam, as applied, was demonstrated where a building in which the fire is burning can be closed up, so as to exclude as much draught as possible.

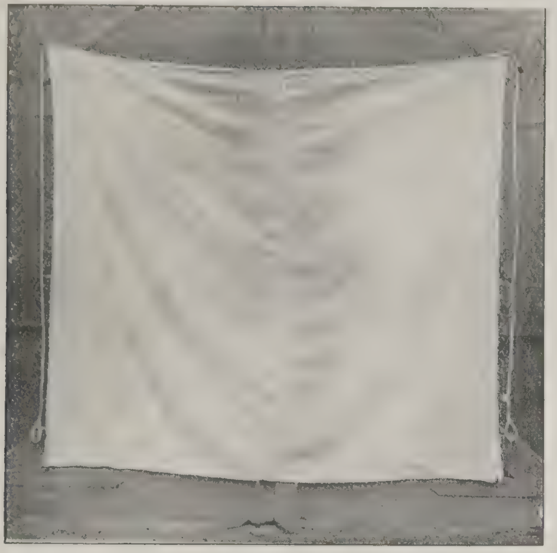
As to the lesson of the tests, Mr. Percy Collins writes in his preamble as follows:—

The application of the asbestos cloths was certainly effective, and fully demonstrated their great utility in subduing fires caused by spirit vapour. They showed that where trade processes need the employment of a volatile spirit, these asbestos cloths form a most valuable first-aid appliance.

As to the use of sand (which was applied in one case), its value was also shown, but further tests should be carried out.



THE HAND PUMP AND THE ORDINARY BUCKETS, ETC., USED.



AN ASBESTOS CLOTH WITH CORDS.
(*On right hand side*) A DYER'S VAT.
RECENT BRITISH FIRE PREVENTION TESTS.

With respect to the employment of steam—the effect of this was most marked. While there was plenty of ventilation in the upper part of the walls of the hut to correspond with what would be arranged for in buildings occupied for processes of manufacture requiring the use of volatile spirit, the steam, nevertheless, quickly diffused throughout the hut and quenched the fire. It is, however, important that the amount of steam available should bear a suitable relation to the cubic contents of the room or rooms to be protected.

The tests were certainly most instructive, and were taken by the committee, with what may be termed the minor fire appliances.

The reports are, as usual, very well printed and produced.

THE CONCRETE INSTITUTE.

At a meeting of the Council of the Concrete Institute, held on Thursday evening last, at which Sir Henry Tanner, I.S.O., presided, and at which there were present, among others, Sir William Preece, K.C.B., Mr. Edwin O. Sachs, F.R.S.Ed., Mr. A. Ross, M.Inst.C.E., Mr. William Dunn, F.R.I.B.A., Mr. A. F. Collins, M.Inst.C.E., Mr. Marsh, M.Inst.C.E., Mr. B. Hannon, B.A., Mr. L. Serraillier, and Mr. Frank May, J.P., it was decided that all new members resident in Great Britain, joining after the enrolment of the first five hundred members, should be subject to an annual subscription of two guineas, instead of the present subscription of one guinea, which latter subscription will, however, still be retained for new colonial and foreign members. The membership of the Institute already exceeds 400.

A number of appointments to the standing committees of the Instiute have now been held. The committees on science, on Parliamentary matters, on mass concrete, and on tests, have respectively as chairmen: — Mr. William Dunn, F.R.I.B.A., Mr. A. Ross, M.Inst.C.E., Mr. C. H. Colson, M.Inst.C.E., and Mr. W. T. Hatch, M.Inst.C.E., and the following are acting as honorary secretaries to various standing committees:—Mr. F. E. Wentworth-Shields, M.Inst.C.E. (science), Mr. J. E. Franch, A.R.I.B.A. (Parliamentary), Mr G. Kirkaldy, Assoc.Inst.C.E. (tests), and Mr. R. W. Vawdrey, B.A. (reinforced concrete practice).

The third general meeting of the Institute will take place at the Royal United Service Institute, Whitehall, on the evening of February 18th, when Mr. Serraillier will read a paper on certain aspects of reinforced concrete.

A cast of the Bacon statue, which is to be sculptured by Mr. F. W. Pomeroy, A.R.A., has just been erected on a wooden pedestal in the centre of South Court, Gray's Inn.

Works in Progress and Completed.

BEDMINSTER.—A new Council School in Parson Street was opened on the 12th inst. The new buildings, in two blocks, provide accommodation for 500 senior scholars and 530 junior scholars. The cost has amounted to £20,000. Mr. H. Williams was the architect, Messrs. E. Walters and Son the general contractors, while the plumbing and sanitary work was executed, under a direct separate contract, by Messrs. John Wilkins and Sons.

BEXHILL-ON-SEA.—The new Church of St. Barnabas is rapidly approaching completion, and is expected to be finished by April. The work comprises the completion of the original design by the late Sir Arthur Blomfield. Messrs. Dove Brothers, Ltd., of Islington, London, are the contractors.

BRIDLINGTON.—The Bridlington education authority has accepted the following tenders for the erection of new public elementary schools at Bridlington:—Building: Mr. A. A. Booth, contractor, Bridlington, £8,547. Heating: Messrs. Dinning and Cooke, Newcastle-on-Tyne, £272. Furnishing: Messrs. Illingworth, Ingham, and Co., Leeds, £576.

BROMLEY, KENT.—The Lyric Theatre here is being altered and improved, at an estimated cost of £700. Mr. Frank T. Verity, F.R.I.B.A., London, is the architect.

EDINBURGH.—The new science rooms at the University were opened by Mr. Haldane, the Secretary of State for War, on the 12th inst. The buildings, which we have previously described, were designed by Messrs. MacGibbon and Ross.

FLINT.—New Council Schools have been opened here. Mr. Samuel Evans, County Surveyor, was the architect, and the cost was £6,000.

HALIFAX.—Mr. C. Hodgson Fowler has prepared plans for the new Parish Church of St. Hilda, estimated to cost £6,000.

HULL.—A new block of offices in Lowgate, known as Middleton Chambers, was opened recently. The architect was Mr. B. S. Jacobs, F.R.I.B.A., Hull, and the general contractors were Messrs. Quibell, Son, and Greenwood, Ltd. The sub-contractors were: Carpenter and joiner, Mr. F. Singleton; plumber, Mr. F. Abba; slater and tiler, Messrs. Hunter and Son; painter, Mr. J. W. Maples; electrician, Mr. A. Shaw. The grates, chimney pieces, and tiles were supplied by Messrs. King and Co., Ltd.; the mosaic flooring in entrance and hall was laid by Messrs. Diespeker, of London; and the wall tiling by Messrs. Pilkington, of Manchester.

LONDON, DENMARK HILL, S.E.—The foundation work for the new King's College Hospital buildings has been commenced. Mr. William A. Pile, F.R.I.B.A., is the architect.

LONDON, W.C.—The Strand Palace Hotel, which is being erected for Messrs. J. Lyons and Co., Ltd., on the site of Exeter Hall, in the Strand, is approaching completion, and is intended to be ready for the public by June next. The exterior of the building, which has only a narrow frontage to the Strand, is faced with Carrara ware in French Renaissance style, and the interior decoration is to be carried out in that style and also in that of the English Georgian period. The main entrance is from the Strand, and leads to a lounge and thence to the winter garden, 130ft. long. The main dining hall is 94ft. by 59ft., accomodating 250 people; the drawing-room, 40ft. by 31ft., both opening from the winter garden. The grill room, smoking-room, and billiard-room are in the basement, reached by a double stair from the main hall. There are 450 bedrooms. The total cost of construction and equipment is estimated at £230,000.

POLLOKSHAWS, SCOTLAND.—The Sir John Maxwell School has been rebuilt on the site of the old school. The architectural treatment adopted is a bold and simple phase of the Renaissance, and red stone was used from the quarry at Locharbriggs, Dumfriesshire. The cost, including the fittings and furnishings, is estimated at £15,660, and the number of children for whom places are provided is 1,260. The architect is Mr. John Hamilton, F.R.I.B.A., while Mr. George B. Walker, I.M., is the measurer.

ROBERTSBRIDGE, SUSSEX.—The village institute, just completed, was designed by Mr. George Hornblower, F.R.I.B.A., London, and opened on Wednesday, the 6th inst. The building comprises a large hall arranged for theatrical performances, and capable of seating two hundred persons comfortably, a large billiard-room, games-room, library, and other accommodation. The building conforms with the style of the bulk of the houses in Robertsbridge, and the roof is covered with hand-made local tiles. Mr. S. Harvey, of Rye, was the builder, and Mr. James Gray, of Chelsea, provided the heating installation.

ROCHDALE.—The Town Council has accepted the tender of Messrs. Thompson and Brierley, Bury, at £8,285, for the erection of the Castleton branch baths.

SKELMANTHORPE.—A new Liberal Club is in course of erection at a cost of £1,000.

THE BUILDERS' FOREMEN'S ASSOCIATION.

The fifteenth annual dinner of the Builders' Foremen's Association was held on Saturday evening last in the King's Hall of the Holborn Restaurant, where about 250 gentlemen sat down under the chairmanship of Mr. W. Millar Higgs (Messrs. Higgs and Hill). Among those also present were: Messrs. A. D. Ford (president of the association), B. Rees (secretary), Edmund Wimperis, F.R.I.B.A. (Messrs. Wimperis and Best), F. G. Rice (Messrs. Rice and Son), W. Matthews Hill (Messrs. Higgs and Hill), J. W. Sawyer (vice-president), T. Sturge Cotterill, J.P., etc. After the usual loyal toasts, the chairman submitted "The Builders' Foremen's Association." As the name implied, he said, this was an association composed mostly of builders' foremen, although they had amongst their members many leading men of the allied trades, and also many clerks of works, who were gladly welcomed as members of the association, for they looked upon them in their business life, for the most part, not as men who were placed upon their buildings to prevent scamping and work of an inferior nature, but as men who were there as their helpers and friends, and who were of infinite value in settling many minor points in the course of the building's construction, that would necessarily be otherwise delayed. They would all agree with him that the builders' foreman was, generally speaking, a jolly good, all round man—(hear, hear); his position was by no means an easy one, his responsibilities were great, and in these days of competitions, when prices were cut to the lowest farthing, and then a percentage taken off the lump sum in order to secure the work (or, at least, to get somewhere in the running), the builders' foreman, or foreman of the allied trades, had all his ingenuity taxed to be able to bring his job out in a proper manner in justice to the architect and client, and to the good name of the builder, or firm by whom he is employed, at a profit, or, at least, without a loss. Again, in times of depression and slackness of trade like they had been passing through of late, the life of the man who took on and discharged the men was a distressing one, for if he had a heart at all, to see men whom he knew to be honest workmen in want, it must be hard indeed for him to act justly to his employer, and, at the same time, with feeling towards his fellow men. An association of this kind, properly conducted, as this association was, could not be anything but a real help to the foreman. As architects and surveyors and builders had their separate institutions and benevolent associations, and the working men had their various trade unions for mutual help, so it was essential for the leading men of every trade to be bonded together in a society of this kind, whereby they could derive help and instruction in their business life, and some practical assistance when they were in need. He was glad to say that the Builders' Foremen's Association was all this to its members. Since it was founded, in June, 1894, it had steadily increased both as regards membership and usefulness. Lectures on trade matters were from time to time arranged, visits to buildings in course of erection, and various works frequently took place, when the members of the association had the opportunity of exchanging views with one another upon matters connected with their daily work, thus quickening their interest in what they had to do day by day. Although last year had been a most trying one, the Builders' Foremen's Association had held its own, and he would strongly urge any young foremen who might be with them that night, and who were not at present members, to join at once. Unity is strength, and young blood was gladly welcomed, and would receive much help by belonging to an association of this kind. The association had a contingent fund for the purpose of assisting to a limited degree members that had got in a position of distress, and the insurance fund of the association provided the sum of £10 to the widow of a deceased member. Another fund had lately been inaugurated, that known as "The Pension Fund." (Cheers). This came into operation for the first time this year, and he having the honour to preside at that dinner, had made a special appeal to most of those with whom his firm had business relationship, in view of being able to hand over a good amount which should give this fund a good send off. (Hear, hear.) Many who would have gladly subscribed to so good a cause had written to him saying that, owing to the great depression in their trade, they felt that they could not give, and he knew the cause of their writing this was all too true. On the other hand, he had received many kind letters, enclosing cheques, and he felt most grateful to those gentlemen, many of whom he was glad to see with them that night, for so generously responding to his appeal, notwithstanding these depressing times. He would not detain them by reading the list through, but the full list would appear in the next quarterly report. He had much pleasure in being able to hand their hard-working and most energetic secretary a cheque for £125 4s. He might say that the pension fund, as it now stood, provided for an allowance of 5s. per week to a member of the association of 15 years' standing, of 60 years of age, if not at work, and he was glad to tell them that this benefit was extended to the widows of deceased members. The fund was the only object for which the association sought outside pecuniary assistance, and to establish this fund upon a firm basis must be the object of every member. He should like to see sufficient funds to justify a grant of 7s. 6d. per week to members of the Builders' Foremen's Association, who had spent so much of their lives in superintending the erection of the beautiful buildings they had in this great city of theirs. (Cheers.)

MR. W. MILLAR HIGGS (MESSRS. HIGGS & HILL).

The toast was enthusiastically received, and Mr. A. D. Ford, the president of the association, with whose name it was coupled, in responding, said the Association welcomed the specialist in the various departments of their work, knowing, as they did, that it was only by specialisation that improvement could be secured and perfection approximated. They knew something of the great qualities possessed by their leading men in the building industry, and these qualities only needed closer union, they believed, to revive trade and improve the material interests of all concerned. The high culture and integrity that distinguished their architects and surveyors, the great business ability and sense of justice and fair play that characterised their employers, the skill and experience which were their pride and boast no less than their fidelity of contract, were qualities the co-operation of which should dispel the cloud of depression that had wrought such havoc to the material interests of so many, and should give place to a future brighter and more prosperous, they believed, than had ever been in the past.

Mr. Edmund Wimperis, F.R.I.B.A., in proposing the toast of "The Building Trades," said that it had come to be required of an after-dinner speaker that he should not be destitute of humour. He found himself somewhat at a loss, because while other great industries, such as golf and fishing had their own stories and their own humour, so far as his experience went, the great building trades were without any special humour that he was aware of. But there was a more serious side to the toast which he had to give them. The great building trades and the great allied trades represented to this country something more than an industry. They represented very largely the history of this country. It was not a modern growth, this building trade; it was as old as man himself, and it was not a stationary growth. It was as new as the Japanese Empire, and it was a scientific growth. He noticed in the paper that day that the Japanese had a cure for earthquakes and were building in ferro-concrete. That meant a very big thing, and, speaking as an architect, he felt that the subject was too big for him, with all his big ideas, to handle successfully. Of course, politics at such a gathering as that were naturally and properly tabooed, but he could only say that, apart from politics, they would be cravens, and worse than cravens, if they hesitated to take any step which might be a cure for the great depression which this great industry had undoubtedly been going through. Let them think for a moment of the way in which this industry spread the money which was earned in it. Let them take any great building that they liked and think how far the ramifications spread and the numberless channels into which the prosperity of that building had been split, and the numberless homes into which some of the money which that building cost had gone. That meant that the prosperity of the building trades was a matter not only of happiness, but of life and death in thousands of homes in this country.

Mr. F. G. Rice, whose name was coupled with the toast, expressed his thanks on behalf of the building trades for the way in which the toast had been received. They were, he said, certainly living in times of very great depression and anxiety. Some considered that the new patent law would require more factories to be built, and said there was no doubt there would be a change in building. He thought it was known to most of them that the London County Council had before them a Bill to permit structures of the iron skeleton type and ferro-concrete to be erected with thinner walls, and as reference had been made to the specialist, he would like to suggest to them all to become specialists in that form of construction. In his opinion it would be a type of building largely used in the future, and he thought it behoved every one of them to make themselves acquainted with its principles, so that when their employer had a job of that kind to do, instead of having recourse to the specialist, he might give it to Bill, Tom, Harry, or Joe, whom he had known for many years, and in whom he had every confidence. This was the first time he had come to one of their dinners, and he expected to have heard the vexed question as to who put up a building satisfactorily settled. Three people claimed to erect a building—the builder's foreman, the builder, and the architect. He would remind them of the Prince of Troy, who was asked to adjudicate between three fair ladies, and to give the golden apple to either Venus, Juno, or Minerva. He was unwise to give it to Venus, with the result that Minerva and Juno pursued him all the days of his life. In regard to the erection of a building, he would like to say that all three were responsible, and that without all three the beautiful buildings they had in London could not be erected. He had been struck sometimes with the manly and straightforward manner in which the foreman met the architects, and he felt sure the architects appreciated it. Emerson said: "Nothing astonishes man so much as common sense and plain dealing." He read the other day of a Babylonian building law, which enacted that if a builder had built a house and had not made his work firm, and if the house had fallen down and killed its owner, the builder should be put to death. That was a forerunner of their present Building Act. Builders never knew what was going to happen with the Building Act. It required a lawyer, architect, and builder combined to understand it, and then they had to go to someone at the County Council to explain it after all. In conclusion, he hoped they would all have a prosperous year and find plenty of work.

The toast of "The Architects and Surveyors" was submitted by Mr. W. Matthews Hill, who said that the architect represented the theory and the general foreman the practice, and each admired in the other that quality without which no work could be brought to true perfection. In regard to the surveyor, they could only call him the general foreman's guide and comforter, for were not his quantities the best guide a foreman could have, and was he not a true comforter when he came to take up the general foreman's list of extra works?

In replying to the toast, Lieutenant-Col. G. E. Holman asked who was it who could make a bag of cement go farther than anyone else in this world? It was the foreman. Who was it who could get rid of all the batts which came to a building? The foreman, of course. And who was it who, when the building was completed, and the poem which the architect had seen in his mind and put on paper, was crystallised into bricks and stone, who was it who took all the credit for the work The foreman? No; the master, the builder. He owed a great deal to the builders' foreman. Might he say that he thought the builders owed a great deal to the foreman too, far more sometimes than they knew, and, he was sorry to say, far more sometimes than was recognised by the builders.

Mr. J. W. Sayer submitted the toast of the "Visitors," and Mr. T. Sturge Cotterill, J.P., briefly responded.

Mr. W. Faldo proposed the health of "The Chairman." There were, he said, many thousands of hearts and many hundreds of homes that had been made very much happier by the work which their Chairman had done outside his ordinary business. The toast was warmly received, and the Chairman, in response, briefly expressed his thanks for the reception of the toast and the pleasure it gave him to be present. In conclusion, he said he had pleasure in announcing that his list for the Pension Fund now amounted to £135 14s.

During the dinner selections were played by the band of the 103rd London Company Boys' Brigade, and the toasts were interspersed with songs and other items.

Federation News.

MONTHLY REPORTS.

YORKSHIRE FEDERATION.
Secretary: J. Davidson.

The annual general meeting was held at the Town Hall, Wakefield, on Thursday, December 17th. Mr. J. Biggin, President, was in the chair, and 53 delegates recorded their names in the attendance book.

The annual report and balance sheet of the Executive Council for the year ended November 30th, 1908, was presented and considered. Proof copies had previously been supplied to the members, and, on the motion of the president, seconded by Mr. W. T. Ledgard, the report and statement were taken as read.

On the motion of the president, seconded by Mr. W. R. Thompson, the report and balance sheet were approved and adopted; and it was decided to print 1,500 copies for circulation among the members, the final printing to be left over to January, until the new representatives are appointed.

The Federation passed with acclamation a resolution submitted by Mr. W. R. Thompson, seconded by Councillor W. G. England, J.P., tendering to Mr. A. J. Forsdike the deep gratitude and high appreciation of the Federation for the most valuable services he had rendered as treasurer during the past four years. Notwithstanding the prevailing depression during this period, Mr. Forsdike had, by genial and persistent efforts, maintained the finances in a comparatively satisfactory condition.

Mr. J. Biggin, the retiring president, stated that he had the greatest pleasure in proposing Mr. W. R. Thompson, of Dewsbury, as president of the Federation during the ensuing year. Mr. Thompson had been unanimously nominated for the office, and his ability and qualifications were well known to the members. It was therefore not necessary to say anything further, as Mr. Thompson's splendid record of the past, coupled with his willingness to carry out the work, had already received signal recognition from his fellow-members. The motion was seconded by Mr. W. T. Ledgard, who briefly referred to the services rendered by Mr. Thompson to the Federation since its formation.

The motion was carried with acclamation.

Mr. Biggin thereupon invested Mr. Thompson with the insignia of office, and tendered his hearty congratulations on his appointment. He pointed out that the satisfactory discharge of the duties would involve a great sacrifice of time, and the careful consideration of many and varied subjects. He estimated that during his year of office he had travelled about 6,824 miles on Federation business. Mr. Thompson then took the chair, and thanked the members for the honour which they had conferred upon him. He made a strong appeal for a deeper interest in the work of the local associations, as both the County and National Federations to a large extent depended upon these being maintained in a strong and healthy condition. He sincerely hoped that the optimistic views which had been expressed in many quarters of signs of a revival in the building trade would soon begin to fructify, and that members might at an early date find encouragement and congratulation in an increased volume of work. He moved that the best thanks of the Federation be officially tendered to Mr. Biggin for his most valuable services as president during the past year, and that his name be added to the list of ex-officio members of the Council.

Ald. W. H. Jessop, J.P., seconded the resolution. Mr. Biggins' services, he said, were undoubtedly deserving of the fullest acknowledgment which the Federation could bestow. He hoped that his health would be maintained and that he would continue to give the Federation his counsel and advice for many years to come. Mr. Biggin expressed his thanks to the mover and seconder of the resolution for their kind references, and to the Federation for their hearty response.

On the motion of the President, seconded by Mr. A. W. Sinclair, Councillor W. G. England, J.P., of Barnsley, was appointed senior vice-president for the ensuing year; and on the motion of the president, seconded by Mr. W. Irwin, Mr. A. J. Forsdike was appointed junior vice-president. This concluded the business of the annual meeting, which was followed by the monthly meeting of the Council.

BRADFORD ASSOCIATION.
Secretary: J. Davidson.

The annual meeting of the Bradford Association was held on December 23rd. Mr. T. E. Taylor, president, was in the chair, and, in addition, 13 members were present. A short resume of the work of the association was given by the secretary, and the treasurer submitted a statement of receipts and payments, which was duly approved and adopted. The thanks of the association were tendered to Mr. J. Moulson for his valuable services as treasurer, and to Messrs. T. Obank and C. W. Booth for auditing the accounts during the year. The following officers were appointed for the ensuing year:—President, Mr. T. E. Taylor; vice-presidents, Messrs. R. Raper and C. W. Booth; treasurer, Mr. J. Moulson; auditors, Messrs. T. Obank and C. W. Booth. The General Committee was also appointed, together with representatives of the Local Conciliation Board and to the Yorkshire Federation. The best thanks of ,the association were tendered to the president, and to the representatives to the Yorkshire Federation, for their valuable services during the year.

Messrs. C. W. Booth and W. H. Holroyd were appointed to represent the association at the National Federation meeting in January. It was resolved to invite the Yorkshire Federation to hold the February meeting in Bradford. The president afterwards entertained the members to tea.

LEEDS ASSOCIATION.
Secretary: J. Davidson.

A meeting of the Leeds Association was held on December 8th, Mr. W. Irwin in the chair. The chairman and secretary were requested to see the highways surveyor with respect to the recent practice of charging for paving repairs by time instead of by measurement.

The General Committee reported that they had investigated a difference which had occurred between two members, and which, as a result of the meeting, had been adjusted to mutual satisfaction.

The question of tenders for repairs for the Education Committee was considered, and it was resolved to send a letter with respect to the same.

A discussion took place as to payment of apprentices on completion of indentures, and also as to arrangements for the more prompt inspection of drains by the corporation staff.

LEICESTER ASSOCIATION.
Secretary: S. A. Dove.

Business in the building trade seems to be improving somewhat in the Leicester district.

A meeting of the General Council was held on December 22nd, when it was decided to hold the annual meeting of the association on February 4th, to be followed by a dinner.

Since the demolition of the Floral Hall (on which site, now stands the Palace Theatre), there has been a lack of accommodation for concerts, etc., and as a result of this the Leicester Town Council have lately been discussing the advisability of erecting a public hall. A committee was appointed to secure a site, and they proposed that a hall should be erected on land belonging to the corporation in Regent Road, close to the Victoria Park. The committee were restricted to a limit of £15,000, which sum seemed very inadequate for the purpose of a public hall. However, the committee secured an estimate from a Norwich firm of contractors for the sum of £13,650, and guaranteed not to exceed this amount. A deputation from the Amalgamated Society of Carpenters and Jointers waited upon the chairman of this committee informing him that the firm it was proposed should put up this building was not considered a fair house

The report of this committee was brought before a full meeting of the Town Council, and after considerable discussion for and against the adoption of the report of the committee, the proposal was defeated by a small majority.

This matter caused a great deal of correspondence in the local papers, as the proposed site is quite a mile from the centre of the town, and it has been naturally contended that a public hall should be in the centre of the town.

PRESTON ASSOCIATION.
Secretary: John Tomlison.

The fifteenth annual dinner of the Preston Building Trades Employers' Association was held at the New Association Rooms, Mount Street, Preston, on Wednesday evening, December 16th, when the president (Mr. Thomas B. Garnett) occupied the chair. There were about 50 members and friends present. After the usual loyal toasts, the president proposed "The Preston Building Trades Employers' Association." Mr. R. H. Catterall, in responding, expressed his opinion that they had done a very good thing in opening the new premises, which would offer opportunities for the members to meet each other at any time to discuss trade questions or for social intercourse. With regard to relations with the operatives, he was pleased to say that in the whole of his experience he never remembered anything in the form of a tyrannical action with the operatives of Preston.

Mr. E. Shorrock proposed "The Town and Trade of Preston." Mr. J. Cartmell, in responding, said there was no doubt that the cost of food, etc., was cheap in Preston as compared with many other manufacturing towns, it being so centrally situated, and he thought that fact should be taken more into consideration with regard to the wages of the men. Referring to trade matters generally, he attributed the bad times to the heavy rates that were being imposed by corporations, and to the fact that, rather than speculate in building, people preferred to accept the small interest on bank deposits.

Mr. W. Croasdale proposed the toast of "The President and Officers," to which Mr. T. B. Garnett responded. Mr. W. Cooke, junr., also replied.

SHEFFIELD ASSOCIATION.
Secretary: Thos. Smith.

The following paragraphs were held over from the report of the Sheffield Association given on p. 43 of our issue of January 13th:—

A letter was read from the secretary of the Antwerp M.B.A., thanking the association for its expressions of sympathy in connection with the lamented death of the Burgomestre of Antwerp, who was an honory president of the Antwerp Association.

A further letter was read from the secretary to the Builders' Merchants' Association, asking the M.B. Association for their suggestions as to the establishment of a preferential tariff for builders.

A letter was read from Mr. A. Mastin resigning his position as treasurer of the association. Mr. Mastin pointed out that it was mostly on account of ill-health that he felt compelled to tender his resignation of the post he had held for ten years. He should still take the same interest in the work of the association. The letter was received with sincere regret. Much sympathy was expressed for Mr. Mastin in his recent illness, and congratulations on his convalescence were tendered. Mr. Forsdike and Mr. Cook voiced the general feeling in remarking that the loss of Mr. Mastin as treasurer would break a link with the happy relations of the past, and they had got to look to him as treasurer for such a long period that they positively could not imagine anyone else occupying the position. As an Association they could not afford to lose him, much as they regretted the circumstances which had led to his decision. They felt sure that, on the unanimous request of the association, he would be prepared to reconsider his decision. Mr. Forsdike moved, and Mr. Cook seconded, a resolution instructing the secretary to convey the feel-

At the monthly meeting of the Executive Council, Mr. W. R. Thompson, president, occupied the ing of this meeting to Mr. Mastin, and on the motion of Mr. Longden, seconded by Mr. Roper, the president, Mr. Forsdike and Mr. J. Biggin were appointed as a deputation to see Mr. Mastin and use their influence in persuading him to withdraw his resignation.

The treasurer's statement showed the usual progress in comparison with previous years, the amount collected to date for subscriptions and levies being £77 19s. 10d. in excess of 1906, and £41 7s. 10d. in excess of 1907. This satisfactory result, it was pointed out, was due in some measure to the success of the new method of assessment, whereby members, with scarcely any important exception, made a return of annual wages and number of men employed to the secretary, such returns being entered in a locked ledger, and not being disclosed under any circumstances whatever to any other official of the association. By this means members paid on the same basis as that on which they paid their insurance, and the objectionable and unsatisfactory assessment, which at best represented but the guesswork of a committee, was avoided. The instalment of this system had involved an enormous amount of extra clerical labour, and the committee appointed at last meeting had come to the unanimous decision that the much-improved position of the association warranted an increase in the secretary's remuneration. Mr. Forsdike, speaking on behalf of the committee, moved that the secretary's salary be increased to £50 per annum, and Mr. Cook, in seconding, suggested that the increase should be made retrospective, and apply to the current year. The president and Mr. Powell supported, and the resolution was unanimously carried. Mr. Forsdike then called attention to the very satisfactory manner in which the secretary had carried out the arrangements for the trip to Belgium, and moved that a sum of ten pounds be paid to the secretary, as compensation for the loss of time, etc., involved. Mr. A. T. Biggin seconded, and said that the organisation of the trip was a credit to the secretary and the association. The resolution was supported by Messrs. Longden, Boot, and Jones, and unanimously carried

The Secretary thanked the association for the generous manner in which they had met him. It was his ambition when appointed, over two years ago, and was his ambition still, that the association should prosper. He had put a large amount of work into it, and although there were disappointments, the net result of two years was that the membership was about double. He hoped that the association was still only on the threshold of its success, and that he would always be able to justify their confidence.

The next item of the agenda established a record, almost a dual record. In the first place, there was a resignation, which was a rara avis, and in the next place there were twenty new applications for membership of the association, this being the largest number of applications presented at one meeting.

Some discussion took place as to the amount of contribution to the Yorkshire Federation, it being pointed out that Sheffield had contributed in respect of associate members on an ordinary members' basis, and in its total of £59 odd had contributed the largest amount of any association in the Federation.

In the absence of the members who raised the question of the status of membership and the use of the national crest, the matter was left to next meeting.

The committee appointed to consider the advisability of the adoption of day-work prices stated that they were not yet prepared to present their report. They had decided to obtain further information from other towns.

SHIPLEY AND DISTRICT ASSOCIATION.

Secretary: J. Davidson.

The annual meeting was held on December 9th. The secretary's report and statement of income and payments was submitted and approved. Representatives were appointed to attend the annual general meeting of the National Federation in January. The following officers were appointed for the ensuing year:—President, Mr. Walker Cryer; vice-presidents, Messrs. H. Dawson, S. Pitts, and A,. Parker; treasurer, Mr. F. Pitts. Messrs. A. Kendall and J. Midgley were reappointed as representatives to the Yorkshire Federation. An interesting discussion on several matters of trade importance followed.

SOUTH SHIELDS ASSOCIATION.

Secretary: J. G. Robertson.

The monthly meeting of the South Shields Association was held in the Victoria Hall on Friday evening, January 8th, the president (Councillor J. T. Armstrong) in the chair. Despite the most inclement weather, there was a large number of members present. On the National secretary's circular being read respecting the number of members and number of men and apprentices employed, a long discussion ensued on the apprentice aspect of the question. All seemed to be agreed that for some time it has been practically impossible to get lads to become apprentices. It was related as a fact that more than one firm had advertised over three weeks and had not received a single application for apprenticeship. On the other hand, in this district the engineering employers have constant applications from lads wanting to become apprentice engineers. The hope was expressed that the matter would be on the agenda for the National meeting to be held in London on January 27th, and that an effort would be made there, if not to solve the question, at any rate to throw out suggestions that might help to lead to the desired solution.

Attention was drawn to the recommendations that had been made by the committee inquiring into the operation of the working of the "Fair wages clause" in all Government work. It was strongly felt that serious attention would have to be given to this question, so that the trade unionist idea of incorporating the "Fair wages clause" into all Government contracts and work might be opposed.

The president, on the motion of Mr. J. Moore, seconded by Councillor W. J. Robertson, was unanimously deputed to attend the National annual meeting. Councillor J. T. Armstrong also promised to attend.

Messrs. J. T. Armstrong, A. Ross, T. Anderson, and W. V. Jary were elected our representatives on the Tyne and Blyth Federation of Building Trades Employers. The telephone card was finally approved for distribution.

Trade and Craft.

Uralite Asbestone.

The announcement that large contracts from the Admiralty and from the London County Council have been recently placed with the British Uralite Company (1908), Ltd., 16, St. Helen's Place, London, E.C., will doubtless stimulate enquiry for the firm's products. Notable among these is Asbestone, which is an improved make of the well-known asbestos cement slate. Asbestone has many uses. Light in weight, yet dense in texture, it effects a considerable saving in roof-timber, upon which it imposes comparatively little weight, and is an excellent non-conductor. Being tough and durable, it is but little liable to breakage, either in transit by land or sea, or when being washed, or when established in position. These qualities render it of particular value for the tropics, transport being rendered easy and unusually free from risk of damage, while the non-conductivity of the material is, in climates that are subject to fiercely hot sunshine, a consideration of great importance. Its immunity from attack by the devastating white ants and other destructive vermin is another strong recommendation. The material is also incombustible, and resists acid and sulphur fumes. For roofing, it may be used in sheets 6ft. by 3ft., or in the form of tiles 18ins. square, or in slate style, 20ins. by 10ins. The larger sizes, of course, lessen the labour of fixing. In sheet form it is largely used for lining ceilings, for partition work, and particularly for the construction of bungalows. Its value as an insulator has been recognised in its extensive adoption in electrical work—for cable casings, switchboards, etc. Asbestone is manufactured in any size up to 6ft. by 3ft., and in thickness from ⅛in. to 1in. The thickness most in demand is 3-16ths inch, for which the price is 1s. 10½d. per square yard; other thickness being charged for at a proportionate rate. It can be had white or grey at the price mentioned, or red at ten per cent. higher cost. It can, of course, be decoratively treated, and is much in use for panelling. It is damp-proof as well as fireproof, and, altogether, is a material that the architect is likely to find increasingly useful in a wide range of adaptability. That it is of British make is a guarantee of uniform excellence in the product.

Revolving Shutters and Collapsible Gates.

Messrs. Dennison, Kett and Co., engineers and contractors to the War Office, H.M. Office of Works, London County Council, etc., have issued a catalogue of their revolving shutters, collapsible gates, etc., in which the illustrations are uncommonly clear and elucidatory. This characteristic is especially notable in the full-size sections of revolving shutters. These shutters are made either with pinewood laths or with laths of iron or steel; the wood laths being connected with steel hinges, or with steel or copper bands. Various types and patterns are described, many of them made on the self-coiling principle for openings up to 6ft. wide, while for more extensive openings worm-wheel gearing is recommended. In some instances the noise caused by coiling is reduced to a minimum by leather strips placed on the edges. Various plans of arranging coils of revolving shutters, and various positions for sunblinds are indicated in a series of sectional illustrations. Shutters for dividing large schoolrooms, etc., are included Improved non-slipping stair-treads of rolled steel, with lead filling, are for fixing to iron, stone, or wood steps that have become worn. They are stocked in various convenient widths, and are supplied either with or without nosing. The patent improved collapsible gates (Dennison's patent) are made in various sizes, in one piece to collapse to one side, or in halves to collapse to both sides. It is explained that in these gates the diagonals are fixed in a solid cross-head, dispensing with the usual loose slippers, and making a thoroughly rigid gate. Semi-prism and lens pavement and vertical lights are also shown, and several pages are devoted to various patterns of motors. Messrs. Dennison, Kett and Co.'s City office is at 11, Queen Victoria Street, E.C.

Mainly About Mantel Registers.

Two catalogues received from the Carron Company, of Carron, Stirlingshire, who have London showrooms at 15, Upper Thames Street, E.C., and at 23, Princes Street, Cavendish Square, W., show, respectively, a general list of the firm's goods and a special list of mantel registers of select designs. In the former various kinds of stoves and ranges are included, besides baths and lavatory fittings, and a large number of general castings for house, farm, or garden. In the latter, more than sixty designs are shown of Carron mantel register grates, mantels and overmantels, and mantelpieces. Many of these designs are undeniably handsome, and the collection offers an embarrassment of choice. Chasteness and restraint are observable throughout.

Coming Events.

Thursday, January 21.

Yorkshire Federation of Building Trades Employers.—January meeting, followed by the annual dinner. 6 p.m.

Leicester and Leicestershire Society of Architects.—Address by Mr. W. B. Keites.

Friday, January 22.

Birmingham Architectural Association. — Mr. Arthur S. Dixon, M.A., on "Early Roman Churches."

Royal Sanitary Institute.—Provincial Sessional meeting. Visit to the Manchester Royal Infirmary, 2.30 p.m.; Discussion on "The Manchester Royal Infirmary from the Hygienic, Sanitary and Aesthetic Points of View," to be opened by Mr. Edwin T. Hall, V.P.R.I.B.A., followed by Mr. John Brooke, F.R.I.B.A. 7 p.m.

Architectural Association.—Special general meeting, 7.30 p.m., to consider proposed alterations in the by-laws; also ordinary general meeting, with paper by Mr. J. H. Markham, on "Reinforced Concrete."

Monday, January 25.

University of London.—Mr. Banister Fletcher, F.R.I.B.A., on "Belgian and Dutch Renaissance (and Modern) Architecture." 8 p.m.

Tuesday, January 26.

National Federation of Building Trades Employers.—Meeting of 1908 Council, 10.30 a.m. Meeting of 1909 Council, 2.30 p.m. Both in the Balmoral Room of the Trocadero Restaurant, Piccadilly Circus.

Wednesday, January 27.

National Federation of Building Trade Employers.—Annual general meeting, Trocadero Restaurant, Piccadilly Circus, 10.30 a.m.

Thursday, January 28.

Institute Members' Club.—Meeting in R.I.B.A. Smoking Room, 5 p.m.

Monday, February 1.

Royal Institute of British Architects.—President's Address to Students, and Presentation of Prizes.

Liverpool Architectural Society.—Mr. Mervyn E. Macartney, F.R.I.B.A., on "The Three Churches of St. Paul."

Wednesday, February 3.

Northern Architectural Association.—Ordinary meeting. Paper by Mr. H. Barnes, A.R.I.B.A., 7.30 p.m.

PRACTICAL NOTES
FOR
ARCHITECTURAL DRAUGHTSMEN

BY

A. W. S. CROSS, M.A., F.R.I.B.A. and A. E. MUNBY, M.A., A.R.I.B.A.

Part I. The Orders and their Application.

Part III. Constructional Details.

Plate 17. Domes.
„ 18. Pendentives, Circular Staircases and Wreathed Columns.
„ 19. Gothic Tracery and Vaulting.

Part IV. Perspective.

Plate 20. Notes on Architectural Perspective.
„ 21. Setting up a Perspective.

Part V. Shadows.

Plate 22. Explanatory matter regarding the projection of Shadows.
„ 23 to 27. Examples illustrating Shadows on various architectural details.

"PRACTICAL NOTES" contains a mass of valuable information which it is essential that the Architect should know to enable him to give that harmony, grace and proportion which exemplified the works of Ancient Greek and Roman Artists, many of which are still the admiration of the whole world. It is invaluable to students preparing for the examinations of the R.I.B.A., showing how to draw The Orders correctly with the smallest possible amount of work and study.

Price for Complete Work, 12/-, including Portfolio.

We shall be pleased to forward a copy of this work on approval to any of our subscribers.

THE CENTENARY GAS CO., 11, QUEEN VICTORIA STREET, LONDON, E.C., and 109, Hope Street, Glasgow.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must contorm to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Jan. 22. STONEHAVEN, ABERDEEN. — Mason, carpenter, and slater works, in making alterations on the buildings, at Mill of Catterline, Stonehaven Station, for the Arbuthnott Estate. Plans, specifications, and general conditions of contract can be seen with the tenant, or Davidson and Garden, 12, Dee Street, Aberdeen, with whom offers have to be lodged by Jan. 22.

Jan. 22. DESS, Aberdeen.—Mason, carpenter and slater works to be carried out in connection with the restoration of farm offices at Mill of Dess. Plans, specifications, and general conditions of contract can be seen with the tenant, or Davidson and Garden, 12, Dee Street, Aberdeen, with whom offers have to be lodged by Jan. 22.

Jan. 22. POULTON.—Erection of new buildings in connection with the intended extension of refuse destructor, Gorsey Lane, Poulton, for the health committee of the Wallasey U.D.C., in accordance with plans, etc., prepared by W. H. Travers, A.M.Inst.C.E., district engineer and surveyor, public offices, Egremont, Cheshire. Plans, etc., may be seen, and specification, etc., obtained, at the district engineer's office, on payment of £2.

Jan. 23. ABERDARE.—Erection of 28 workmen's dwellings at Cwmbach, also 22 at Godreaman, for the U.D.C. Plans and specifications may be inspected at the surveyor's office, town hall, Aberdare, between 10 a.m. and 5 p.m., Saturdays 10 a.m. to 1 p.m. Tenders, endorsed "Workmen's Dwellings," are to be delivered by Jan. 23, to Thos. Phillips, clerk, town hall, Aberdare.

Jan. 23. PENKRIDGE (near Stafford).—Erection and completion of a new Council school for about 150 children, and also a cookery room at Penkridge (near Stafford), for the Education Committee. Builders desirous of tendering should apply by January 23, to Graham Balfour, director of education, county education offices, Stafford. Quantities will be supplied on deposit of £1 1s., which should accompany the application to tender.

Jan. 23. MANCHESTER.—Erection of the new municipal secondary school for girls in Chorlton Street, for the Education Committee. Plans may be seen and a copy of the bills of quantities (including specification) obtained at the elementary education office, Deansgate, Manchester, on deposit of three guineas (cheques to be made payable to the accountant). Tenders on the forms provided, addressed to "The Chairman of the Education Committee," must be delivered at the school of technology before noon on Jan. 23.

Jan. 23. FAIRMILE, CHRISTCHURCH.—Erectoin of an infirmary at the workhouse, Fairmile, Christchurch, for the guardians of Christchurch Union. Full particulars, with plans, specifications, and conditions, and a copy of the contract, may be seen at the board room at the workhouse. Persons desirous of tendering may obtain copies of the bills of quantities and forms of tender of the clerk. Tenders, with the names and addresses of sureties proposed, and references as to their sufficiency, with the priced bills of quantities in sealed envelopes, provided, must be delivered by noon on Jan. 29, to A. Druitt, clerk to the guardians. A deposit of £5 is required.

Jan. 25. LITHERLAND.—Erection of a cookery and laundry centre at Lander Road Council School, Litherland, near Liverpool, for the Lancashire Education Committee. Plans may be seen and bills of quantities obtained, at the office of the county architect, Henry Littler, 16, Ribblesdale Place, Preston, by deposit of £2.

Jan. 25. SACRISTON.—Erection and completion of new workmen's club at Sacriston, co. Durham, for the committee of Sacriston workmen's club. Drawings, etc., and conditions of contract may be seen, and forms of tender obtained at the architect's office, 22, Durham Road, Blackhill, co. Durham.

Jan. 25. OMAGH (Co. Tyrone).—Erection of new bank premises at Omagh, County Tyrone, for the directors of the Ulster Bank, Limited. Plans and specification may be seen at the office of the architects. Schedules of quantities may be obtained from W. H. Stephens and Sons, 13, Donegall Square North, Belfast, on deposit of two guineas. Sealed and endorsed tenders to be lodged before 10 a.m. on Jan. 25, with Blackwood and Jury, Ms.R.I.A.I., architects, 41, Donegall Place, Belfast.

Jan. 26. DUKESTOWN, Tredegar.—Erection of a new church at Dukestown, Tredegar. Plans and specifications may be seen at the office of the architect, A. F. Webb, High Street, Blackwood. All tenders to be sent to the architect by Jan. 26.

Jan. 26. BOLGOED, Pontardulais.—Erection of a large villa residence, Bolgoed, Pontardulais. Full particulars may be had from W. Beddoe Rees, architect, 3, Dumfries Place, Cardiff. Plans and specification may also be seen at Pontardulais. Tenders to be delivered by Jan. 26.

Jan. 26. BELFAST.—Erection of an addition to the municipal technical institute, for the corporation. Drawings, etc., may be seen, and schedule of quantities (prepared by S. C. Hunter) and form of tender can be obtained at the office of the architect, Samuel Stevenson, 83, Royal Avenue, Belfast, on payment of £2 2s.

Jan. 26. WIGAN.—Erection of 50 cottages on land adjoining the car sheds, Melverley Street, for the corporation. Plans, sections, specifications, etc., and any other particulars may be obtained on application at the office of the borough engineer, King Street West, Wigan. Sealed tenders, endorsed "Tramway Cottages," must be delivered by 10 a.m. on Jan. 26, to Harold Jevons, town clerk, town clerk's office, Wigan.

Jan. 26. BELFAST.—Erection of an addition to the municipal technical institute, for the Corporation. Drawings and specifications may be seen, and schedule of quantities (prepared by S. C. Hunter), and form of tender, obtained at the office of the architect, Samuel Stevenson, 83, Royal Avenue, Belfast, on payment of two guineas. Tenders, endorsed "Tender for the Erection of the Addition to the Municipal Technical Institute," to be delivered by 11 a.m. on Jan. 26, to Samuel Black, town clerk.

Jan. 27....OTFORD, Sevenoaks.—Execution of certain works at the North Isolation Hospital at Otford, including repairing and re-erection of various temporary buildings, the conversion of one into a discharging block, tar paving and repairs to the hospital, for the R.D.C. Drawings and specifications may be inspected and forms of tender obtained at the office of the clerk. Tenders must be on forms supplied and delivered, sealed and endorsed "Tender for Hospital Work," by Jan. 27, to George F. Carnell, clerk of the council, 130, High Street, Sevenoaks.

Jan. 27. REDNAL.—Erection of a public reading room at Rednal, for the King's Norton and Northfield U.D.C. Bills of quantities and forms of tender may be obtained upon application to the engineer and surveyor to the council, Ambrose W. Cross, A.M.I.C.E., 23, Valentine Road, King's Heath, on deposit of one guinea. Applications for the bills of quantities and forms of tender must be received by Jan. 21, and sealed tenders, endorsed "Tender for Erection of Public Reading Room at Rednal," must reach Edwin Docker, clerk to the council, 10, Newhall Street, Birmingham, by noon on Jan. 27.

Jan. 28. HAMBLEDON, SURREY.—Alterations and additions to an old building in order to provide additional accommodation for aged women at the union workhouse, Hambledon, Surrey, for the board of guardians. Plans and specification of the proposed work can be seen on application to the board's architect, Edward L. Lunn, 36, High Street, Guildford. Sealed and endorsed tenders are to be sent by 9.30 a.m. on Jan. 28, to Ferdinand Smallpeice, clerk to the guardians, 138, High Street, Guildford.

Jan. 29. LONDON, S.W.—Removing the plaster from the ceilings of the men's and women's swimming baths in Manor Street, and substituting therefor 7-8th in. yellow deal or pitch-pine matchboarding for the Metropolitan B.C. of Chelsea, in accordance with the specification, which may be seen at the office of T. Holland, town clerk, town hall, King's Road, Chelsea, S.W., between the hours of 10 and 5 daily (Saturdays 10 to 1). Persons tendering must state separately in their tenders the difference in the cost of the work if carried out in pitch-pine instead of yellow deal. Tenders to be delivered in sealed envelopes, endorsed "Tender for repairs, Public Baths," at the town clerk's office, at the town hall, not later than noon on Jan. 29.

Jan. 30. YORK.—Construction of a temporary timber grand stand (to seat about 5,000 persons) in the gardens of the Yorkshire Philosophical Society, at York, for the Executive Committee of the York Historic Pageant. Drawings may be seen and specifications and quantities obtained from F. W. Spurr, city engineer, Guildhall, Yorks., to whom sealed tenders, endorsed "Grand Stand," must be delivered by Jan. 30. Two guineas to be deposited for specification and quantities.

Feb. 1. CRICKLEWOOD.—Construction of coal bays, fitting and other workshops, stores, lodge, cottages, etc., at Cricklewood, and cottages, etc., at Kempton Park, in the county of Middlesex, for the Metropolitan Water Board. Forms of tender, conditions of contract, specification and bills of quantities may be obtained from the engineer, Staines Reservoirs Communication Works, The Firs, Southern Road, Fortis Green, East Finchley, N., on the production of an official receipt for the sum of £10, deposited with the accountant to the board, Savoy Court, Strand, W.C. Such payments and applications can be made any week day (except Thursdays and Saturdays) between 10 a.m. and 4 p.m. Tenders, addressed to the clerk, Metropolitan Water Board, Savoy Court, Strand, W.C., and endorsed "Tender for Coal Bays, etc., Cricklewood and Kempton Park," must be delivered in sealed envelopes at the offices of the Board, by 10 a.m. on Feb. 1.

Feb. 1. TIDWORTH.—Erection of army ordnance receiving shed, general stores, offices, etc., also clothing, camp and mobilisation stores, at Tidworth. Plans, specification and conditions of contract may be inspected at the office of the director of barrack construction, 80, Pall Mall, London, S.W., or at the barrack construction office, Tidworth, on Jan. 20. Those desiring to tender and to receive a copy of the bills of quantities, must apply to the director of barrack construction not later than Jan. 22. The application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the assistant financial secretary, and crossed "Bank of England for Credit to Army Funds." Tenders, on the form supplied with the bills of quantities, must be delivered in sealed envelopes, marked "Tender for A.O.D. Stores, etc., Tidworth," not later than 12 noon on Feb. 1, addressed to the director of Army Contracts, War Office, Whitehall, London, S.W. The bills of quantities should accompany tender in a separate sealed envelope, similarly addressed, and marked "Bills of Quantities, A.O.D. Stores, Tidworth," with the contractor's name and address thereon.

Feb. 2. LOWESTOFT.—Enlargement of Lowestoft post-office, for the Commissioners of H.M. Works and Public Buildings. Drawings, specifications, and a copy of the conditions and form of contract may be seen on application to the postmaster. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on payment of £1 1s. Tenders must be delivered before noon on Feb. 2, to the secretary, H.M. Office of Works, etc. Storey's Gate, London, S.W., and endorsed "Tender for Lowestoft Post-Office Enlargement."

Feb. 3. BARNSLEY.—Additions to the Barnsley Post Office, for the Commissioners of H.M. Office of Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract, may be seen on application to the postmaster between the hours of 10 a.m. and 4 p.m. Bills of quantities and forms of tender may be obtained at the under-mentioned address on payment of £1 1s. Tenders must be delivered before 12 o'clock noon on Feb. 3, addressed to the secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W., and endorsed "Tender for Barnsley Post-Office Additions."

Feb. 3. LAINDON, Essex.—Erecting iron buildings and making additions and alterations to existing buildings, and other works at the Laindon branch workhouse, Essex, for the Poplar Borough Board of Guardians, in accordance with drawings and specification prepared by the architects, J. and W. Clarkson, 136, High Street, Poplar, E. Drawings and conditions of contract may be seen at the offices of the architects and copy of the specification and form of tender obtained upon deposit to the architects of three guineas. Persons desirous of tendering must send their names to the architects by Jan. 25. Tenders, sealed and endorsed "Tender for Additions and Alterations at the Laindon Branch Workhouse," must be delivered by 6.30 p.m. on Feb. 3, to G. Herbert Lough, clerk to the guardians, 45, Upper North Street, Poplar, London, E. The successful contractor will be required to only employ the men whose names are on a list which will be supplied to him from time to time by the Poplar distress committee, or the Poplar employment exchange. The contractor is at liberty to choose and employ a foreman independently. Fair wages clause. Two sureties required.

Feb. 3. PONTYPRIDD.—Erection of a new building in accordance with drawings and specification prepared by the architect, Vernon Hodge, London, for the building committee of the Pontypridd Y.M.C.A. Drawings, specification, and conditions of contract may be inspected at the present Y.M.C.A. rooms on the site, Taff Street, Pontypridd, on and after ten a.m. on Jan. 21. Copies of the quantities (prepared by the surveyors, C. Pearson Shaw, Son, and Hemingway, Nottingham) can be obtained from the secretary upon deposit of two guineas. Sealed and endorsed tenders, on forms supplied, must be received by Geo. W. Rankin, new buildings secretary, "Bronheulog," Church Place, Penarth, Glam., by noon on Feb. 3.

Feb. 6. TONYREFAIL.—Erection of 60 houses and 6 shops on the Pnysyplwm estate, Tonyrefail, for the Ty'ynycoed building club. Plans and specifications can be seen with Philip J. Jones, architect, Cilfynydd, Pontypridd, and Tonyrefail. Sealed and endorsed tenders to be sent to David Jones, secretary to the Ty'ynycoed Club, Handel House, Cilfynydd, Pontypridd, by Feb. 6.

Feb. 8. PENDLETON.—Erection of a school to accommodate about 388 boys in Wellington Street, Pendleton, for the Salford C.B. Education Committee. Builders desirous of tendering must send in applications for quantities on or before Jan. 20, accompanied by a deposit of £1 1s., to J. B. Broadbent, A.R.I.B.A., architect, 15, Cooper Street, Manchester, at whose office the plans may be seen. Sealed tenders, endorsed "Tender for Wellington Street Boys' School," and addressed to the chairman of the education committee, must be delivered to L. C. Evans, town clerk, town hall, Salford, not later than noon on Feb. 8.

Feb. 8. ARMATHWAITE.—Erection and completion of a mixed school and master's house at Armathwaite, for the Cumberland Education Committee. Contractors desirous of tendering for the whole or any of the several trades are requested to submit names, stating trades, upon deposit of one guinea for a full set of quantities, or half-a-guinea for each separate trade. Quantities and all particulars for tendering will be supplied. Tenders to be delivered to C. Courtenay Hodgson, The Courts, Carlisle, by 10 a.m. on Feb. 8.

Feb. 9. WALTHAMSTOW. — Erection of the proposed higher elementary school (boys' and girls' department) on the Greenleaf Road site, for the Education Committee. Builders desirous of tendering are invited to send their names to H. Prosser, M.S.A., architect to the committee. Drawings and specifications can be seen on and after Jan. 26, between 10 a.m. and 4 p.m. (Saturdays 10 to 12). Applications for bills of quantities must be sent to the architect by 5 p.m. on Jan. 22. A £5 note must be sent with the application as deposit for the bills of quantities. Tenders to be endorsed "Higher Elementary School," addressed to T. W. Liddiard, secretary to the committee, offices, High Street, Walthamstow, and delivered (through the post only), by 3 p.m. on Feb. 9.

ENGINEERING.

Jan. 25. KIDSGROVE.—Supplying and fixing engine, boiler, and pumping plant, for the waterworks at Mow Cop, for the U.D.C.. Further particulars can be obtained from the council's surveyor, F. C. Crimes, Kidsgrove. Tenders to be sent endorsed "Tender for Engine, etc.," by Jan. 25, to John J. Nelson, clerk to the council, Kidsgrove.

Jan. 25. ASTON MANOR.—Fixing of an air compressor, water and air pipes, at the public baths, Victoria Road, Aston Manor, for the Corporation. Bills of quantities and all information can be obtained from F. W. Richardson, borough engineer and surveyor, council house, Aston Manor, on payment of one guinea. Sealed tenders, endorsed "Air Lift Plant," and addressed to the chairman of the baths sub-committee, must be delivered at the council house, Aston Manor, by Jan. 25. Fair wages clause.

Jan. 27-Feb. 6. ORMSIDE, East Westmoreland.—Erection of a bridge and retaining walls, and filling up and formation of road approaches, at Helm Beck, in the parish of Ormside, for the highways committee of the R.D.C. Plans and specifications may be seen at the office of John Kilner, surveyor, Kirkby Stephen, who will attend at the site of the proposed new bridge on Jan. 27, from 11 a.m. to 12 noon, and will give all necessary information. Sealed tenders, endorsed "Helm Beck Bridge," must be delivered at the office of Wm. Hewitson, Appleby, clerk to the council (where also plans and specifications may be seen), by noon on Feb. 6.

Jan. 28. LEWES.—Boring at the workhouse of the Lewes Union, in the parish of East Chiltington. Specifications and form of tender may be obtained on payment of two guineas, from W. Vaux Graham, M.Inst.C.E., 5, Queen Anne's Gate, Westminster, S.W. Tenders, marked "New Boring at the Workhouse," must be sent by first post on Jan. 28, to Charles Patrick, clerk to the guardians, Lewes, Sussex.

Jan. 28. EGG BUCKLAND.—Laying a 1-inch water main and constructing a tank in connection with a water supply at Riverford, in the parish of Egg Buckland, for the Plympton St. Mary R.D.C. Schedules and further particulars may be obtained on application to the council's engineer, F. A. Clark, 83, Old Town Street, Plymouth. Sealed tenders, marked "Riverford Water," must be sent by Jan. 28, to John W. Bickle, solicitor, Temple Chambers, Westwell Street, Plymouth.

Jan. 29. GLASGOW.—Construction of a steel footbridge, across the river Kelvin, within the botanic gardens, for the corporation. Plans, sections and detailed drawings may be seen and specifications and forms of tender obtained on application to the city engineer, city chambers, 64, Cochrane Street. Sealed offers, marked outside "Tender for Steel Bridge, Botanic Gardens," must be lodged by 10 a.m. on Jan. 29, to A. W. Myles, town clerk, City Chambers, Glasgow.

Feb. 1. MIDDLESBROUGH.—Construction of a footbridge over the railway at Cargo Fleet Road crossing, Middlesbrough, for the directors of the North-Eastern Railway. The work comprises about three tons of new steelwork, altering and erecting a pair of girders to be provided by the company, weight about 9 tons, masonry piers and timber steps. Plan and specification may be seen, and detailed quantities and form of tender obtained, on personal application at the office of W. J. Cudworth, the company's engineer, at York. Sealed tenders, marked "Tender for Footbridge at Cargo Fleet Road Crossing, Middlesbrough," must be sent by 9 a.m. on Feb. 1, to R. F. Dunnell, secretary, York.

Feb. 1. WILMINGTON.—Construction and erection of a footbridge over the Hull and Hornsea branch, near Wilmington, for the directors of the North-Eastern Railway. The work comprises about three-and-a-half tons of new steelwork, brick piers, and timber steps. Plan and specification may be seen, and detailed quantities and form of tender obtained, on personal application at the office of W. J. Cudworth, the company's engineer at York. Sealed tenders, marked "Tender for Footbridge over Hull and Hornsea Branch near Wilmington," must be sent by 9 a.m. on Feb. 1, to R. F. Dunnell, secretary, York.

Feb. 4. WOODFOOT, DUMFRIES.—Taking down the existing timber bridge over the river Annan, at Woodfoot, about two miles from Beattock Station, and supplying and erecting a new steel girder bridge of three spans, for the Lockerbie District Committee. Plans may be seen at the office of the engineers, Crouch and Hogg, C.E., 14, Blythswood Square, Glasgow, from whom copies of the specification, schedule of quantities, and form of tender may be obtained on payment of one guinea. Sealed tenders, marked "Woodfoot Bridge," must be lodged by 10 a.m. on Feb. 4, to John F. Cormack, district clerk, Lockerbie District Committee.

IRON AND STEEL.

Jan. 21. LONDON (for Assam).—Supplying steel rails and fishplates, for the Assam-Bengal Railway Co. Specification and tender forms may be obtained from the offices of the Company, Bishopsgate House, 56, Bishopsgate Street Within, London, E.C. A fee of one guinea is charged for each specification, which cannot be returned. Tenders must be delivered at the company's offices by noon on Jan. 21, to F. A. Lyall, secretary.

Jan. 21. PLYMOUTH. — Supplying for the period of one year:—Fire hydrants, lead pipe and pig lead, stopcocks, ferrules, etc., cast-iron work, sluice valves, for the Corporation. Particulars and forms of tender can be obtained at the office of the water engineer. Tenders enclosed in envelopes provided to be delivered by noon on Jan. 21, to Frank Howarth, M.Inst.C.E., water engineer, municipal buildings, Plymouth.

Jan. 22. ROTHERHAM.—Supply and delivery of cast-iron pipes and irregularly-shaped pipes and castings, as may be required during the year ending December 31, 1909, for the Corporation. Specifications, forms of tender and drawings may be obtained at the office of Ernest B. Martin, A.M.I.C.E., waterworks engineer, town hall, Rotherham, on deposit of £1 1s. Tenders, endorsed "Tenders for Cast-Iron Pipes," must be forwarded by 10 a.m. on Jan. 22, to W. J. Board, town clerk, town hall, Rotherham.

Jan. 23. SWINTON AND PENDLEBURY. — Supply and erection of swings, and the supply and erection of wrought-iron fencing at the Moorside recreation ground within the district, for the U.D.C. Plan may be seen and specification and forms of tenders obtained on application to Henry Entwistle, council offices, Swinton, Manchester, between 9.30 and 11 o'clock a.m., on deposit of a cheque for 10s. 6d., payable to W. T. Postlethwaite, clerk to the council, council offices, Swinton, Manchester. Sealed tenders to be returned in envelopes provided by Jan. 23.

Jan. 23. SOWERBY BRIDGE.—Supplying 20 tons of 6 in. cast iron spigot and socket pipes, tested, coated and delivered at Sowerby Bridge, as required for the U.D.C. Specification, forms of tender and any other information can be obtained on application to John Hopkinson, waterworks engineer, at his office, Town Buildings, Sowerby Bridge, up to Jan. 20, between 9 a.m. and 10 a.m. Sealed tenders, endorsed "Tender for Water Pipes," to be delivered by Jan. 23, to R. W. Evans, Commercial solicitor and clerk to the council, Commercial Bank Chambers, Halifax. (See also "Miscellaneous.")

Jan. 26. YNYSCYNHAIARN. — Supplying (1) about 150 tons 3in. to 8in. cast or steel gas main and fittings; (2) about 90 lanterns and incandescent burners. Specifications and forms of tender can be obtained from Jno. Jones, clerk to the council, town hall, Portmadoc, on payment of £1 1s. for each copy. Tenders, endorsed "Tender for ——," to be delivered by Jan. 26.

Feb. 1. NEATH.—Supplying cast-iron pipes of 18 in., 16 in., and 15 in. diameter respectively, with special castings, of similar sizes, valves, and fittings, for the waterworks committee of the R.D.C., to be delivered to Hirwain Station consigned to Ystradfellte Waterworks. Detail drawings, specification, schedule of quantities, and form of tender may be obtained upon application to D. M. Davies, engineer, council offices, Neath, upon receipt of cheque for three guineas. Sealed tenders, endorsed "Tenders for Pipes, Valves, etc., Ystradfellte Waterworks," must be addressed to the chairman of the waterworks committee, and delivered by Feb. 1, to Cuthbertson and Powell, clerks to the council, 58, Water Street, Neath.

PAINTING.

Jan. 25. ASTON MANOR.—Painting, and decorating the public swimming baths, Victoria Road, Aston Manor, for the corporation. Specification and all information can be obtained from F. W. Richardson, borough engineer and surveyor, council house, Aston Manor, on payment of one guinea. Sealed tenders, endorsed "Baths Painting," and addressed to the chairman of the baths sub-committee, must be delivered at the council house, Aston Manor, by noon on Jan. 25. Fair wages clause.

PLUMBING & SANITARY

Jan. 21. TYNEMOUTH.—Laying about 2,000 yds. of 9 and 12 inch pipe sewers, together with the construction of necesssary manholes, etc., flush tank, and outfall arrangements, at Bigges Main, near Long Benton, for the Tynemouth R.D.C. Plans and specifications may be seen at the office of A. S. Dinning, 21, Ellison Place, Newcastle. Tenders, sealed and endorsed "Bigges Main Sewers," to be sent by noon on Jan. 21, to A. Whitehorn, clerk to the R.D.C., 60, Saville Street, North Shields.

Jan. 22. MANCHESTER.—Execution of the work named in the undermentioned streets, for the paving, sewering and highways committee: Sewering, draining, paving, etc., Buckley Street, from Fairfield Road to Edward Street, and from Rock Street to Wheler Street, Openshaw. Sewering and part draining Cooper Street, from Schofield Street to Fargher Street, Clayton. Draining, paving and flagging Birch Hall Lane, from Dickenson Road to a point 122 yards distant in a south-westerly direction, Rusholme. Forms of tender may be obtained on application to the paving, etc. department (surveyor's office), and must be returned to the chief clerk, paving, etc. department, town hall, Manchester, by 10 a.m. on Jan. 22.

Jan. 27. HAMPSTEAD HEATH, N.W.—Supply and delivery of agricultural drain-pipes at Hampstead Heath, for the L.C.C. Persons desiring to submit tenders may obtain the specification, form of tender, and other particulars at the Parks Department, 11, Regent Street, S.W. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for drain pipes, Hampstead Heath." No tender received after eleven a.m. on Jan. 27 will be considered.

Jan. 27. LLANTRISANT AND LLANTWIT FARDRE.—Execution of the following works, for the R.D.C. (a) For widening and improving a portion of the district road between Efail Isaf and Pont Lydan, including excavations, filing, forming, banking, and fencing, ballasting, metalling, etc. Length about 57 lineal yds. (b) Widening and improving a portion of the district road between the electric power station and upper boat bridge, including excavations, filling, forming, banking and wire fencing, ballasting, metalling, etc. Length about 390 lineal yds. (c) Sewer extension at Trebanog, including the provision and laying of about 110 lineal yds. of 6 in. dia. stoneware pipes, the construction of manholes, and other incidental works. (d) Construction of sewerage and sewage disposal works for the village of Efail Isaf. The sewerage works include the provision and laying of about 250 lineal yds. of 9 in. dia. and 1,395 lineal yds. of 6 in. dia. stoneware and cast iron pipes, together with the construction and erection of all manholes, lampholes, ventilating columns, etc. The sewage disposal works consist of the construction of grit chamber, feed, septic and measuring tanks, percolating filter, and effluent irrigation drains and effluent outlet chambers. Specifications may be seen, and bills of quantities and forms of tender obtained from Gomer S. Morgan, surveyor, School Street, Pontyclun, upon deposit of £1 for each contract. Sealed tenders must be deposited at the office of the clerk to the council, W. Spickett, solicitor, Pontypridd, before 10 a.m. on Jan. 27.

A British School of Architecture in Italy.

In the opening address delivered by the President of the R.I.B.A. in November last, reference was made to the desirability of enabling art students of this country to join a school, at Rome or elsewhere in Italy, in which "young painters, sculptors, and architects could fraternise, help one another, and receive some guiding direction in the profitable study of great works." So far as the interests of the art of architecture in this country are concerned, nought but good could result from the formation of a school of the nature indicated, provided the course of study were placed under the control of a thoroughly suitable man. But nothing short of the adoption of the methodical and systematic course of training to be obtained at the Beaux Arts in Paris will suffice to meet the growing wants of the large number of English students who are now devoting their time and energy to the acquisition of knowledge connected with an art which is, at the present time, all but a lost one. Unfortunately, owing entirely to their lack of efficient training, few architects of to-day are able to realise how supremely important it is to the welfare of the profession in general that our students of architecture should be afforded the means of obtaining a course of artistic study as thorough and definite in its characteristics and aims as that enjoyed by young architects in other countries. Were it otherwise, a National College of Architecture, subsidised by and encouraged by the Government, would long ago have been founded, with the object of enabling English architects to become thorough masters of their art. So-called "schools of architecture" (in which young men may obtain a sufficient knowledge of building construction and the elements of design to enable them to earn a more or less precarious livelihood in the subsequent practice of architecture) abound in profusion, but it is, to say the least, extremely doubtful whether they do much, or are intended to do much, for the advancement of the *art*. Indeed, in our judgment, the utility of many of the existing educational centres may be gauged by the fact that they sometimes succeed in imparting to the shrewd man of affairs that modicum of architectural learning and architectural skill which is often, in these days, sufficient to enable him to acquire a profitable architectural practice in which *architecture* usually plays a very subordinate part. The ideal school of architecture would be one conducted under the auspices of the architects in *actual practice*, whose experience and artistic attainments are of a nature to entitle them to speak with authority on what Mr. Blomfield calls "The Mistress Art." That these directors of architectural education should themselves be in all cases sufficiently well trained in the essentials of their profession to enable them to inculcate, in the minds of students, the *true* principles of the art of design—including the fundamental rules of monumental planning and a due appreciation of the value of proportion, symmetry and refinement—goes without saying, for otherwise they would prove unsafe guides for the embryo architects whose artistic education they may be called upon to direct and control. We look forward with a considerable amount of interest to the day when the Council of the Royal Institute of British Architects will be in a position to give reality to a suggestion which, *prima facie*, appears to us to be one of great value to the cause of architectural education in this country.

Psychological Phenomena.

Haunted houses are only too common; and, given an historical mansion, a properly constituted ghost is a valuable asset when the property comes into the market. The wealthy parvenu purchaser—especially if he comes from the other side of the Atlantic—expects that the upset price will include the family ghost, if not the family ancestors. But a ghost in an architect's office is "not so estimable, profitable neither," especially when it begins to play pranks with the goods and chattels; and some such supernatural agency is perhaps intended to be inferred from the circumstances recorded in the following paragraph, which appears in a Manchester newspaper: "[Blanktown] police have a rather curious matter in hand. The staff in a local architect's office is considerably puzzled by the fact that on several occasions the furniture and other things have been piled in a heap in the centre of one of the rooms during the night. A special watch was kept, but the same thing occurred." Motives of delicacy have prompted us to disguise the name of the town. Not but what such things are likely to occur in the best-regulated office; and where the staff is large, the opportunities for mischief and the chances of the "spook" escaping detection are greatly multiplied. The architect—of whose identity we have not the remotest idea—was doubtless wise in appealing to the police rather than to the Psychical Research Society. A spook whereof we had experience in our salad days showed almost diabolical and quite inexhaustible ingenuity in varying the means of annoying everybody in the office. One day the red ink would be emptied into the gum-pot; the next, this interesting but unhelpful process would be exactly reversed. Another time, every office coat would have its sleeves stitched up. Anon, numberless carefully-assorted documents would be hopelessly mixed and disarranged, driving everybody to distraction. This kind of thing went on for years, until the most grave and sedate of the senior assistants, who was always conspicuously one of the chief sufferers from these booby tricks, left the office to start on his own account. Then the annoyance suddenly and completely ceased. It is seldom or never the youth of irrepressible high spirits who practices these despicable subtleties. In houses where the crockery jumps and rattles without visible human agency, chains clank, and doors fly open, the "spook" is often discovered in the most demure, timorous, and least suspected member of the household—some "smug" with a mean and morbid passion for slyness and mystification. That is the kind of youth who should be most closely watched when similar manifestations occur in an architect's office. But the statement that "a special watch was kept, but the same thing occurred," does not increase the credibility of the paragraph.

Architectural Gardening.

The other day, Mr. Joseph Cheal, of Crawley, delivered, at a meeting of the Italian Circle of the Lyceum Club, a fascinating lecture on "The Old Gardens of Italy." He showed that the Italian love of gardening is traditional. Roman generals brought home glowing accounts of the gardens of Assyria, Babylonia, and Egypt, and it was their accounts, probably, that fired the emulation of Lucullus, whose magnificent garden at Naples is described by Pompey. Early in the second century, the Emperor Hadrian showed a nice taste in horticulture; and Pliny the Younger, at about the same period, not only designed gardens, but left descriptions of them. Lorenzo de Medici did much in the creation of beautiful villas and gardens round Rome and Florence; and, at the Renaissance, senators and church dignitaries vied with each other in the making of gardens, many of which have survived to the present time. Gardening, it may be added, has been cultivated from the most ancient times in India and China. It was, of course, the Romans who introduced gardening into Britain. On their retirement it fell into decay, and was revived by the monks. Later, the laying out of the monastic grounds was imitated around the principal castles; and it may be supposed that these early gardens, with their arbours, fountains, trim hedges, and grassy seats, were not wholly deficient in architectural character. About the fifteenth century, it was customary to introduce raised mounds, which were sometimes elaborately constructed of stone or brick. By the seventeenth century, pleasure-gardening had reached a high level of cultivation; but the formal gardening that had been prevalent up to the time of Queen Anne was ridiculed by the wits—Pope and Addison, for instance—and was superseded by the landscape gardening of which Bridgeman, Kent, Batty Langley, and "Capability" Brown became notable exponents, when stately avenues and terraces were abolished in favour of a rather ridiculous so-called "imitation of nature." Even sham ruins were erected by disciples of this school. The most notorious example of the gardener turned architect is, of course, that huge conservatory the Crystal Palace; but this, after all, is but an inconsiderable revenge for the innumerable instances in which architects have devised gardens. The general lay-out and the structural features are surely well within the province of architects, who, to judge from sundry indications, are beginning to pay increasing attention to the subject. Not long ago, an entire issue of one of the American architectural magazines was devoted to architectural gardening; and one or two English architects are delivering lectures on the subject. The spread of the garden city movement has probably given an impetus in this direction; and it seems to us to be perfectly obvious that, the garden being an adjunct to the building, the architect is indisputably the proper person to plan it, and that he can do this without in any degree trespassing on the functions of the gardener, who, in these days, has become a very respectably scientific specialist in his own line, and who, to his credit, usually recognises that all that pertains to architecture should be left to the architect.

* * *

Leeds Workhouse Extension—A Knotty Question. The Leeds Guardians have had a rather difficult problem to solve. They are about to build a new workhouse block, and their workhouse committee recommended that, as the late Mr. Thomas Winn had conceived the extension scheme, the work should be given to his firm. To this proposition an amendment was moved, to the effect that competitive plans should be invited. To this amendment it was objected that the Guardians were under a moral obligation to give the work to Mr. Winn's firm, and that, since the Board knew exactly what was required, it would be a waste of effort to invite competitive plans—that, in fact, Messrs. Winn's sons, having been in touch with the scheme from its inception, and having been already consulted with respect to the ground plan, were in the best possible position to meet the requirements of the Board of Guardians and of the Local Government Board. These were strong arguments, but they did not prevail. The opponents of the proposition admitted that the firm in question had always done their work exceedingly well, and that there was nothing to be said against them; but some of the Guardians thought that the Board's work ought to be distributed—that other architects ought not to be excluded from a chance of doing the work. One speaker said that he would like the Board to follow the example set by the Government when they wanted to extend the British Museum. For that work the R.I.B.A. were invited to submit the names of half-a-dozen architects. Could not the Board follow this example, and ask the Leeds Architectural Society to submit six names? This suggestion was ridiculed. "Why should not the Board make its own appointments?" The answer to this naïve question would be more easy than complimentary; but it may perhaps be asked, without offence, "If the Government did not disdain expert advice, why should the Leeds Board of Guardians show less modesty?" In the end, it was decided by fifteen votes to nine, that local architects who were desirous of doing the work should be invited to send in their names. Taking all the circumstances into consideration, so far as they are revealed in the newspaper report upon which we are dependent for the particulars that are here impartially summarised, this decision seems to bear somewhat hardly on the firm that had apparently been led to entertain a reasonable expectation of getting the work; but if they obtain it in competition, their position will be far more satisfactory all round.

* * *

The Apprenticeship Problem. The apprenticeship question is assuming considerable importance, both in this country and in France. Our National Federation of Building Trades Employers is giving it very earnest consideration; and we now learn that the permanent mixed commission of the building industries of France has decided upon taking certain definite steps towards placing the matter on a truly national basis. Last August it was agreed to confer with various trade organisations as to the desirability of holding a national congress on the subject—the "crisis," it is called in the French newspapers—and the response has warranted a definite arrangement. Nearly 400 organisations, of employers and of employees, Parisian and provincial, have signified their interest in such a congress, and it has been therefore decided to hold a "National and General Congress of Industry, Commerce, and Labour," which will take place at the Salle d'Horticulture, 84, Rue de Grenelle, on April 19th, 20th, and 21st next, and it may be useful to note that all communications on the subject should be addressed to MM. Bertin and Vergoz, general secretaries of the Congress, 30, Rue Beaubourg, Paris; and that the treasurer is M. Soulé, president of the French National Federation of Builders, 13, Rue de Thorigny. The proceedings of this congress will certainly be watched with sympathetic interest from this side of the channel; and if the sanguine anticipations of the organisers that the congress will be able to solve the problem once for all, are not realised, it is at least probable that a congress so liberally constituted will be able to contribute something material to our knowledge of industrial economy.

THE R.I.B.A. PRIZES AND STUDENTSHIP AWARDS.

The collection of drawings submitted in competition for the R.I.B.A. prizes and studentships for the current year, and now on view at the gallery of the Alpine Club, will well repay a visit. Although as, unfortunately, is too often the case, the quality of the draughtsmanship is, in the majority of instances, much superior to that of the designs, yet it must be conceded that on this occasion one or two very fair examples of the real art of the architect have been received.

The Institute silver medal and the sum of ten guineas for the best set of measured drawings of any important building, Classical or Mediæval, in the United Kingdom or abroad, have been awarded to Mr. Ernest W. Wray, of York, who exhibits some carefully prepared geometrical drawings of the Church of the Madonna di San Biagio, Montepulciano, a well-known building designed by Antonio San Gallo the elder, in 1518. The half-inch scale drawings and the sheet of full-size mouldings, are good examples of painstaking draughtsmanship, and the section is particularly interesting on account of the somewhat unusual character of the internal treatment of the church, which includes a single massive Doric order and entablature, terminating at the springing of the vaulted roof.

Mr. Alan G. Brace, of Lapworth, Warwickshire, receives a medal of merit for an excellent set of drawings of Lavenham Church, Suffolk. Although we intended to limit our remarks to the works submitted by the successful competitors, yet we feel bound to call attention to the particularly fine drawings of Greenwich Hospital, exhibited under the motto *Metopemania*. The Soane medallion and the sum of one hundred pounds, for the best design for a casino on the borders of a lake, are taken by Mr. Anthony R. Barker, of Harrow, whose well-planned, but rather florid, design is shown to advantage in a good set of drawings, the weakest of which is the half-inch scale detail. An attractive perspective, in water colour, accompanies the geometrical drawings. The design submitted by Mr. Adrian Berrington, of London, which receives honourable mention and the sum of £21, is an exceedingly able one, and its architectural treatment appears to us to be far more suitable and appropriate to the subject than that to which the first place has been awarded. The cleverly rendered perspective sketch shows that its author possesses much artistic power.

The Pugin Travelling Studentship, founded for the promotion of the study of the Mediæval architecture of Great Britain and Ireland, has been secured by Mr. Sydney H. Miller, to whom a silver medal and the sum of £40 have been awarded. Mr. Miller submits some of the very best drawings which have been received in competition for the Pugin studentship for many years past, and all of his examples, in addition to being well drawn, are well chosen.

Among other beautiful works we noticed a fine pencil rendering of a bay from the Presbytery, Ely—a measured sketch, accompanied by quarter scale details, of the Sedilia at Hawton Church, and perspective views from the Chapter House, Southwell, Leverington Church, Pershore Abbey, Magdalen College, Oxford, and drawings of the charming sanctus bell-cot at Walpole St. Peter's, Norwich.

Mr. H. Hubert Fraser, who has been awarded the sum of £10 10s., has also submitted an excellent set of drawings, among which we noticed a particularly good work, in pencil, illustrating the sepulchre at All Saints' Church, Hawton, Notts., and many other interesting examples, including a large scale detail drawing, in colour, of the Church of SS. Peter and Paul, at Knapton, Norfolk, measured drawings of the porch of Southwold Church, a coloured view of Heckington Church, Lincoln, and drawings of the stained glass from one of the windows in All Saints' Church, York.

The Owen Jones studentship for the encouragement of the study of architecture (more particularly in respect to ornament and coloured decoration), has not been awarded, there being only one set of drawings submitted, for which Mr. S. Herbert Maw receives the sum of twenty guineas in recognition of the merit they display. The works are interesting evidence of their author's industry, which, however, does not appear to have been altogether well applied. The subjects selected for illustration include the elaborately decorative ceilings of the Scala D'Oro and the Scala di Collegio of the Ducal Palace, Venice, and large scale coloured drawings of the Corsini Chapel of S. Giovanni in Laterane, Rome.

The Tite prize, consisting of a certificate and thirty pounds, for the best design (according to the principles of Palladio, Vignola, Wren, or Chambers), for a covered arcade of shops, is carried off by Mr. Richard W. M. Gunn, of Glasgow, and in the same competition the designs of Mr. Bertram Edwin Lisle, of Wandsworth, and Mr. S. Herbert Maw, of Hull, receive special prizes of £15 15s. and £10 10s. respectively.

Mr. Gunn submits some charming drawings delicately rendered in pencil. The internal treatment of the scheme is excellent, but the facade to the streets can scarcely be regarded as a successful effort of design. The perspective view is beautifully drawn, and the half-inch scale detail is another fine example of good draughtsmanship.

Mr. Lisle's very able and practical design runs the selected one very closely in everything but draughtsmanship. Its internal treatment is simple and appropriate, whilst externally his elevation is superior to that awarded the first place, although the small blocked columns of the entrance are out of scale with the main order. Mr. Maw's drawings are wonderfully well executed, but his planning is rather weak.

The Grissell prize, consisting of a gold medal and a sum of ten guineas, for the encouragement of the study of construction, has been awarded to Mr. Douglas William Day, of Leicester, for his design for a landing stage forming the principal approach to a royal palace.

The successful competitor submits a good constructional drawing of the inner and outer dome of his excellent scheme, which, though perhaps worked out on a far more ambitious scale than the conditions suggested, is, in point of merit, far superior to any of the very poor designs submitted by his rivals.

The Arthur Cates prize is taken by Mr. Leslie Wilkinson, who sends a fine collection of masterly works, some of which, as, for example, a design for a British Embassy, have done duty elsewhere. Among the exhibits are some good measured drawings from St. James' Church, Piccadilly—a tinted sketch of the doorway of St. John's College, Oxford, a measured sketch of the Gran Guardia Vecchia, a charming water-colour of the Campanile de la Palazzo, Verona, a sheet of diagrams of constructional masonry, and sketches of St. Mark's, Venice, the Radcliffe Library, Oxford, and other well-known buildings.

The Godwin Bursary and Wimperis bequest, consisting of a silver medal and the sum of sixty-five pounds, founded for the promotion of the study of works of modern architecture abroad, has been awarded to Mr. J. A. Allan, who submits a portfolio of working drawings of Ruthrieston School, Aberdeen, and five sheets of detail and other drawings, and photographs of school buildings at home and abroad.

The Institute silver medal and twenty-five guineas for an essay on "The Influence of Architecture of Modern Methods of Construction" have been awarded to Mr. Henry A. Hill, B.A., of Bayswater, W., the sum of ten guineas to Mr. Horace Cubitt, and honourable mention to Mr. J. MacLaren Ross.

The successful essayist touches upon the development of architecture during the last hundred years, which he regards as the result of "Utilitarian æsthetic and structural influences," and refers, as illustrations, to many recently-completed London buildings, such as Dewar's, Mappin and Webb's; and with reference to the latter, the author remarks, "one may or may not like this very original fantasia upon Classic motives so totally regardless of Classic forms."

Architectural Societies.

R.I.B.A.

In the discussion on the paper on "Public Abattoirs," read by Mr. R. Stephen Ayling, F.R.I.B.A., before the Institute, on January 18th (see p. 53 of our issue of January 20th),

Mr. SYDNEY PERKS said he had understood Mr. Ayling to observe that London did not possess a single public abattoir, but he (Mr. Perks) would like to remind him that there was one such at Islington, opened a little over a year ago, and upon which the Corporation of London had expended from £30,000 to £40,000. Here there were a fully-qualified veterinary surgeon, and a staff of assistants. A large party of municipal authorities had visited many of the chief foreign abattoirs, and, upon comparing them with the one at Islington, had pronounced emphatically in favour of the latter.

Mr. J. C. NICHOL said that from impressions gained while visiting the important continental slaughter-houses, some ten years ago, he rather sympathised with the remarks of Mr. Perks. Nevertheless, the lecturer was to be congratulated upon putting together intelligibly a large amount of information that must have been difficult to obtain. In his (the speaker's) opinion, the great point in slaughter-houses was the design; but it would be ill-advised policy to follow the French system of planning. Most of the abattoirs at Paris were built upon precisely the same plan, and this method could not possibly apply to London, or to our provincial towns. The Birmingham Corporation had erected a slaughterhouse upon a restricted area of ground, and had tried the experiment of placing the stables on top of the house, a method of construction that had proved very satisfactory. Turning to another aspect of Mr. Ayling's paper, he had failed to observe any expression of offence in the eye of an animal, upon witnessing the death of a fellow. He knew that blue spectacles placed over the animals' eyes, and many other devices, had been variously adopted, but had constituted a hindrance rather than a help to the slaughterer in the execution of his work. He strongly advocated the con-

GIRLS' NEW HIGH SCHOOL, GLOUCESTER: MAIN CORRIDOR. WALTER B. WOOD, A.R.I.B.A., ARCHITECT.

struction of slaughter-houses under one continuous roof.

Mr. NIXON HORSFIELD proposed a cordial vote of thanks to the lecturer for his exceedingly meritorious and instructive paper.

Mr. ERNEST GEORGE briefly commented upon the discussion.

Mr. STEPHEN AYLING, replying to the vote of thanks, said, with respect to Mr. Perks's remarks on the Islington building, that that was not what he understood to be a public abattoir. It was built by the City Corporation, and the expense was not defrayed out of the rates. He did not advocate the building of abattoirs in central London, but rather in the suburbs, where there was plenty of room. He had not mentioned the provincial abattoir, this being a side issue, but he believed that were a line to be drawn from the Wash to the South of Wales, fully nine-tenths of the abattoirs would be found above, and the remaining one-tenth below that line.

The designs and drawings submitted for the Institute prizes and studentships have been placed on exhibition in the gallery of the Alpine Club (entrance in Mill Street, Conduit Street, W.). The awards, as read at the Council's meeting on January 18th, were published in our issue of January 20th. It should be added that. for his five strainers of Lavenham parish church Mr. Alan G. Brace received a certificate of hon. mention and books to the value of five pounds.

The Council, on the recommendation of the Board of Examiners (architecture), have awarded the Ashpitel prize (books value £10) to Mr. Horace James Ash, of Nuneaton, who was registered probationer in 1893, student in 1902, and passed the Final examination in November, 1908.

The Council have approved the drawings executed by Mr. Harold Cooper, the Soane medallist of 1907, who travelled in Italy, Switzerland, and France; also the work of Mr. Arthur R. H. Jackson, the Owen Jones student of 1907, who travelled in Northern Italy, Greece, and Turkey; also the work of Mr. G. Salway Nicol, the Tite prizeman of 1907, who travelled in Italy; and the drawings of Mr. Sydney G. Follett, the Pugin student of 1908, who travelled in Northamptonshire, Lincolnshire, Oxfordshire, Worcestershire, Gloucestershire, Wiltshire, and Somersetshire.

Manchester Degrees in Architecture.

A prospectus of the Manchester School of Architecture, which has been established pursuant to arrangement between the University of Manchester, the Manchester Education Committee, and the Manchester Society of Architects, shows that the director is Professor Capper. M.A., A.R.I.B.A., who has for coadjutors. Mr. J. Lindsay Grant as lecturer in architecture, Mr. R. Glazier, A.R.I.B.A., headmaster of the Municipal School of Art, and other members of the staff of that school, of the Municipal School of Technology, and of the University; while Mr. W. Leicester, M.S.A., is lecturer in building construction. Members of the advisory committee, as representing the Manchester Society of Architects, are Mr. Paul Ogden, F.R.I.B.A., and Mr. J. H. Woodhouse, F.R.I.B.A. The visitors nominated by the R.I.B.A. are Mr. Mervyn Macartney, M.A., F.R.I.B.A., and Mr. J. Slater, B.A., F.R.I.B.A. The University offers two degrees to students of architecture—(1) In the faculty of arts, the degree of Bachelor of Arts with honours in architecture; (2) in the faculty of technology, the degree of Bachelor of Technical Science.

The subjects of the matriculation examination are —(1) English language or literature; (2) English history; (3) mathematics; (4) three of the following (one of which must be a language): i. Greek, ii. Latin, iii. French, iv. German, v. some other language approved by the Board, vi. mechanics or physics, vii. chemistry, viii. geography (physical, political, and commercial), ix. natural history (plants and animals).

The intermediate examination includes the following subjects:—A.—For the degree of B.A.: (a) Greek, Latin, French, German; (b) ancient history, modern history, English literature; (c) physics, pure mathematics, applied mathematics. B.—For the degree of B.Sc.Tech.: (a) Mathematics, (b) physics, (c) a language (other than English).

The final course for the degree of B.A. or B.Sc.Tech. includes the following subjects: A.—For the degree of B.A. and B.Sc.Tech.: 1, History of architecture: (a) general architectural history; (b) Renaissance and modern architecture. 2, Architectural construction: (a) Building construction and sanitation (surveying may be taken as an additional subject); (b) graphic statics, theory of structures, strength and testing of materials. 3, Architectural design: (a) Freehand and architectural drawing; (b) thesis with memoir; (c) oral examination (if required). 4, Architecture (special). Additional subjects for the B.A. are:—Two of the following, one of which must be (a) or (b):—(a) general history of art; (b) history of classic art; (c) advanced freehand drawing; (d) measured drawing of a building, with memoir; (e) modelling; (f) decorative design. Additional subjects for the degree of B.Sc.Tech. are:—Applied mechanics and graphic statics, special architectural construction, surveying, chemistry. The final examination is arranged in two parts, both of which, however, may be taken together at the end of the final year. Candidates who have obtained the University degree in architecture are exempted by the R.I.B.A. from all but the final examination qualifying for A.R.I.B.A.

Further particulars may be obtained from Messrs. Sherratt and Hughes, publishers to the University, 27, St. Ann's Street, Manchester.

Proposed New Works.

BARNES, SURREY.—The District Council has approved plans for the following:—Five shops, Sheen Lane, Mr. W. Connock; alterations to 161, Castelnau, Messrs. Boon and Porter; and alterations to 206, Upper Richmond Road, Mr. T. Jones.

BRIDLINGTON.—The Town Council are applying to the L.G.B. for a loan of £10,670 for the new Burlington schools. The subcontractors are:—For excavating, bricklaying, and plastering, Mr. John Sawdon, builder; mason, Mr. Preston; slater, Messrs. Dawber and Co.; carpenter, Mr. Moore; ironmonger, Messrs Everingham; plumber and electrician, Mr Jarvis; painter, Mr. Siddall; heating, Mr. W. A. Nettleship.

CARDIFF.—The Board of Education have approved the plans for a new intermediate school, and the building committee will invite tenders for its erection without delay.

LEIGH-ON-SEA.—The Urban Council have passed plans for the erection of new Council Offices, and are to apply to the L.G. Board for a loan of £4,500 to carry out the works.

LONDON: KENSINGTON GORE.—A fund has been opened for the erection of a reredos in Holy Trinity Church as a memorial to the late G. F. Bodley, R.A. Holy Trinity Church was one of the last churches designed by Mr. Bodley, and the reredos proposed to be erected was designed by the late distinguished architect, but not carried out for want of funds.

LONDON, W.—An extensive building proposal, estimated to cost £250,000, is in contemplation by William Whiteley, Ltd., who have offered the Paddington Council £60,000 for the freehold of the Queen's Park baths and wash-houses.

RICHMOND, SURREY.—The Town Council have approved the following:—Mr. Edwin Evans, ten dwelling houses in Burlington Avenue; Messrs. Watney, Combe, Reid, and Co., rebuilding of the "Beehive" public-house, Lower Richmond Road.

STONE, KENT.—It is proposed to ask the County Council to erect a new school here

SOUTHEND-ON-SEA.—The Town Council have approved plans for the following:—Four houses, Crowstone Road and South Avenue, Westcliff, J. Bane; one house, Bournemouth Park Road, William Steel; house, stable, etc., rear of Southchurch Road, corner of Milton Street, H. J. Kelly, M.R.C.V.S.; one house, Imperial Avenue, J. Rothschild; two houses, Chalkwell Gardens, corner of Sandleigh Road, Charles May; two houses, Westborough Road, G. H. Griffiths; two houses, Hill Road, A. W. Knights; one house, Undercliff Gardens, J. Crossland; one house, Cliff Road and Sea View Road, F. Bradford; one house. Westborough Road, T. Lawford; six houses, Surbiton Road, J. Goldsworthy; one house, Southchurch Beach Parade, T. Cooper; two houses, Whitefriars Crescent, A. S. Barley; one house, Whitefriars Crescent, J. Batchelor; bungalow, Southbourne Grove, D. E. Kerridge; bungalow, Fairmead Avenue, D. E. Kerridge; two houses and shops, Hamlet Court Road, corner of St. John's Road, John Jones; one house, North Avenue, C. Cade; additions, 29, Dowsett Avenue, Dr. J. B. Maxwell; house and shop Leigh Road East, B. Flory; two houses, Eastwood Road, J. Sears.

WALLSEND.—A new parochial hall for St. Luke's Church is to be built, and funds are now being collected.

WINCHESTER.—A new County school for girls is to erected here at a cost of £8,475. A site has already been secured from the Ecclesiastical Commissioners.

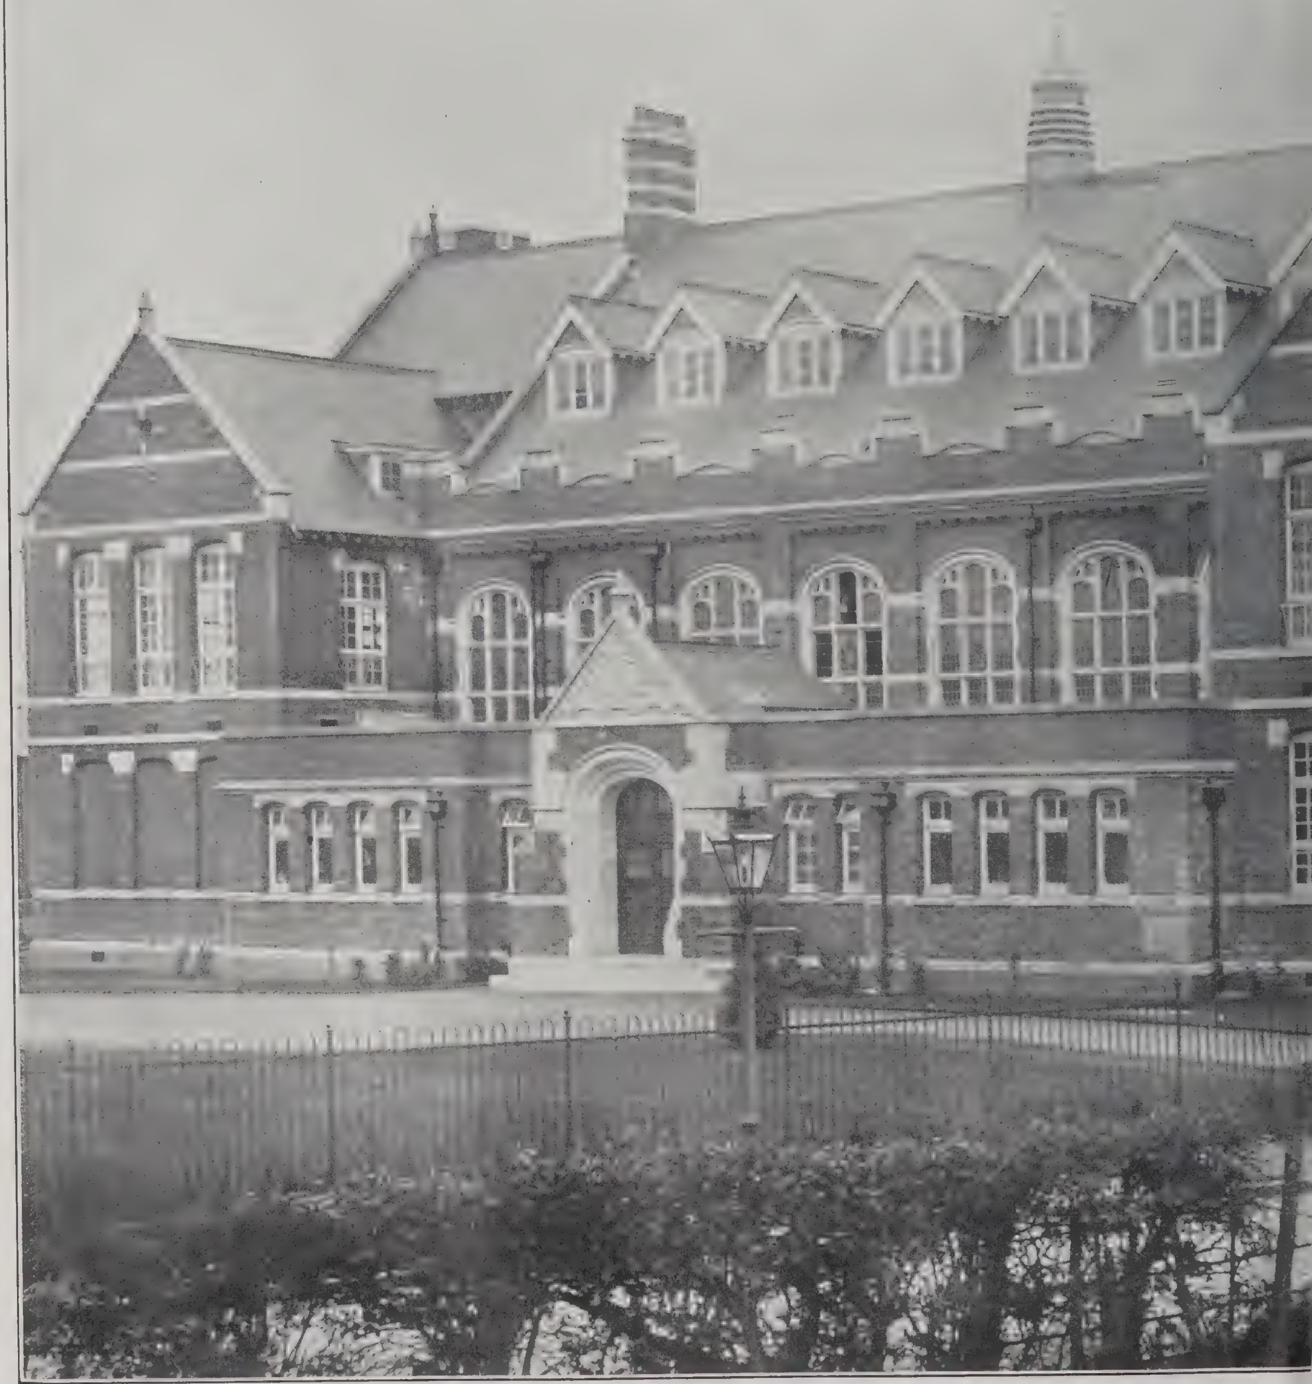
WOLSINGHAM.—Plans submitted by the Surveyor to the Weardale R.D. Council for a new secondary school here have been approved.

Our Plate.

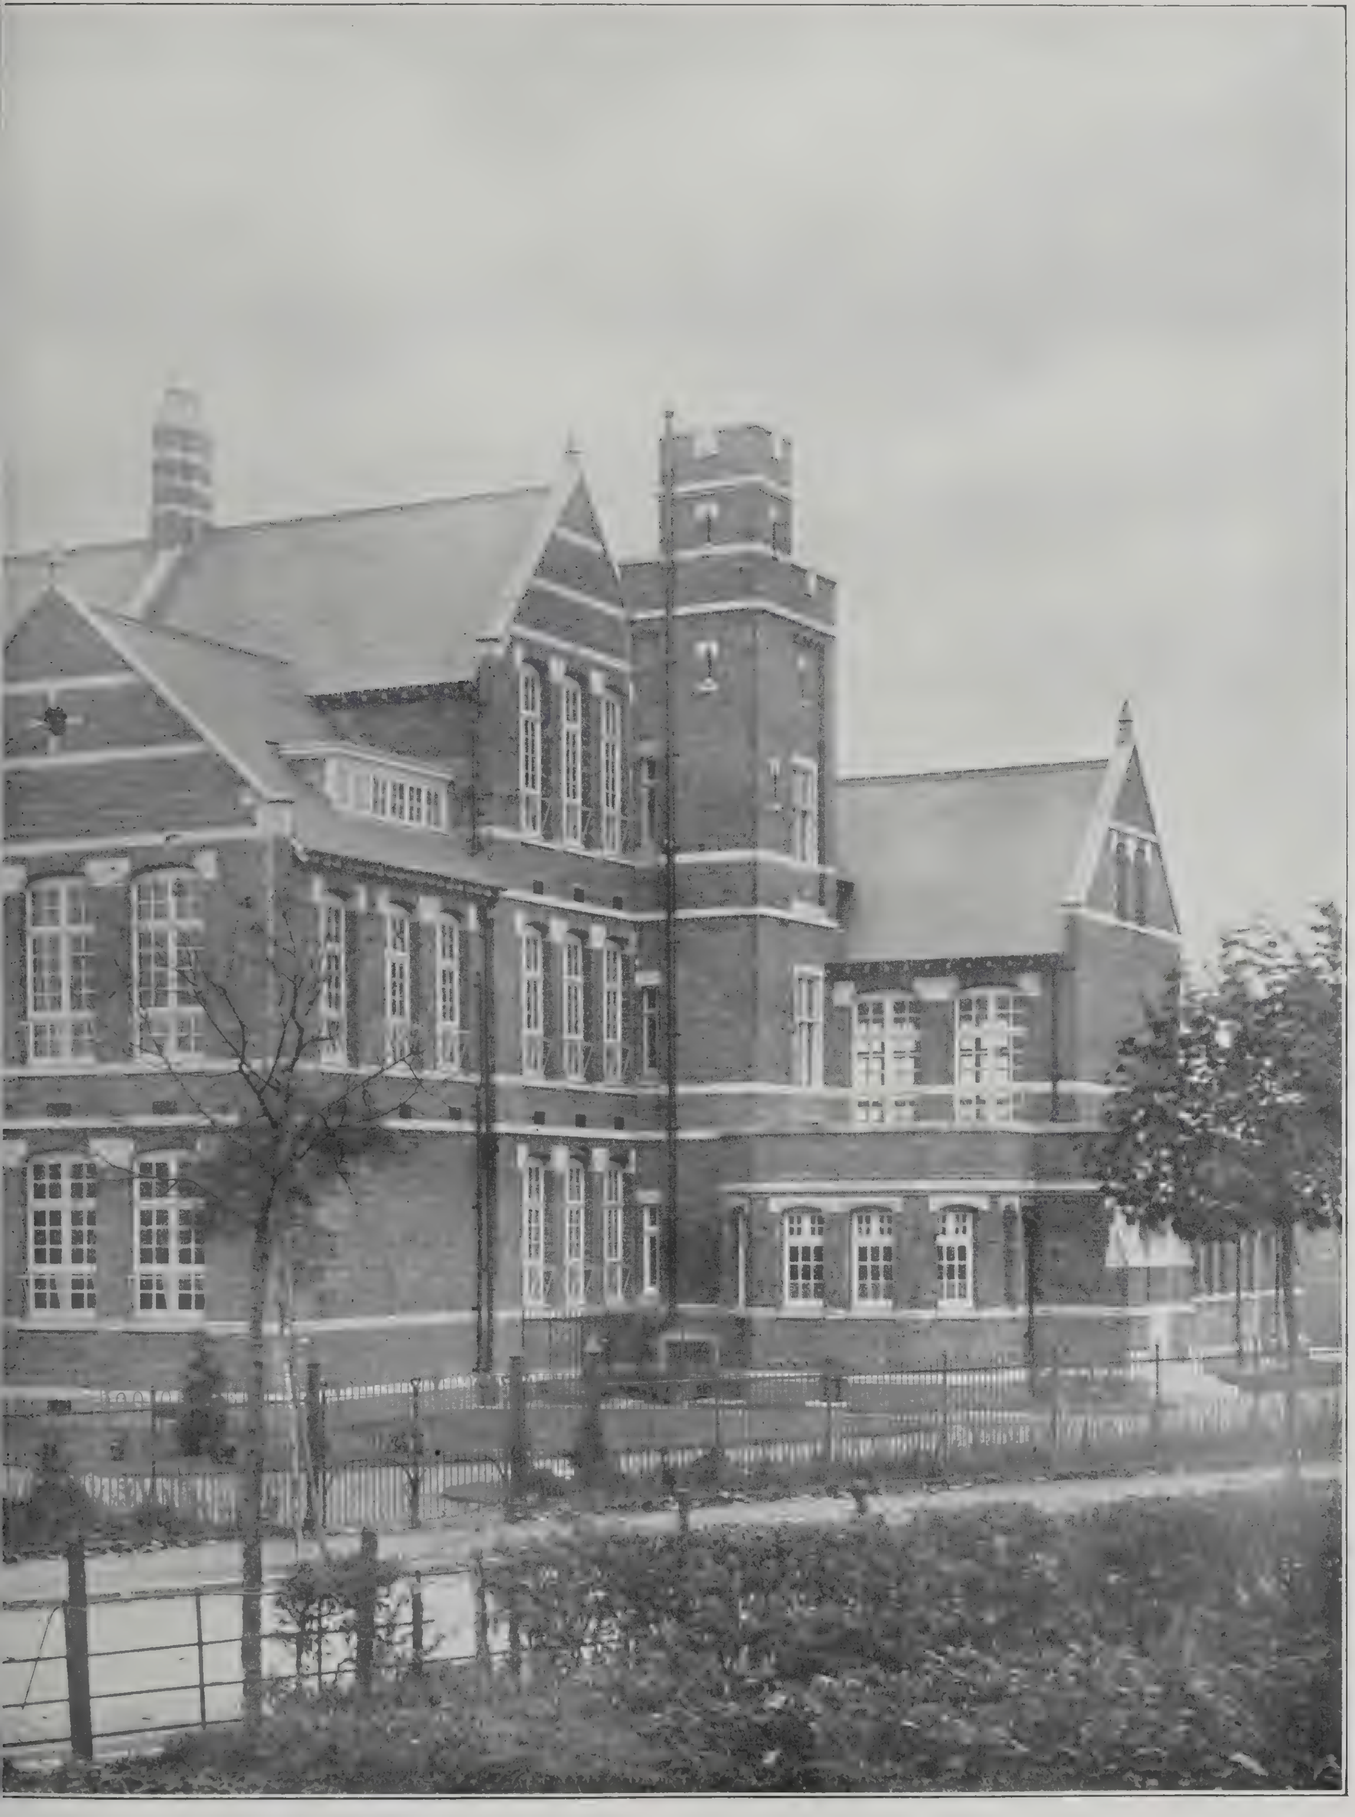
Girls' New High School, Gloucester.

The school of which the elevation is shown in our plate gives accommodation for 350 girls. The buildings are erected of local bricks, with Bath stone dressings, and the roofs are covered with Staffordshire tiles. The floors and staircases are of Hennebique reinforced concrete, executed by Messrs. Hobrough and Co., of Gloucester, and the floors are covered with maple-wood blocks. The main hall is 72ft. long by 34ft. wide and 27ft. high. The fifteen class-rooms are arranged to accommodate twenty-five desks each, but the rooms are made large enough to accommodate thirty desks without any increase of floor-space. The dining-room gives accommodation for 127 pupils. A roof terrace is provided over the second-floor corridor, and there are store-rooms in the roofs. The school is lighted throughout by electricity, and warmed with pipes and radiators on the low-pressure system. The builders' work has been carried out by Messrs. J. C. Wheeler and Sons, of Gloucester, from the designs and under the superintendence of Mr. Walter B. Wood, A.R.I.B.A., of Gloucester.

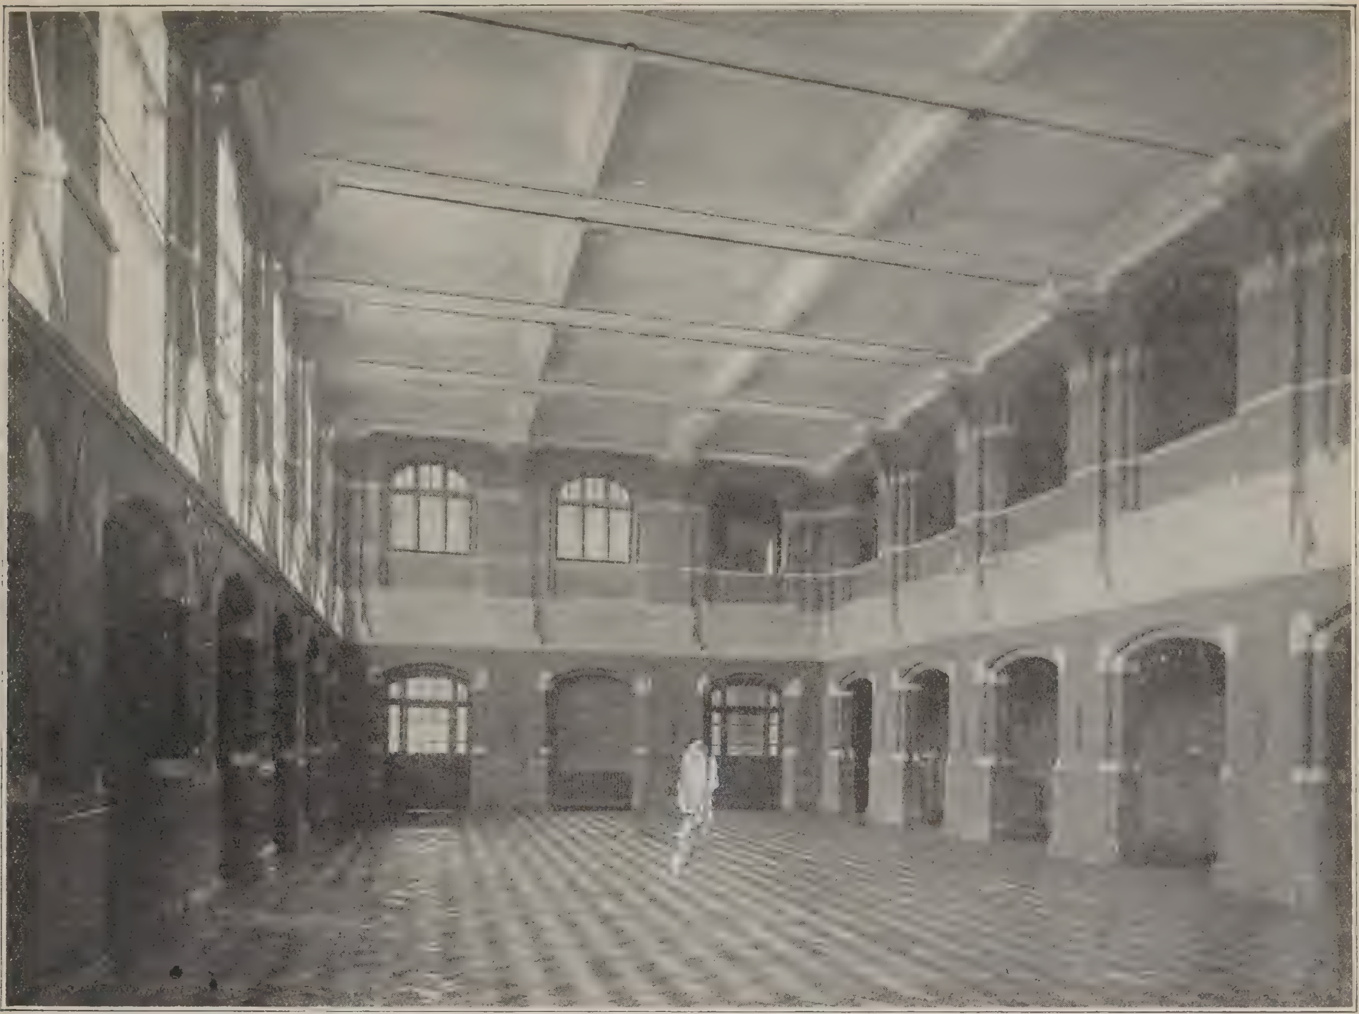
The reporter general of the Paris Municipal Budget, who already upon three occasions has endeavoured to enlist the interest of his colleagues in the Municipal Council in his plans for the improvement of the principal thoroughfares and public places of the city, has now drawn up a fourth scheme, which contemplates an expenditure of £16,000,000 for this purpose. Among the more important items which figure in the programme are votes for the completion of the Boulevard Haussmann at a cost of £2,000,000, and of the Central Markets, at a cost of £1,500,000. Votes on a similar scale are set down for the extension and widening of a number of other streets, and special attention is drawn to the fact that the scheme has been planned in such a way that all the principal wards of the metropolis would benefit uniformly by the proposed improvements. In addition, a sum of £4,600,000 is demanded for a reorganisation of the water supply, £3,680,000 for an education loan, and £1,450,000 to combat tuberculosis, etc.



GIRLS' NEW HIGH SCHOOL, GLOUCESTER. VIEW FROM



SOUTH-WEST. WALTER B. WOOD, A.R.I.B.A., ARCHITECT.



GIRLS' NEW HIGH SCHOOL, GLOUCESTER: THE ASSEMBLY HALL. WALTER B. WOOD, A.R.I.B.A., ARCHITECT.

Works in Progress and Completed.

ALTRINCHAM.—The District Council have accepted the tender of a local firm for the erection of a new hospital. Amount of tender, £8,700. The architect is Mr. William Owen, of Manchester.

ASHTON-UNDER-LYNE. — New textile offices for the South-East Lancashire Card and Blowing Room Association are to be erected. Mr. H. Lindley is the architect.

ANSDELL.—An Institute is in course of erection at a cost of £5,000, from plans by Mr. G. H. Willoughby, of Manchester.

BOTHWELL.—The Donald Institute is to be proceeded with. The architects are Messrs. Alexander Cullen, Lochhead and Brown, of Hamilton.

BRIDGE-OF-WEIR. — The foundation stone of St. Mary the Virgin Episcopal Church has been laid. The architects are Messrs. Dykes and Dale, and the contractor Mr. Jas. Keanie, of Johnstone.

COALVILLE.—A new secondary school is in course of erection by Messrs. W. Corah and Son, of Loughborough, at a cost of £7,250, the architects being Messrs. Barrowcliff and Alcock, of Loughborough.

FORMBY.—On January 12th, Holy Trinity Church New Parish Hall was opened. The building, which cost about £2,200, was designed by Messrs. Havelock-Sutton and Son, Liverpool. The contractors were Messrs. J. and G. Chappell, Walton, Liverpool.

HONG KONG, CHINA.—A stained glass window has recently been unveiled in the Cathedral here, by Sir F. D. Lugard, to the memory of Bishop Hoare, who lost his life in the typhoon of 1906. Appropriate subjects have been chosen as follows:—The Storm on the Lake; Christ walking on the waters; the calling of the Apostles by the Sea of Galilee; and the vision of St. John on the Isle of Patmos. The window, which has been much admired, was designed and executed by William Morris and Company (Ruskin House), Ltd., Westminster.

LEYTON, ESSEX.—The Parish Hall and Institute in connection with Christ Church, built at a cost of £1,835, has been opened.

LIVERPOOL.—The foundation stone of the new dental hospital has been laid. The building, together with its equipment, is to cost £10,000.

LIVERPOOL.—The Bank Telephone Exchange, South John Street, is now in course of erection from designs by Messrs. Bromley and Watkins, architects, Nottingham. The whole of the constructional steelwork and fire-resisting floors are being carried out by Messrs. Homan and Rodgers, Manchester.

LONDON: GOLDER'S GREEN.—The temporary church will be completed by June. Mr. Herbert Wills (Wills and Anderson) is the architect, and Messrs. F. and C. Foster, Norwood, are the contractors.

LONDON, W.C.—A cast of the Bacon statue, by Mr. F. W. Pomeroy, A.R.A., has been erected on a wooden pedestal in South Square, Grays Inn. The finished bronze will probably not be erected until 1910.

MANCHESTER.—The erection of the new Whitefield Wesleyan Church will be begun in March. The cost will be about £2,500. Mr. A. Brocklehurst, of Manchester, is the architect.

OLD COLWYN.—Plans for the proposed first portion of the new Wesleyan Methodist Church and Schools have been passed by the Trustees, and the tender of Mr. J. O. Davies, Colwyn Bay, has been accepted. The design shows a large school-church with two transepts and chancel, vestries, etc. Local stone will be used for the walls, which will be finished in roughly squared stones, the roof will be entirely open, with pitch-pine roof trusses, and green Welsh slates will be used for the roof covering. A quaint timber porch will be placed at the public entrance. This building will work out at an exceedingly low cost per sitting, and is the beginning of a much larger scheme, the designs for which have been sketched out, and which will comprise a large church of local stone, with bell-tower, etc. The architects are Messrs. J. M. Porter and Alcock, of Colywn Bay.

ROTHBURY.—The new Parish Hall has been completed and formally opened. Mr. C. S. Errington, A.R.I.B.A., of Newcastle, was the architect.

SHEFFIELD.—The new public baths being erected at Heeley, at a cost of £11,270, will be open to the public in May.

SOUTH MOLTON.—Additional school buildings are in course of erection at a cost of £2,000, including site.

TROON, SCOTLAND.—A new higher grade school was opened here on the 11th inst. Mr. James Miller, A.R.S.A., of Glasgow, was the architect.

TUNSTALL.—Messrs. Johnson Bros., earthenware manufacturers, of Tunstall and Hanley, whose Alexandra Pottery, Tunstall, was recently burnt out, are now having same rebuilt in a more thorough and up-to-date manner. They are also building a new flint mill here, their architects in both cases being Messrs. A. R. Wood and Son, of Tunstall and Burslem. The whole of the constructional steelwork, fire-resisting floors, and asphalte flats, to both jobs, are being carried out by Messrs. Homan and Rodgers, Manchester.

ARCHITECTURAL TREATMENT OF REINFORCED CONCRETE.*

By John H. Markham, A.R.I.B.A.

When I was first asked to read a paper on Reinforced Concrete, it was to have been more especially with reference to Design—that is, I presume, the character of artistic expression suited to this method of construction. I rashly undertook to do this; but in attempting to get together matter for illustration and example, I found the question of the proper artistic treatment had very seldom been fairly tackled in building work of a kind usually within an architect's practice. A good deal of simple straightforward engineering work has been done which, I think, is often of pleasing appearance when not spoilt by any pretence to be other than it is. But when buildings, such as an architect is accustomed to deal with, have been undertaken in this method of construction, the front has generally been built of brick or stone, and the reinforced concrete part all been hidden, as would have been the case with a steel frame. This has compelled me to take up the chief features and principles of this method of construction, and try to deduce therefrom some ideas for the right treatment of it.

Having briefly described the materials employed, the lecturer proceeded: I will now come more particularly to my professed subject, namely, design. And in dealing with design, I shall divide my remarks into three main heads:—I. What I shall call "internal" design. II. Main structural lines and forms. III. Decorative design and finish.

A Peculiarity.

A great peculiarity of reinforced concrete is that, not only, as with other better-known materials, is it necessary to decide on the size a member must be, but it is also necessary to design the internal structure of the member itself. In fact, it is necessary to design the material as well as the building.

In using steel or wood, a member of certain size and section is found necessary, and it consists throughout of the same steel or wood of known, and practically uniform, strength; and all members of the same size and section will be approximately of the same strength. However, the strength of reinforced concrete members of any given size and section may vary within very wide limits, according to the percentage and disposition of the metal, even where the strength of the concrete and steel may be constant. It would be possible to introduce, say, 1 per cent. of metal into a concrete beam without in any way strengthening it; and it would also be possible to introduce 1 per cent. of metal in such a way as to very materially raise the moment of resistance the beam could offer. It is not quite my province to-night to deal with this question of internal design, which is a very large subject, as there are many systems, some of them covered by patents, which make it somewhat awkward for a designer to make use of the method of reinforcement he may consider most suited in each particular kind of member. After briefly detailing the principles of reinforced concrete construction, the lecturer came to the consideration of the general structural lines of erections in these materials.

Lack of Precedent.

In beginning a design for a reinforced concrete structure, the first thing the designer feels is the absolute lack of precedent. In dealing with structures of brick and stone, or even steel, there are by this time more or less recognised ways of solving every ordinary problem of design. If the designer be possessed of great originality, and can deviate from the hackneyed methods in a direction which others feel to be an improvement, then he has not only produced that which is interesting and pleasing, but he has advanced the art of design. But if he find himself unable to improve on the usual solution of the problem, then he is not blamed for adopting it; but he has failed to produce anything possessing special interest.

In designing reinforced concrete, however, no tradition or precedent exists; and if the designer should be unable to evolve from his own brain a form of structure which shall be at once sound as to constructive principles, suitable to the material, beautiful as to form and appearance, and withal practicable from a commercial point of view, then he fails to produce a satisfactory reinforced concrete building. This lack of precedent becomes a very real difficulty in a structure in which the utilitarian requirements give considerable latitude for the possible variations of form. One asks oneself: "How shall I begin? How is a thing of this sort usually done?" Then, to save oneself trouble, one is apt to fall into one of two errors, or possibly both, and to treat the structure as a steel structure would be treated, or else as a stone building.

Ancient Use of Concrete.

Here I would just refer to the use of concrete as a structural material in ancient times. You will all remember the Roman use of concrete in large masses, though with a kind of reinforcement in the form of brick arches and lacing courses. Their concrete owed much of its strength and durability to the employment of a light volcanic earth, known as pozzolana, which formed with the lime a very strong hydraulic mortar. The chief uses to which concrete was then put were—to form floors, or to form large vaults and domes with brick arched ribs and brick lacing courses, or to form walls with, generally, a facing of brick or stone. Since Roman times builders have not had the advantage of such an excellent material as pozzolana, and concrete almost dropped into disuse. Something similar was probably used for foundations in the form of very coarse and random rubble work, and as a covering to vaults in the mediæval buildings, but it is not anywhere evident as a part of the designed structure.

Roman Practice No Precedent.

As to structural lines, the Roman use of concrete affords us no precedent for designing in reinforcement concrete, because their use of the material was in enormous masses, and could only be where the principal stresses were compressive. Their concrete domes are said to have had no thrust, but act merely as inverted saucers. Where they supported nothing but their own weight, the thrust might have been negligible; but it seems to me that there must have been a sort of internal arch action amongst the particles of the mass, and the thrust so produced, if not transmitted to the walls, must have been counteracted by the tensile strength of the concrete. If a superimposed load were placed on the dome, I think this thrust would surely have become more than the tensile resistance of the concrete could withstand, and unless some outside aid were forthcoming, the whole would collapse. However, as I have already stated, we do not rely on the tensile resistance of concrete in any way. Wherever tensile stress exists, steel must be introduced. Moreover, another essential difference is that, whereas a Roman concrete wall was of very considerable, and practically uniform, thickness, taking stresses all along, in reinforced concrete no such arrangement is permissible. A wall consists of a framework of stanchions and beams, which take all the stresses, and the remainder of the wall is formed of mere screen panels of very little thickness. This is true of steel-frame buildings also; and it is this principle which is the only one that will affect the structural lines of architectural buildings. By architectural buildings, I mean those forms of structures usually designed by architects as distinct from engineering structures, such as bridges, large roofs, water towers, etc. I think this framework and panel treatment should make itself very evident; and it would seem quite suitable to build the panels afterwards in some other material, as brick, stone, block concrete, or

---

terra cotta, each panel being carried by the beam below it. The vertical members will, as a rule, be emphasised as they are more important, becoming larger and stronger towards the bottom, because there they carry the whole load of the wall, and their proportion of the floor loads, whereas the beams all do practically the same amount of work—i.e, carry the panel over, and a proportion of the floor—and are, therefore, of the same size. However, in some cases the horizontal members are emphasised, and the vertical members kept subservient. In buildings of the warehouse and factory class, the windows are often made to take up the whole of the panel space.

Reinforced Concrete and Steel Construction.

I have alluded to the tendency to treat a reinforced concrete building in the same way as a steel structure as an error. I admit a certain reasonableness in such a course, on account of the fact that both methods of construction are subjected to exactly the same dynamic laws. We have already classed them together as being identical in their effect on the lines of architectural structures; but in engineering works, so-called, they will be somewhat different in their characteristic forms. Perhaps it may be thought somewhat out of place for me to address you on the subject of engineering; but I see no sufficient reason for the distinction between engineering and architecture. In old times, bridges, towers, viaducts, and such like erections, were designed and carried out by the same men who designed public buildings, and probably private houses as well; so that I shall presume we still maintain some sort of intelligent interest in such work, though we may never be called upon to undertake it.

Scope of Reinforced Concrete.

There will, I think, be much more scope for the use of reinforced concrete, and opportunity to evolve a suitable style of design in such buildings as: bridges, large roofs, as over swimming baths, etc., towers for various purposes, lighthouses, tanks and reservoirs, to say nothing of all kinds of foundation work, than there will be in architectural buildings; and it is such I shall have in mind in speaking of the difference between steel and reinforced concrete.

In these structures, reinforced concrete is likely to find favour, because it does not need the periodic painting necessary to preserve a steel structure from corrosion. In most, if not all, works of this kind, economy of cost is an important consideration; and in steelwork the cost varies approximately as the amount of material employed. Not so with reinforced concrete. In a plain and simple building of reinforced concrete, about 30 per cent. of the total cost is expended on centreing and falsework alone, which all disappears when the structure is complete. Again, the metal costs a great deal more than the concrete, bulk for bulk, so that it may quite well happen that a design, which uses a considerably larger quantity of material than the minimum possible, may be of much less expense in execution, because it is of such a simple character, that a great saving of falsework is effected, or members are so skilfully arranged, both as to position and their internal composition, that the concrete is made to do as much work as possible, and the minimum quantity of metal is used. Therefore, I should say, first and foremost, let parts be simple and large, rather than intricate and small.

"A Certain All-overishness."

In steel structures a certain all-overishness is often noticeable, arising from the use of small members in a sort of truss form of spider's web appearance; but in reinforced concrete it is better, if possible, to use larger main members and confine the connecting trusswork to certain parts. This gives a pleasing appearance from the fact that the more intricate parts are concentrated, and the main members emphasised. This is, of course, not always possible, but can sometimes be contrived with a little thought. The volume of material is increased, but a saving may be effected on the falsework. (The ethics of imitating stone work I speak of under my third heading.) Moreover, a great saving is effected if parts are repeated so that the same falsework may be used more than once; only it is not much good repeating any particular form of feature in another part of the structure much on the same level, because the falsework will be wanted in both places at the same time. Where repetition occurs, it should, if possible, be arranged so that the falsework will be finished with in one place before it is wanted at another. I am not advocating the repetition of parts *ad nauseam* by any means, but it is quite possible often for the same form to be repeated two or three times with very slight variation, not necessitating much adjustment of the falsework. In this connection I would mention that I have been told that it is not found economical to use the same wooden centreing more than three or four times. After that it becomes warped and surface hardened, and the expense of correcting the defects is as great as forming new.

I need scarcely speak of the advisability of concentrating ornament, and using it on the parts which have no great structural function to perform, so as to leave the main structural members simple and apparent as to their importance. At any rate, ornament, if applied to structural members, should be such as will not in any wise render the member apparently less fit to perform its function.

Decorative Design and Surface Finish.

This brings me to my third and last division: Decorative design and surface finish. In this part of our subject, we may learn a lesson from the Roman builders, in that the surface treatment of concrete may be the same, whether it be used as mass concrete or reinforced. Roman concrete walls were finished in three different ways.

I. *Opus incertum*, where the wall is faced with irregular pointed pieces of stone, placed with the point inwards. II. *Opus reticulatum*, which consists of similar pieces of stone to those of the *opus incertum*, only the faces were square and regular, and the surface presented a sort of network appearance. III. The walls were faced with thin triangular bricks, laid breaking joint. Yet another method was to apply marble slabs, fixed to the wall by metal cramps. This method was also applied to brick and stone walls. Vaults and domes often had coffers cut into their surface, and the whole covered with a fine *cœmentum marmoreum*. All these methods are, of course, still possible, and to them may be added, mosaic, and tiling.

As to modern methods. A very favourite way is to render the surface to resemble stone construction, and in some cases V-shaped strips are nailed to the falsework to form depressions in the finished concrete, similar to V sunk-jointed masonry, and the surface picked over to leave the flat surfaces rough. The attempt to imitate stonework so frequently adopted in buildings of reinforced concrete can scarcely be described as "building in truth," and, therefore, I must condemn it.

Reinforced Concrete Monolithic.

A certain similarity of appearance there will be of necessity between buildings of reinforced concrete and those of stone. I am not urging that this similarity, where it is natural, should be concealed, but I am deprecating any attempt at making the two alike. Two essential differences which I think should certainly have their effect on the types of design suited to each material are:—First, that, whereas stone walls are more or less of even thickness, supporting weight all along, walls of reinforced concrete are composed of stanchions and beams with screens, as before explained. Secondly, many features in stonework design are the outcome of the necessity for using this material in separate blocks. Reinforced concrete is a monolithic material. There are no joints; and I think all that which in stone design is the outcome of the necessity for separate blocks with joints should be eliminated. For instance: a stone column has base, shaft, and capital; and the capital, especially, is distinctly a different piece of stone from that forming the shaft or architrave, and is treated as such. If a reinforced concrete support receives an enriched treatment at its upper end, I think the ornament should run on to the beam above, and possibly connect up with the base of the stanchion over. A reinforced concrete support in the form of a Corinthian column would be most inappropriate, though I would not object to a reinforced concrete beam being moulded as a classic architrave. I think my meaning will be clear.

Screen Fronts.

Another method, which is rather cutting the Gordian knot than untying it, is to do all the structural and internal work in reinforced concrete, and to form the front facing screen in stone on brick, built up independently of the rest of the structure, and attached to it at the floor levels by allowing some of the floor reinforcements to project and be built into the masonry screen. This method is being employed at the road frontage to the New Post Office building. When this is done, care must be taken that the slight settlement of the reinforced concrete structural part, which is bound to take place when loading has been applied, does not throw a certain amount of stress on to the masonry screen, and so cause it to bulge.

It seldom happens that the concrete can be left without further treatment after the removal of the centreing or falsework in cases where the appearance has to be considered at all. Sometimes moulds are lined with zinc, sheet iron, or plaster of Paris, and oiled to prevent adhesion, and a coat of mortar, to give a smooth surface, is applied to the inside of the mould first; and then the concrete and reinforcement put in afterwards, but not forced so as to press through the mortar and appear on the surface when the falsework is removed.

In some large office buildings, erected by the Turner Construction Company of New York, the only treatment applied after the removal of the wood falsework was to put on a coat of cement and white sand with a brush. Another method they have tried is to apply a coat of oil paint, mixed with sand. In cases where very little work is done after the removal of the falsework, some special precautions have to be taken to remove the unsightly variation in texture which is visible wherever a break in the laying occurred.

Coloured Concrete.

A certain percentage of colouring matter may be added to the cement if desired; the amount, say Messrs. Marsh and Dunn in their admirable book on Reinforced Concrete, should not exceed 10 per cent. per volume, and should be less if possible. Of course, care must be taken to ensure that no colouring is used which will have a chemical action on any of the materials used, or be easily affected by the acids and other substances in the atmosphere.

It would seem that in treating the surface of reinforced concrete buildings, all decoration should be comparatively flat, and if any ornamental features are added of considerable projection, they must be reinforced and form part of the structure. The surface coating should be as thin as possible.

Sgraffito Treatment.

I would suggest that a suitable form of decoration would be a kind of sgraffito work done in this manner. The mould to be formed of plaster of Paris, or other smooth surface coated with shellac to prevent adhesion, and having pieces of the form of the sunk ornament about ½in. thick applied thereto in the proper positions. Then render over the inside of the mould with a coloured mortar flush with these applied forms. This coloured mortar will form the main surface of the member when finished; then float over the whole inside of the mould with another coloured mortar, which will form the sunk surface of the ornament; and then put in the concrete and reinforcement, taking care not to push any stones through to disturb the surface. If more adhesion were required between the layers of mortar and the concrete, wire or nails could be stuck into the mortar at intervals from the back as the concrete was being put in.

Plain Surface.

In cases where only a plain surface is required, it may be formed as soon as possible after the removal of the falsework by the application of a rendering with a float, or by splashing it on from a brush to give a roughened surface; or a mortar may be used with fairly large and coarse sand grains which would leave a rough surface. Mortar applied as rendering should be of much the same richness as the concrete, otherwise the expansion and contraction will be different with the risk of the surface becoming detached.

Facing with Faience.

Another method which it seems to me would be quite a satisfactory one for buildings, especially in towns, would be to have the surface formed of faience blocks shaped at the back to connect more rigidly to the concrete. These would be placed in the falsework with small pieces of card or felt in the joints, and the reinforcement and concrete filled in behind in the usual way. This method would have this advantage, that the timber falsework would not need to be quite so carefully and expensively formed, as it has only to hold the faience blocks, it does not come in contact with the concrete; it could, moreover, be soon struck. My idea in suggesting pieces of card, or felt, in the joints was to keep the joints between the faience blocks open, so that, even if a slight settlement of the structure occurred, no weight would be thrown on the faience. Of course, these strips would afterwards be removed, and the joints pointed up in cement. This is only a variation of the Roman methods already described.

Brickwork Wall Screens.

Another treatment which has been adopted is to form the necessary beam and stanchion treatment in reinforced concrete, and to build the wall screens in the panels in brickwork or other suitable material. With that, I think, my suggestions come to an end.

I can only hope by these few suggestions to have somewhat stimulated your interest in a very large subject. Little has, as yet, been done to demonstrate the æsthetic possibilities of reinforced concrete; but I hope when you have the opportunity of erecting buildings in this manner of construction, that you will do all you can to invent a suitable artistic treatment, and that it will not be allowed, either by architects or engineers, to be merely, a cheap and always ugly or else hidden, method of construction.

Discussion.

Mr. MATT. GARBUTT said he had great pleasure in proposing a hearty vote of thanks to Mr. Markham. The subject was a big one, and the paper was, he thought, a good attempt to solve the problem of treating reinforced concrete in an architectural manner. From the examples of buildings he had seen constructed in this material, he realised, as Mr. Markham had pointed out, the difficulties confronting the architect—as, for instance, the design of columns and members of that sort. The Corinthian column had been cited in the paper as an example, and certainly the elaborate capital of this column did not lend itself to the use of the necessary steel reinforcement. He had further noticed that ornament had the appearance of being stuck on, and of not forming an essential part of the design.

Mr. EDWIN O. SACHS expressed much pleasure in seconding the vote of thanks, and observed that he had come to learn, and had learnt. The point he would like to emphasise was that the time had arrived when it was really necessary for a society like the Architectural Association to include in its curriculum lectures upon reinforced concrete. He noticed a great tendency to the enumeration of various systems, and this he regretted. Could not the architect take up the design of buildings in reinforced concrete, without adopting any particular system? He was glad to hear that three of our chief railway companies were taking up reinforced concrete, but adhering to no specific system.

Mr. Statham, Mr. J. E. Franck, and Mr. Munby also joined in the discussion.

THE COMMONSENSE USE OF MATERIALS.

The first of a series of three lectures, arranged by the Worshipful Company of Carpenters, was delivered at the Carpenters' Hall, London Wall, on Wednesday, January 13th, by Mr. R. Weir Schultz. The subject was "Reason in Building, or the Common Sense Use of Materials." Mr. Schultz commenced his lecture by congratulating the master and court of the company on their enterprise in endeavouring to counteract the decadence of apprenticeship in the crafts. He remarked that it was very gratifying to note that the Worshipful Company of Carpenters, together with other City companies, had in the past, and still continued, to interest themselves in this matter, for the real solution of the problem must eventually come either through the crafts themselves or some organisation connected with them. Many of the City Guilds still took an interest in their own particular crafts, but, on the other hand. many have completely lost touch with the crafts to which they owe their origin; consequently other organisations have risen to take their places, namely, the trade unions. It is probable that in time to come these unions will make it a condition that before a man is admitted to full membership, he must show them that he has a complete knowledge of his craft, and then they will naturally wish to take a part in their training. The general opinion seems to be that apprenticeship is doomed, and the only substitute we have for this system is the technical schools. These schools have failings. They tend to make things too easy for the beginner, and so he grows up lacking initiative. Also the teachers at these schools, although originally craftsmen, are now frequently school-trained men with very little experience of trade conditions.

The lecturer proceeded to enumerate the best ways of gaining practical experience, namely, (1) studying the works and methods of old builders; (2) by learning from the old craftsmen, whenever possible; (3) by keeping one's eyes open and profiting by the experience of oneself and others.

The old craftsmen from most ancient times were trained under a system of apprenticeship, and this system is not yet entirely dead. He instanced country places where the craftsman still chooses his own materials and fashions them on the spot, but in very few cases do the younger generation follow the old tradition. The lecturer dealt briefly with the effect which machinery has had on the crafts, and looked forward to the time when by means of electric power, large factories would give place to small workshops, where work would be caried on under better conditions.

Touching on the study of the old builders, Mr. Schultz advised students to go to work in an intelligent manner, and to look below the surface for the reasons for doing things. Let them also bear in mind that this is of more importance than pretty sketches and even measured drawings.

Dealing with materials, the lecturer pointed out that in the past, owing to the difficulty of transit, the materials on the spot were invariably used, except in the case of large mansions, churches, etc. So in Somersetshire, and the Cotswolds, we find stone buildings with stone slated roofs. In the home counties, such as Kent, Surrey, and Hants, where bricks and timber abound, we find timber-framed and brick buildings with tiled roofs, while, again, in Herefordshire and Cheshire we find timber frames filled in with wattle and daub.

He contrasted these conditions with those existing at the present time, when, owing to the increased cheapness and facility of transit, it is often more economical to build in materials brought from a distance, than to use those in the neighbourhood. However, there is always a way out of a difficulty, and as far as possible, materials should be used that will harmonise with the buildings around. In districts where timber was plentiful, it was invariably used for the framing, the filling in varying with the locality, being in some cases brickwork, in others clay, etc.

Dealing with roof coverings, he remarked that thatch was general where grain was grown, or reeds or heather available. It had many advantages, and some obvious disadvantages, and its use nowadays is almost entirely prohibitive, owing to by-laws and insurance companies' regulations; consequently the art had practically died out.

The lecture was illustrated by a series of lantern slides showing various types of buildings constructed in local materials, and also a hall at Cardiff, built at a minimum cost by Mr. Schultz, with an open timber roof built up of timbers of the usual stock scantlings, obtained from a yard close by, and which demonstrated in a very decisive manner a commonsense form of construction, together with the use of the cheapest materials at hand.

Mr. R. Weir Schultz, F.R.I.B.A., at the commencement of the second lecture of his series, delivered at Carpenters' Hall, E.C., on Friday last, stated that he proposed to deal with the principal crafts connected with building, and to endeavour to explain how it is possible to use the materials connected with these crafts in an honest, simple, and straightforward manner. Nowadays, he regretted to say, materials were often used in a manner detrimental to the building, both as a work of art and as a good piece of construction. There is, he said, in the work of the day, a general note of self-conscious inefficiency. However, he added, much good work is still being done, but it is more or less exotic, and not truly representative. He was sorry to say that a great deal of this was due to the false position occupied by architects at the present day.

How can we expect satisfactory results, when young architects are trained in front of drawing-boards, in stuffy offices, out of all touch with practical work, except an occasional visit to a job? He noticed that some of the best architects in recent years had gone through the workshop, notably Mr. Bentley, the architect of the Roman Catholic Cathedral at Westminster. His work, he said, contained qualities, lacking in the work of those who had not the same knowledge of materials and construction. Take, for example, the young architect of the present day. He is taken straight from college or school, and put in the office of an architect in practice. Occasionall, he is taken or goes on to, a job, but he is seldom allowed to stay and see for himself how materials are used, and still less often does he take off his coat, and try to do something himself, if only to find out how difficult it is. Then, at the end of three or four years, he settles down to design buildings himself, and teach practical men how to do their work, for, after all, isn't the architect the boss?

Mr. Schultz recommended all who were interested in the way famous buildings were erected in the past, to read Professor Lethaby's delightful book, "Westminster Abbey and the King's Craftsmen: A Study of Mediæval Building."

Returning to the subject of architectural training, the lecturer remarked that he did not wish to imply that an architect should have no theoretical training. We are often told that he need only have a rudimentary knowledge of science; but, he said, the architect of the future will have to be, to a large extent, an engineer.

If a living type of architecture is to arise again, it must come from a reasonable and sound use of materials, the artistic part will take care of itself. A man, he said, need not be an artist to erect a beautiful building. If the construction is right, the art will come.

Mr. Schultz then briefly considered the various works which go to make up a satisfactory building. As to foundations, he said, many points called for consideration, of which the nature of the subsoil is the most important. A good gravel bottom, firm sand, or even hard earth present no very great difficulties, but rock means extra expense. He recommended, in the latter case, taking out the earth, should the rock be close to the surface, and levelling up with concrete, rather than cutting away the rock. Then by-laws must be considered. He instanced a case where an architect was building direct on rock, when the surveyor came round, with the result that the rock had to be cut away and a foot of concrete put in.

He next referred to the craft of the scaffolder. In the old days, this was a fine craft, and a building covered with good scaffolding was a fine sight, but nowadays, it is being supplanted by "Scotsmen," and we also get high art scaffolds, painted and decorated. In fact, he said, scaffolding is now very often designed by an engineer, and passed by a county council, naturally an expensive matter. The stadium, at the Franco-British Exhibition, Mr. Schultz referred to as a fine piece of straightforward construction, with no waste of materials.

Dealing with stone as a material, he advised first of all a visit to the quarry to see in what sizes it is got out, etc. Then, if it has been in use for some time, an inspection of buildings constructed with it, in order to note its weathering properties, etc. Great care must be taken to place the stone on its natural bed, otherwise it will flake off, and also allowance must be made for getting the water off cornices and mouldings by throating. The effect of weathering on the stone should be carefully noted. For example, take Portland stone. Where it is exposed to the weather, it goes a beautiful mellow white colour, as may be seen in the case of the towers of the city churches, and the upper part of St. Paul's Cathedral. Having dealt with the various ways of bedding stone in mortar, he warned his hearers against directly copying old buildings and the works of the old builders, which he described as "unintelligent archæology," but rather to look below the surface for their reasons for doing things. As to granite, it should be used in a simple straightforward way, and should not be cut too small, as it is naturally quarried in large blocks.

Marble, he said, was used by the Greeks as a constructive material, but by the Romans chiefly as applied decoration. They cut the marble into thin slabs, the ends at the corners always showing the thickness of the slabs, not, as is done to-day, mitred off. When using marble, he recommended a very careful selection, as marbles are often placed together which do not blend, and are not in sympathy with one another.

A large number of lantern slides were shown, accompanying the lecture, and illustrating the different kinds of construction, and also the excellent results which could be obtained by a judicious use of the materials of the localities in which the various buildings were situated.

"La Petite Bagneuse," by Rodin, is the title of a new marble that has been added to the already interesting group of sculpture at the International Exhibition in the New Gallery.

* * *

Books giving designs for monograms have hitherto been few and expensive. Some few years ago, Messrs. Jack issed a large collection designed by Mr. A. A. Turbayne, and a new edition of this work is now announced, at about an eighth of the original price. This will place a collection of the latest designs within the reach of the most modest purse, and should ensure a large sale amongst artists, designers, and draughtsmen of all kinds. The book, as regards contents, will be exactly as originally published.

* * *

Mr. Geo. Thompson informs us that he has been appointed Principal of the Toxteth Technical Institute, Liverpool, and that any letters or other correspondence should be sent either to that institution or to his private address, which will be 14, Ampthill Road, Liverpool.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Jan. 31	*SOUTH BANK - IN - NORMANBY. Town Hall, Council Offices, etc., for the Urban District Council. Particulars of the Clerk, Town Hall South Bank, S.O., Yorks.
Mar. 17	NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3,500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council, Stanley S,O., Co. Durham.
Mar. 31	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days.
No date.	PONTARDAWE (WALES). Offices for the Guardians, in Holly Street. Premium £10 10s. The premium is offered by the Guardians "for plans with abridged specification, *which in their judgment* are best suited." Particulars and conditions from C B. Jenkins, Clerk, Herbert Chambers, Pontardawe, S.O., Glamorganshire.
No date.	BLACKBURN. The Blackburn Small Holdings and Allotments Committee have decided to invite architects and surveyors in the Borough to submit competitive plans for the laying-out of the estate at Oswaldtwistle, recently purchased for small holdings. Premiums of £25, £10, and £5 are offered.

**The R.I.B.A. Council has requested Members to refrain from competing.*

Carnegie Library, New Mills.

A decision has been arrived at by the New Mills District Council and the Free Library Committee as to the adoption of plans and the award of premiums for designs of the new free library which it is proposed to erect with Mr. Carnegie's gift of £2,000. Premiums had been offered for the first three designs, namely, £15, £10, and £5 respectively, and after much consideration the awards were made as follows:—1, Mr. R. B. Preston, Disley and Manchester; 2, Messrs. Butterworth and Duncan, Rochdale; 3, Messrs. Potts, Sons, and Hennings, Manchester. The designs of Mr. Preston were adopted.

Tynemouth Palace Competition.

The Tynemouth Aquarium and Winter Gardens, erected some years ago at a cost of £80,000, have again changed hands, and the new owners recently invited plans for the improvement of the building. The result has just been made known, the successful competitors being Messrs. Marshall and Tweedy, 17, Eldon Square, Newcastle and North Shields. Their scheme includes the erection of a large theatre and concert hall for 3,000 persons; a skating rink 70 yards long, and other items. Fibrous plaster ceilings and proscenium will take the place of the present glass roof and temporary stage curtain. The contracts for the work will shortly be placed, and, if possible, the opening will take place at Easter.

Concerning Competitions.

We have received the following letter anent our leader in the issue of January 13th:—There are one or two points in your leader on the above subject which are open to criticism. You admit that we cannot rely on an assessor to discriminate between the good and bad schemes submitted for his consideration and award. Surely merit alone should be the criterion, whether the work be that of the young and ambitious, or of men of known skill and experience. You suggest "limited competitions." These would result in still greater disaster to our English architecture for various reasons.

(1) You do not recognise the fact that all the men now in the front rank of the competition world were once tyros, unknown and inexperienced. They have profited by failure, and have learnt architecture in the hardest school of all—the competition field.

(2) If you limit competitions, how will the ranks be filled when the present well-known men retire? Will it be by examinations, or by private influence? The men whom you seek to shut out, the assistants and students of to-day, are the architects of the future. If you deprive them of the experience to be gained in competitions, twenty years hence there will be a greater dearth of good Architecture than there is at present.

(3) Much of the work done by young architects shows both skill and a thorough grasp of the subject, and compares favourably with that of the more experienced, but less scholarly practitioners. If experience must be added to scholarship, it can only be done by granting facilities which open competition afford. This fact is apparent in any show of competition drawings. You find a really good elevation thrown away on a half-worked-out plan. Of course, the scheme is useless, as the plan, though correct architecturally, does not comply with certain necessary conditions. These defects in planning can only be realised and remedied after many unsuccessful efforts by the author, whose mind becomes more technical, and his brain more facile, at planning under stated conditions, in a more masterly, architectural manner at every subsequent attempt.

(4) In a competition of any importance, only about 15 per cent. or 20 per cent. are in the running, and the assessor should have little difficulty in choosing these, if he is a man well versed in the principles which govern good planning and scholarly design, coupled with a complete knowledge of the requirements of the building, for which the competition was originated.

ICTINUS AND MNESICLES.

Berkshire County Council Offices, Reading.

A competition is to be instituted, limited to the architects in Berkshire, for new Council Offices, to be erected on the sites of Nos. 26, 28, and 30, the Forbury, Reading. The decision to proceed with the scheme was reached by the Council at their meeting on the 9th inst.

New Schools, Ilkeston.

Mr. Widdows, of Derby, the assessor in the competition for the proposed Hallcroft Schools, has selected the design submitted by Mr. H. Tatham Sudbury, of Ilkeston.

Whittingham Asylum, Preston.

The result of this competition reached us as we went to press:—

First: Messrs. Sykes and Evans, Manchester.

Second: Mr. Lodge.

Third: Messrs. Appleyard and Quiggin, Liverpool.

In the Tribunal of Appeal under the London Building Act, the vacancy caused by the death of Mr. E. A. Gruning has been filled by the appointment of Mr. John Slater, F.R.I.B.A.

* * *

Mr. W. S. Frith, sculptor, and Mr. F. Pearson, architect, have been commissioned to execute a memorial to be erected in Truro Cathedral in commemoration of three distinguished Cornishmen—Lord Godolphin, who was Lord High Treasurer under Queen Anne; Sir John Elliot, a notable Parliamentary leader in the time of Charles I.; and Sir William Molesworth, who was the first statesman to hold the office of Secretary of State for the Colonies. The memorial has been provided by public subscription.

THE FUNCTION OF COLOUR IN STREET ARCHITECTURE.

II.

By P. M. Stratton, A.R.I.B.A.

(Concluded fom page 6, No. 725.)

Most modern cities are entirely of mushroom growth, though sometimes sprung from the germ of an ancient foundation, whose building traditions they have cast aside; whilst in the seaports there is a strong cosmopolitan element. All resemble one another in being so vast in extent that the surrounding scenery is shut out. No background of wooded hills, barren mountains, or open downs can be seen from their streets; the only bit of nature that is visible is the streak of sky above. In such circumstances architecture need not be so restricted to the use of local material, as in the country towns and villages.

On the other hand, it is in cities that the architect meets with one of the greatest difficulties in the display of choice materials. I refer to the fog, soot, mist and smoke that at one moment entrance the artist and the next make him despair. Yet were London the most beautiful city ever built, no one would wish to dissipate utterly that atmosphere, which at present constitutes its charm. See it when the wind drops and the mist begins to gather round the buildings. The smoke drifts down into the street and lessens the sun's glare. Harsh outlines are softened, angles seem gently rounded off, crude contrasts of colour are blurred and reconciled, as it were by a wash of purple grey, over everything. But the air grows hourly thicker with fog and smuts, until all suggestion of the surroundings is blotted out. At last the rain clears the atmosphere. The sun comes out whilst the walls and roof are still dripping. Every building is seen through the iridescent hues of moisture held in the air, and the sun turns to crystal each drop of water hanging to cornice and sill. Down in the wet pavement are reflected the hues from buildings on its edge, the roadway borrows blue from the sky. They endure only for a quarter of an hour, these fairy colours, but long enough to bear inspiration for the architect to create others that will not fade so soon. Unhappily the surface of marble, the most precious of our materials, is soon destroyed by the acids of this same poetic city atmosphere. So in most of our streets it is useless to display such stone as that of Le Perucq of Jersey; green-grey it is, like the sea on a quiet cloudy day and mottled as if touched by a sudden breath of wind. Indeed, all marbles put me in mind at once of water, from the lustre and reflections of their polished surfaces, and the sides of rivers or a sea-front seem their natural places. This is, I think, the secret of the surpassing loveliness of Venice, that her walls harmonise perfectly with her waterways. Alabaster, pearly-tinted, and stained with brown, seems a treasure plundered from Neptune's palace.

Marble is not the the only material whose colour is destroyed by the city acids, for all the sandstones and limestones, with the exception of Portland, are veiled in soot within the space of a few years. Of course, the buildings near the parks, and those fronting the squares or a river are toned down rather than covered. Yet there remains the mass of a city, where offices are built up tier above tier, or the swarming human hives are erected. For the great thoroughfares and mean streets we must have recourse to materials which will stand the local murky climate; and glazed bricks, tiles, and terra-cotta will not only resist the acids of the atmosphere, but are capable of being washed and cleaned as often as need be. The chief reason for not employing them in our time is that they tend to make a building look common and reminiscent of lavatories and cheap bun shops. And also we have used glazed bricks of the crudest colours to build our shop fronts, in order to outdo in display the shop of our neighbour, who has only plain stone piers guarding his plate glass. A few architects have had the courage to use vitrified materials in a large way, and have created oases of gay and refreshing colour in the streets. Our gratitude is due as well to the craftsmen of the pottery factories, who have produced such glorious tints.

One glance at a house in Addison Road, Kensington, should convince sceptics that faience may be used without vulgarity. Here, on a base of common brown brickwork, stand white pilasters enclosing wall spaces of green bricks. Above the capitals rise white arches round rich blue walling, and bearing above them bands of pale green and white that are shadowed with a great projecting cornice. An attic runs round the house, a broad strip of blue glazed bricks cut up by white piers placed far apart, and helping to support another cornice to whose edge the green tiles come. All the constructive and enriched part of the design, piers and main arches and cornices, is of white faience, that not only emphasises the lines where the weight is borne, but shows to greatest advantage the rich modelling of capital and modillion and moulding. The plain spaces of walling are yet full of variety, the bricks not having all the same tone of green or blue, but light and dark mixed haphazard and without design. A delightful portico leads up to the house; the open part supported on unpolished columns, softly grey, which cut athwart the vivid greens of glazed tiles on the walled-in side.

Those of us who are enthusiasts for colour are apt to complain of the very small use made of glazed materials. Here, we say, are blues that will rival the peacock's plumage, or the sea, or the pale indigo of the evening sky. Here is red as deep and rich as the rose, or delicate as the eglantine; and the greens confuse us by the number of tints and tones. But, after all, it is as well to be cautious in the advance, so that failures in purity and harmony of colour may be the more likely to be avoided. It is the very variety of tones and tints that will constitute a great danger in the future; for a building that is a thing of beauty in a monotonous street, will look very different in chromatic surroundings. Hence we may prophesy discords and crude contrasts which the hand of time cannot heal. Our hope is that the planning and design of our streets will be under the control and subject to the advice of eminent and experienced architects, who will be able to blend the whole city together, even as nature brings all things into the scheme of her harmony.

Mosaic, too, has so far been little used in street architecture, and it is difficult to judge of its effect. There is, however, the small front of Pagani's restaurant, in Great Portland Street, London, which has been covered most delicately with light greens, yellows, and reds, and has the window openings defined by a line of blue. Panels of gold mosaic are set in various buildings in London, but I do not know one which looks well with brickwork. It should have more sympathy with marble or polished granite; and when once the surface was smudged and smeared with dirt and soot the gold might be subdued and soft, with high lights here and there where the sun caught it uncovered.

Such small necessities as knockers, locks, and hinges, will give piquancy to simple doors, by the contrast between their brightness and the dulness of the wood or paint. Copper surely is a material that may be used with good effect in city architecture, especially for domes and spires, harmonising so well as it does with the tender greys and blues of the English sky. Or if we prefer it, there is lead, not the modern material with all the silver washed out of it, but the lead as we see it on the roofs of Westminster Abbey and many another old building, where its silvery whiteness stands as a background to the dark stone pinnacles and parapets. Then the lead itself is capable of being endowed with as gorgeous colours as the craftsman can lay on.

Such, then, are the materials which may safely be displayed in the sootladen atmosphere of cities. Where clearer air prevails, it is still advisable to face most of the walling with bricks and stone rather than obtain large glazed surfaces each side of the street.

English architects, from the end of the fifteenth century, have been at the greatest pains to design harmoniously in brick and stone, with such success that this type of building expresses more than any the inherent geniality and homeliness of the English characer. In Tudor times, when brickwork was first widely used, it formed the mass of the wall, and possessed a decidedly purple tone, as that to the Gothic part of Hampton Court, and in the Cambridge streets, with patterns of black headers disposed in haphazard fashion. The window and door openings, also the copings and carving, were of stone of about the same tone as the brick, grey or brown in hue, so that there was little contrast between the two. And this quiet effect of colour seems to have been sought all through the war of styles during the reigns of Elizabeth and James. But as the architects of the Renaissance attained a fuller knowledge of the pure classical forms, they sought to express them by the vivid contrast of white stone against bright red brick, as in the garden fronts of Hampton Court Palace.

This tradition of red and white architecture has been handed down with little alteration to our own day, and the most successful modern buildings in London are erected in the style, such as New Scotland Yard, the offices of "County Life," in Covent Garden, and the Royal College of Science at Kensington. The only development which needs comment is the introtion of alternate bands of stone and brick, a new note entirely in accord with the general composition.

Granite is a truly noble substance for bases and plinths, whether red or grey in colour; Mount Sorrel setts are sometimes a mingling of the two tints, and form a pavement rich in hue, yet hard in tone. But it is misinterpreting the character of granite to lay it over softer-looking material, and, if polished, it should be used with marble rather than with soft-textured stone.

It is often difficult to catch the general tint of a stone building, and a surface that is yellow under the sun's rays turns to a green-grey as the clouds drift over. Broadly, it may be said that between the full red of Runcorn, the yellow of Ham Hill, and the blue of Pennant, there are all the indefinable colours that go to the making of an English sky.

There is also endless variety in the bricks that can be obtained even from one neighbourhood. At Highgate, in North London, the rubbers make a splash of light red over the windows, and an edging to the jambs, toothed into the main facework of rich purple that is laced with black pointing. A garden wall has the prevailing tint of brown, but is speckled and fretted with yellows and toned off to grey. The better class houses are maroon colour, the bricks being not all of the same tint, but full of variety, lightening to pink or taking a little soot from the atmosphere, and darkening to vandyke brown; and from unexpected places in this setting a few glazed headers shine.

Setting forth these materials, in joyful appreciation of the wealth of the earth, we may redeem the vast modern accumulations of factories, shops, and dwellings, and restore each into a city built at unity with itself, and developing an individuality and a character of its own. Then, in the busy centre, glazed walls will gleam through the smoke like chrysoprase and jasper, emerald and opal, jacinth and lapis layuli, whilst about them will stand the spires and towers, pure white, the sentinels of Heaven; round the wide parks and commons; lines of delicate stone will stretch tinged with yellow and grey, and flushed with the red of brickwork, mingled too with hues of serpentine granite and alabaster, with the polished marbles of Devon and Derbyshire, the precious stores of Carrara and Egypt, till the whole city will lie as a captured sunset above the sea.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

The querist's name and address must always be given, not necessarily for publication.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Corporation Claim to Dedication of Land.

SCARBOROUGH. — "Lonkley" writes:— "Plans for the conversion of the front of the ground floor of a dwelling house into a shop have been deposited with the authorities, and have been disapproved owing to the fact that the owners will not enter into an agreement with the Corporation to dedicate to the public, the land hatched in on the plan and marked 'D.' The authorities will not give their consent to the plans, and say that if the building is erected it will come within section 156 of the Public Health Act. The house forms one of a terrace of dwelling houses with bay windows. All the adjoining houses are now converted into shops, and occupying the line of the former bay windows. The new portion is carried about twelve feet above the footpath, so that the outer wall of the first and second storeys remain as before. Please say whether the Corporation are within their rights?"

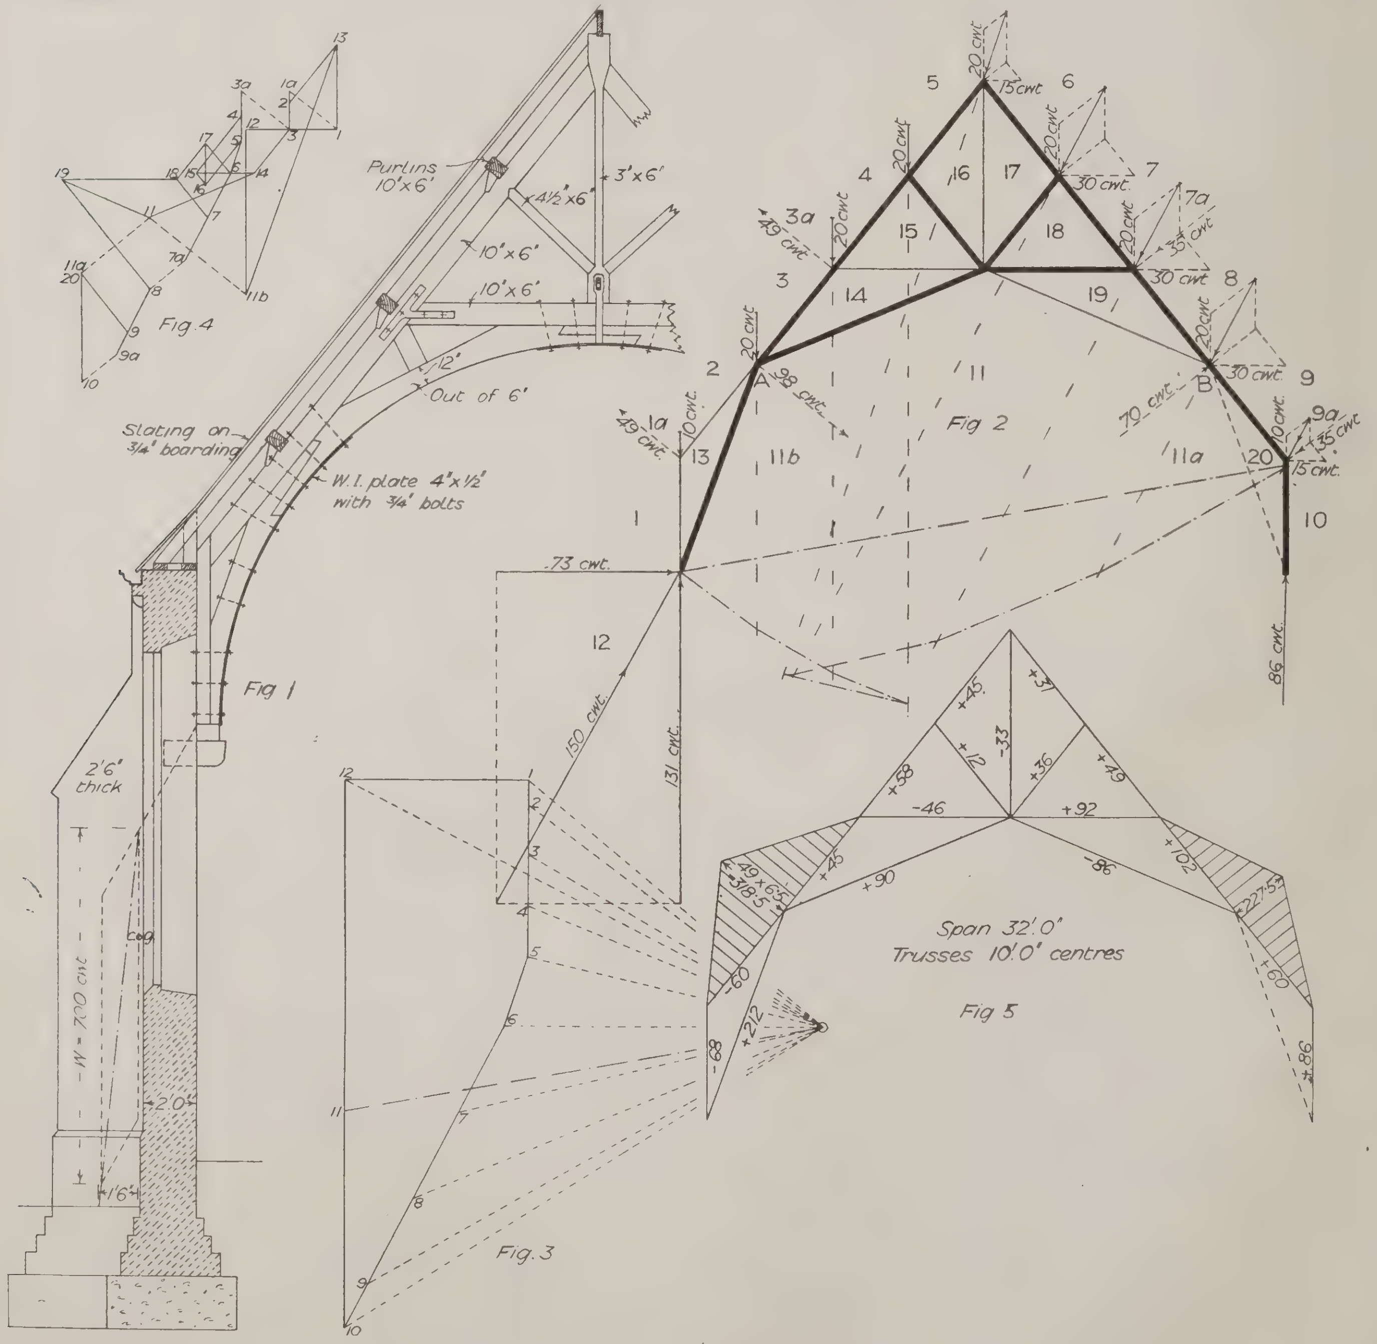
I am of opinion that the sanitary authority are wrong in refusing to pass the plans as you describe them, and that they have no legal right to enforce the bargain they suggest; although it certainly does appear to me that the owners would be well advised in dedicating the hatched strip of land, and so making the footway uniform and easy of access to their own premises, as well as for the use of the public generally. This strip can be of no possible use to the present owners, because they can never build upon it. The Local Improvement Act you quote does not apply to this case, because there is no question of a building line having been specially set out, nor has the question of purchase by the local authority arisen. The case certainly comes under section 3 of the Public Health Act, 1888, but (as I have always seen that section interpreted) this gives you the right to bring forward your building to the same frontage line as the properties on either side. Your remedy is to apply to the High Court for a "mandamus," but this involves costs, and I am bound to confess I think you will do better to accept the terms offered by the corporation.

F. S. I.

Design for Braced Collar Beam Roof.

DUBLIN.—"L.," writes:—"(1) I shall be obliged if you can inform me if there is any statical method by which the stresses in a roof of this type (sketch enclosed) [not reproduced], and the necessary buttress to resist same can be calculated? (1) Can the truss be taken as rigid and the buttress to resist the thrust of wind pressure only?"

The design for roof submitted is shown, with the necessary corrections, in Fig 1. The frame diagram will be as in Fig. 2, and taking the structural load at 28lbs. per ft. sup. and the horizontal wind pressure at 42lbs. per ft. sup., the loading will be as shown. Set down the load line in Fig. 3, and by means of a funicular polygon find the reactions, assuming that the whole of the horizontal thrust comes on the left-hand abutment. In order to work out the stress diagram virtual forces must be introduced as shown by the dotted lines in Fig. 2, being obtained by taking moments about points A and B, for example



ILLUSTRATING REPLY TO "ARCHITECT," DUBLIN.

$(131\times4)+(x\times6{\cdot}5)=(10\times4)+(73\times11)$, whence $6{\cdot}5x=319$ or $x=49$ cwt. and in order to preserve equilibrium, force 3—3*a* must be added, and force 11—11 lb. to balance the other two. The virtual forces on the other side may be worked out in a similar manner by taking moments about B, and it will then be found that the complete stress diagram, Fig. 4, may be easily constructed. The stresses should next be scaled off and marked on the outline diagram Fig. 5, together with the bending moments which take the place of the virtual forces in the actual truss. Considering the principal rafter at point A, the maximum compression will be 102cwts. and the bending moment 318.5 cwt.—ft., the full section at this point consisting of two 6in. by 10in. timbers, with a 4in. by ½in. plate bolted on. Then, allowing for the plate and deducting one ¾in. bolt hole, the distance of neutral axis from bottom of plate =

$$\frac{(52{\cdot}5\times15{\cdot}5)+(52{\cdot}5\times5{\cdot}5)+(30\times1{\cdot}625\times25)}{52{\cdot}5+52{\cdot}5+(30\times1{\cdot}625)}$$

$=7{\cdot}3$ in. Then $20{\cdot}5-7{\cdot}3=13{\cdot}2$, and $13{\cdot}2\times2=26{\cdot}4$, which may be taken as the virtual depth of section taken as timber only.
The maximum stresses will be

$$\frac{W}{A}\pm\frac{M}{Z}=\frac{102}{153{\cdot}75}+\frac{318{\cdot}5\times12}{\frac{1}{6}(6\times26{\cdot}4^2)}=0{\cdot}66+5.48=$$

6.14 cwt. per sq. in compression and 4.82 cwt. per sq. in tension. For the curved member, consisting of a 12in. by 6in. section, with a 4in. by ½in. plate, the distance of neutral axis from bottom of plate =

$$\frac{(63\times6{\cdot}5)+(30\times1{\cdot}625\times{\cdot}25)}{63+(30\times1{\cdot}62)}$$

$=3{\cdot}7$; $12{\cdot}5-3{\cdot}7=8{\cdot}8$ and $8{\cdot}8\times2=17.6$in. as the virtual depth of section. Then

$$\frac{W}{A}\pm\frac{M}{Z}=\frac{212}{111{\cdot}75}\pm\frac{212\times11{\cdot}5}{\frac{1}{6}(6\times17{\cdot}6^2)}=1.9\pm7{\cdot}9=$$

9.8 cwt. per sq. in. compression and 6 cwt. per sq. in. tension, which will be within safe limits. The other members will be as marked on Fig. 1. As the trusses are 12ft. centres, in finding the stability of the walls 6ft. run only should be taken as a maximum, to allow for window openings. Find the weight of wall and buttress and combine with the reaction on left-hand side of truss, giving the resultant which cuts the ground line at 1ft. 6in. from the centre of gravity of base. The section modulus of base will be

$$Z=\frac{(BD^2-bd^2)^2-4\,BD\,bd\,(D-d)^2}{6(BD^2-bd^2)}=\frac{(6\times5{\cdot}5^2-3{\cdot}5\times2{\cdot}5^2)^2-4\times6\times5{\cdot}5\times3{\cdot}5\times2{\cdot}5\times2^2}{6(6\times5{\cdot}5^2-3{\cdot}5\times2{\cdot}5^2)}$$

$=22$. Then $\frac{W}{A}\pm\frac{M}{Z}=\frac{700}{20{\cdot}75}\pm\frac{700\times1{\cdot}5}{22}=33.7\pm48=81{\cdot}7$ cwt. or 4.08 tons per sq. ft. compression, and 14.3cwt. or 0.71 tons per sq. ft. tension, so that the buttress will be sufficient.

HENRY ADAMS.

Walls for Swimming Pond.

CASTLEFORD.—"W. F. C." writes: "What thickness of brick wall is required for a swimming pond, size 75ft. by 30ft., water 6ft. 6in. deep at one end and 3ft. at the other? A passage surrounds the bath, the floor of bath being 1ft. above floor of passage at deepest end, and 4ft. 6in. at the other end? A smaller bath, size 28ft. by 14ft. and 2ft. 4in. by 3ft. deep is required, with passage as above, floor of pond being 5ft. above floor of passage. Can any formula be used for calculating the above? Would reinforced concrete be cheaper than brick, and whose system would you recommend? Can the walls be made water-tight without using special keyed brick linings and asphalte; can ordinary glazed bricks or tiles be used with safety? What thickness of concrete is required for the floors, and what thickness if reinforced, and how?"

Each foot run of the wall may be taken as a vertical girder resisting the thrust of earth and water, and supported at the ends. If the wall is built in brick-work set in 1 to 3 Portland cement mortar, with the facing bricks glazed, or of Portland cement concrete, 1 cement, 2 sand, 4 broken stone faced with glazed tiles, the thickness should be, say, 14 inches. The following method of working will give an approximate result by which the thickness is determined:—Fig. 1 shows the face of wall at the shallow end, where the water is 3ft. deep, and as this water will press down on the earth an amount of earth equivalent to this pressure must be assumed to be added to the wedge of earth already acting say, half the depth of the water. Then, assuming the natural slope at 40 degrees, the total thrust will be

$$T=\tfrac{1}{2}w\,h^2\tan^2\frac{90-\phi}{2}=\tfrac{1}{2}\times93{\cdot}75\times6^2\times{\cdot}4663^2$$

$=367$ lbs., and the ordinate at base of triangle of pressures $=\frac{367\times2}{6}=122$ lbs. The water pressure will be $\frac{1}{2}wh^2=\frac{1}{2}\times62{\cdot}5\times3^2=281$ lbs. and the ordinate at base of triangle of pressures $=\frac{281}{3}\times2=187{\cdot}5$ lbs. as shown in Fig. 1. The complete loading is shown in Fig. 2, and it should be divided up into any convenient number of parts, and the weight of each part found. Set down these loads as in Fig. 3, and select the pole O say 3ft. from the load line and draw vectors to the various points in the load line. Parallel to these vectors across their respective spaces draw the bending moment diagram, Fig. 4. The scale for the bending moments will be the load scale in lbs. per inch by distance from pole to load line in feet, which will give lb.—feet per inch, and the maximum bending moment may then be scaled off. The maximum allowable tensile stress on Portland cement mortar is 2 tons per sq. ft., then

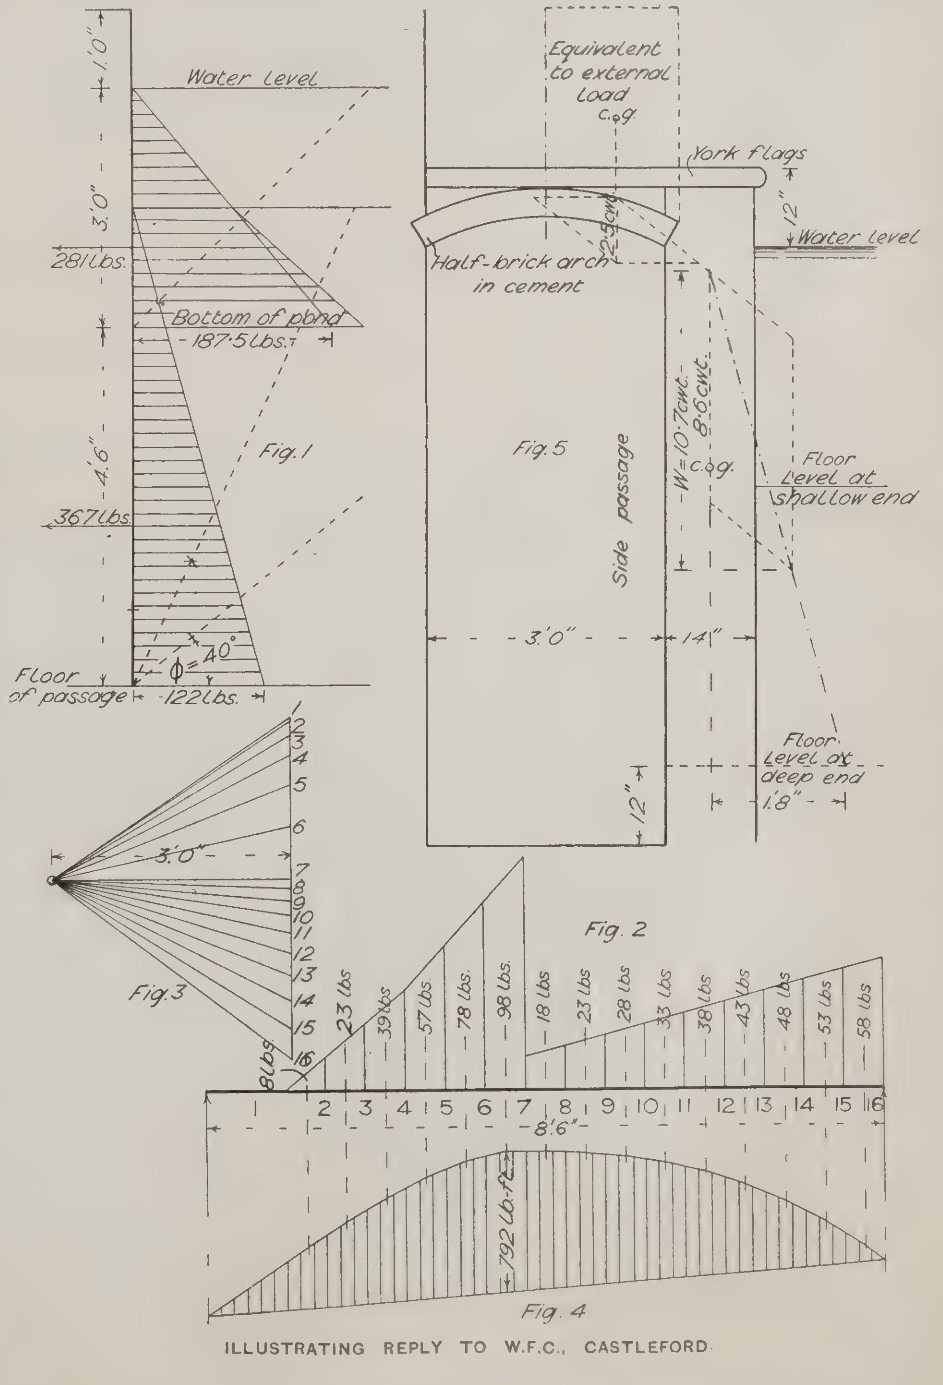
$\frac{M}{Z}=2$, or $\frac{M}{\frac{1}{6}(1\times d^2)}=2$, whence $M=\frac{1}{3}(1\times d^2)$,

$\frac{792}{2240}=\frac{1}{3}d^2$, whence $d^2=\frac{2376}{2240}$ or $d=\sqrt{1{\cdot}06}$ $=1{\cdot}03$ ft., say 14 in. wall.

The complete wall may now be drawn out as in Fig. 5 and the stability of wall against the pressure from arch when the bath is empty must be ascertained. Assume the external load at 1cwt. per ft. sup. and the structural load at ½cwt. per cub. ft., then by parallelogram of forces find the trusts at crown and springing. Combine the trust at springing with the weight of wall giving the resultant cutting the base at 1ft. 8in. from the centre of wall. Then

$$\frac{W}{A}\pm\frac{M}{Z}=\frac{10{\cdot}7}{1{\cdot}125}\pm\frac{107\times1{\cdot}66}{\frac{1}{6}(1\times1{\cdot}125^2)}=9{\cdot}5+84{\cdot}5=94$$

cwt. or 4·7 tons per sq. ft. compression, and 75cwt. or 3.75 tons per sq. ft. tension, at the deep end when the bath is empty. This is assuming that the arch consists of loose blocks, but the cohesion between the



ILLUSTRATING REPLY TO W.F.C., CASTLEFORD.

bricks would reduce the tensile stress to safe limits. If the passage is wider than 3ft., the stress will be greater, and then instead of arching it over, rolled joists must be used.

HENRY ADAMS.

Architects of Municipal Buildings and Town Halls.

DUDLEY.—"W. T." writes: "Please supply the names of about half a dozen architects who have lately won competitions for municipal buildings and town halls."

Town Halls, chiefly the result of competitions, have been recently opened or are in course of construction as follows:—(1) Chelsea, architect, Mr. Leonard Stokes; (2) Glamorgan County Hall, architects, Messrs. Harris and Moodie; (3) Holborn, architects, Messrs. Warwick and Hall; (4) Radcliffe, architects, Messrs. Gillow and Holt; (5) Shoreditch, architect, Mr. A. W. S. Cross, M.A.; (6) Stockport, architect, Sir Brumwell Thomas.

Books for Intermediate Examination.—R.I.B.A.

CUMBERLAND.—"W. W. B." writes: "Seeking books to study for the Intermediate Examination of the R.I.B.A., I have had offered secondhand Anderson's "Architecture of Greece and Rome" for 10s. It is 1st edition, 1902. The 2nd edition costs 18s. new. Which do you advise? Blomfield's "History of the Renaissance in England," 2 volumes, is offered for 35s. These are £2 10s. new. I can get an abridged edition, new, for 7s. 6d. Would buying "Practical Plane and Solid Geometry, including Graphic Statics," by J. Harrison, at 3s. 6d., be as suitable as Angel's Geometry at 5s., and Hardy's Graphic Statics, at 3s. I also need Bond's "Gothic in England," 31s. 6d.; Anderson's "Arch. Renaissance in Italy," 12s. 6d.; and Fletcher's History of Architecture," 21s.; and Farrow's "Stresses and Strains," 5s.; Gotch's "Early Renaissance in England," 21s. These are expensive books, and I should have liked to get them second-hand; but I should prefer to spend rather more and get the proper thing than to get the cheaper article now and be bound to get the others later."

The opinion expressed by our correspondent at the end of his letter is to be strongly endorsed, viz., that it is "better to spend a larger sum and to get the proper thing"; and our advice would also include a rider to this axiom—it is better, when buying books for the intermediate examination, to consider, not only the final examination, but also the value of having good books at hand for future reference. Hence we should give preference to the latest edition of Anderson and Spiers' "Greece and Rome" (though the earlier edition is, perhaps, as satisfactory for use for the intermediate examination). Also to the larger edition of Blomfield's "Renaissance in England," at 35s., as the illustrations will be found more satisfactory. It is not necessary to have a large book on geometry; Harrison's will, we believe, be found quite satisfactory. Anderson's "Italian Renaissance" should certainly be acquired, but it is at the moment out of print, and it would be well to await a new edition. "Gothic Architecture," by Francis Bond, is well worth buying as a valuable book of reference. "Fletcher's History" is a most useful text book; we doubt whether either of these last two is obtainable second-hand, except by chance (the earlier editions of the "Fletcher's History" are hardly to be recommended). The other three books mentioned will be found useful. The best plan is, however, to keep a list of books to be bought, and to buy only as found necessary or as opportunity offers.

B. AND B.

Constructing a Baker's Oven.

LONDON, W.C.—"Zero" writes:—Will you be good enough to tell me how a baker's brick oven is constructed? The plan is circular. I want a section to show flue and construction of fire beneath, with height from floor, etc. Please also state what iron fittings are necessary."

The ordinary cottage oven for baking consists merely of a closed chamber paved and domed in brick. There is an open flue immediately over the opening to take the smoke, which would otherwise come straight out of the door into the room. This flue connects with the main chimney flue higher up, and there are no special details necessary beyond the provision of a sufficient draught to cause the smoke to travel up the flue. The only iron fittings consist of a flat plate furnished with handles for removing it. It merely rests against the framing, and is not hinged or fastened—unless, indeed, there be lugs to keep it securely in its position in the throat of the oven mouth."

F. S. I.

County Council Valuer.

SHREWSBURY.—"X. Y. Z." writes:—"Please give detailed particulars of the duties devolving upon a valuer appointed by a county council under the Finance Act."

I am not aware of any valuer who is appointed by a County Council under the Finance Acts. Are you referring to the valuers who are appointed under the Small Holdings and Allotments Act, 1907? These gentlemen are nominated by a county council, and their duties are laid down by the council appointing them. Speaking generally, those duties are to enquire into any applications which are made for small holdings, to enquire as to what lands are available, by private treaty or otherwise, to meet those demands, and subsequently to hold enquiries on the spot if it be necessary for the county to rent or purchase land.

F. S. I.

Floor for a Roller Skating Ring.

LIMPSFIELD, SURREY.—"Abingdon" writes: "Referring to 'Experience's' letter in your issue of January 13th, permit me to say, as an old roller skater, that the floor of the immediate future will be a resilient one, such as the subject of a recent patent, whereby the floor, constructed of oak or maple boarding on timber joists, is carried upon lines of light steel girders in short lengths, supported on steel spiral springs. The whole floor is thus held in suspension, and 'gives' to the movement of the skater instead of resisting his power."

Liability of Sub-contractors.

BEDFORDSHIRE.—"Granite" writes:—"I shall esteem it a great favour if you can inform me whether a sub-contractor is liable under the Workmen's Compensation Act to compensate any of his men who may meet with an accident during employment? The sub-contractor whom I am alluding to is a master plasterer, and in his system of contracting he only supplies 'labour,' not materials, which are, as customary in this district, provided by the builder. The legal point of the question is so complex, yet very interesting, and also one of great importance, that your answer will be looked for with great interest, both by myself and others of the building trades."

Certainly the sub-contractor is legally liable to compensate any of his men who meet with accidents while in his employ, but the workman has also a legal claim against the principal contractor also, this provision, no doubt, being intended to protect the workmen against "men of straw" as sub-contractors. Clause 4 of the Workmen's Compensation Act, 1906, reads:—"(1) Where any person (in this section referred to as the principal), in the course of or for the purposes of his trade or business, contracts with any other person (in this section referred to as the contractor) for the execution by or under the contractor of the whole or any part of any work undertaken by the principal, the principal shall be liable to pay to any workman employed in the execution of the work any compensation under this Act which he would have been liable to pay if that workman had been immediately employed by him; and where compensation is claimed from or proceedings are taken against the principal, then, in the application of this Act, references to the principal shall be substituted for references to the employer, except that the amount of compensation shall be calculated with reference to the earnings of the workman under the employer by whom he is immediately employed. Provided that, where the contract relates to threshing, ploughing, or other agricultural work, and the contractor provides and uses machinery driven by mechanical power for the purpose of such work, he and he alone shall be liable under this Act to pay compensation to any workmen employed by him on such work. (2) Where the principal is liable to pay compensation under this section, he shall be entitled to be indemnified by any person who would have been liable to pay compensation to the workman independently of this section, and all questions as to the right to and amount of any such indemnity shall in default of agreement be settled by arbitration under this Act. (3) Nothing in this section shall be construed as preventing a workman recovering compensation under this Act from the contractor instead of the principal. (4) This section shall not apply in any case where the accident occurred elsewhere than on, or in, or about premises on which the principal has undertaken to execute the work or which are otherwise under his control or management." You may purchase the Act itself for threepence.

F. S. I.

Smoky Chimney.

CARNARVON.—"L. L. J." writes: "A client has had a house built by a contractor under my supervision. A clause of the contract provides for the remedying of any defect that might become apparent in three months after completion. Five flues are carried up in an outside gable wall, three from the ground floor and two from the first floor. The wall is of stone, plastered on the inside and cemented on the outside. When a fire is lit in the scullery the bedroom above is filled with smoke, but we have failed to find from where it comes. When the parlour fire is lit the smoke comes from under the scullery boiler flue. All the flues are far apart until they are gathered to the stack. Other flues (four) in the other gable give no trouble, and I cannot suggest jerry building. The nuisance is at its worst on calm days, and when there's a breeze the trouble does not make itself apparent. The open fire of the scullery suffers from down draught occasionally. The pots are ordinary tall round pots. The building stands on clear ground, with two or three trees some forty feet away. Can you suggest what is the cause of the mischief? Is it right to hold the contractor liable to remedy the mischief? Can my client compel the contractor to open to and examine the flues"

We cannot see that there can be any other cause for the trouble you mention than some defect in the flues, and this may be due to want of proper workmanship in building flue partitions, i.e., the joints in the stonework are not properly filled up, and, further, that it is probable the flues have not been properly pargetted. If the flues were carried up and were perfectly smoke-tight, there could not possibly be any leakage from one room to another. Possibly the trouble is due to defects in covering over the chimney openings. This, however, would not seem to apply in the case of the parlour fireplace, as the difficulty there must be somewhere close to the ground level. The question of down draught in the scullery might be cured by one of the many patent anti-down draught chimney-pots, and we presume that the chimney from this is of the same height as the others. The "Edwardian" pot of Messrs. Homan and Rodgers has proved very efficacious in dealing with down draughts. This is an ordinary terra-cotta pot. If your contractor is liable for defects under the term of his contract, we certainly think you can compel him to open up the flues of likely places and examine them for defects.

THE STABILITY OF WALLS.*

By Henry Adams, M.Inst.C.E., etc., Member of Council, The Society of Architects.

In order to bring the subject of stability of walls within the limits of time permissible in a single evening it is proposed to deal only with one class of walls, viz., those known as boundary, enclosure, or fence walls, which have no load but their own weight to support, and no thrust but that produced by the wind to resist. They are not of great importance in themselves, but they will serve as a medium for the introduction of the general principles of determining stability, and save our time when we consider more important cases on a future occasion.

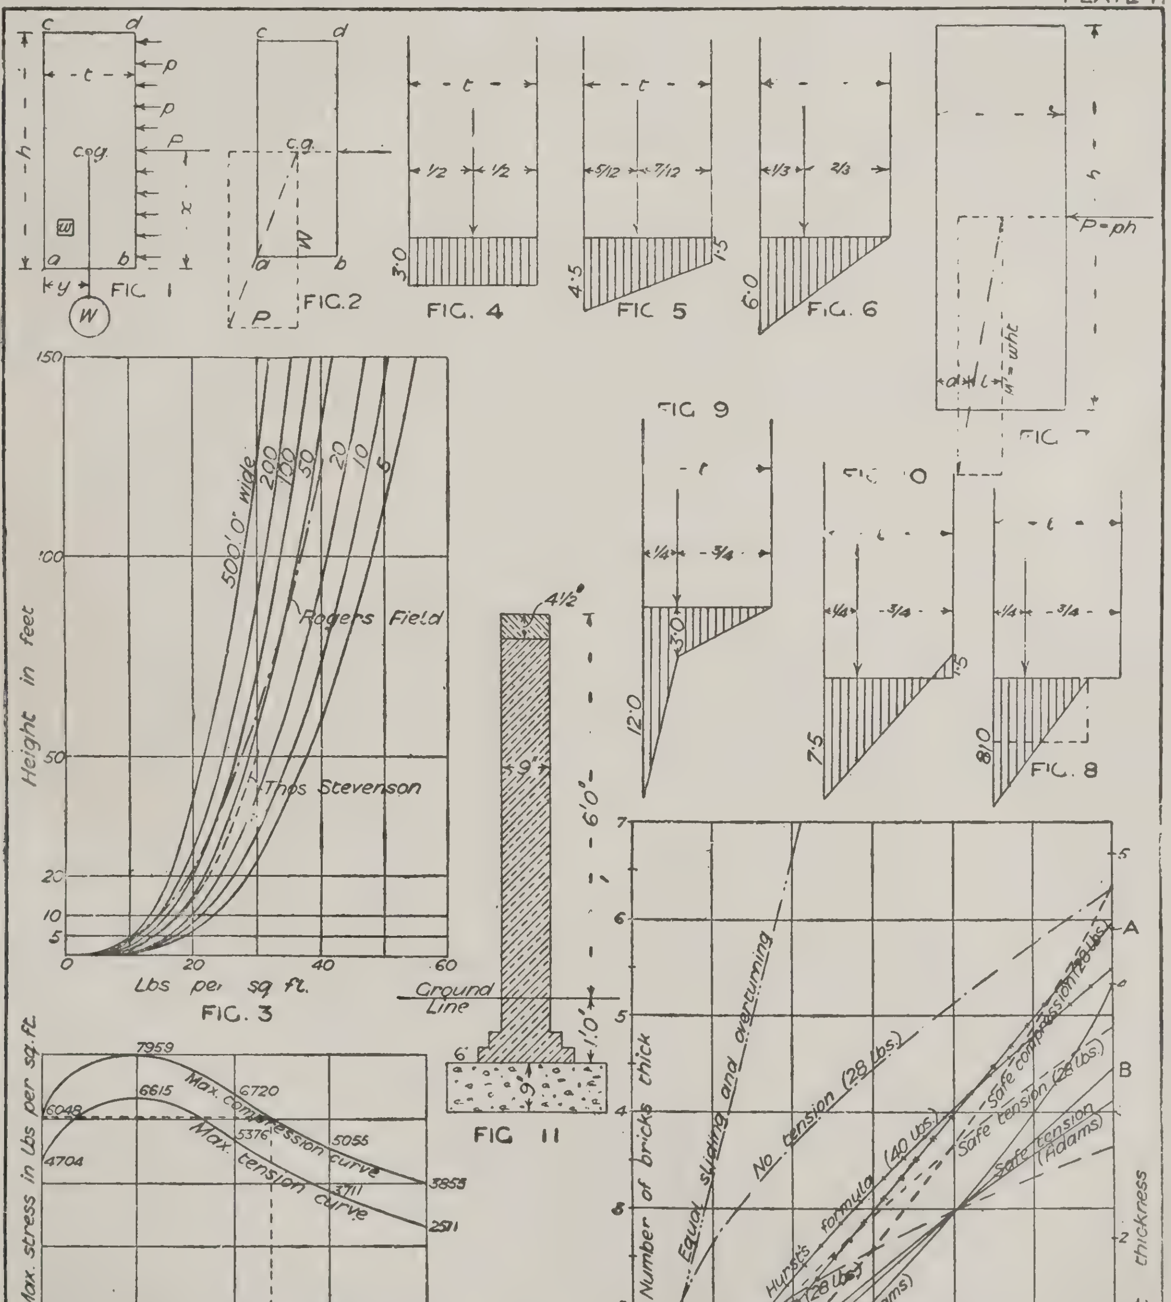
The Main Principle.

By making one or two assumptions the main principle can be shown very easily, but in the application of this principle to practice there are various points open to discussion, and the actual stability is by no means so certain as might generally be supposed. To make the subject perfectly clear, we will commence with a simple wall of uniform rectangular section, assuming that the wind is blowing horizontally and uniformly over one face, that there is no tensile strength in the mortar, and that the wall would ultimately fail by overturning on the outer edge at the ground line without crushing the edge.

Let a b c d (Fig. 1) be the section of wall, and as the reasoning that applies to one foot of its length applies to every foot, it will be convenient to consider a length of 1ft. run. Then the total force of the wind will be the pressure per sq. ft. by no. of sq. ft. (i.e., the height, because we are only considering 1ft. of the length), and the centre of action will clearly be at half the height, the leverage to overturn the wall on point a will thus be x. It is not the distance measured from the point of P diagonally down to point a, because the leverage of any force must be measured from the fulcrum perpendicularly to the direction of the force. The wall being of uniform substance and rectangular in section, the centre of figure will be the position of the centre of gravity, marked c.g., where the whole weight may be considered as acting. This weight W is the weight per cubic foot by no. of cub. ft. (i.e., the height by the thickness, the length

PAPER ON STABILITY OF WALLS.

PLATE I.



---

*Substance of a paper read by Prof. Henry Adams, M.Inst.C.E., etc., before the Society of Architects, on January 14th.

being 1 foot), and its leverage, resisting the overturning on a, will be y. It is assumed that there is no tensile strength at point b to hold the inner edge down, as when the wall is new the cohesion of the mortar cannot be relied upon.

Let p = wind pressure per sq. ft. in lbs.
w = weight per cub. ft. of wall in lbs.
h = height of wall in feet.
t = thickness of wall in feet.
P = total wind pressure in lbs.
W = total weight or resistance in lbs.
x = leverage of wind in feet.
y = leverage of resistance in feet.

then

$P = p\,h$, $x = \frac{1}{2}h$, Px = moment of wind pressure,
$W = w\,h\,t$, $y = \frac{1}{2}t$, Wy = moment of resistance,

and by the laws of equilibrium $P\,x = W\,y$, therefore

$$p\,h \times \tfrac{1}{2}h = w\,h\,t \times \tfrac{1}{2}t, \text{ or } p\,h^2 = w\,t^2,$$

whence

$$p = \frac{wt^2}{h} \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad (1)$$

$$h = \frac{wt^2}{p} \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad (2)$$

$$t = \sqrt{\frac{ph}{w}} \quad \ldots\ldots\ldots\ldots\ldots \quad (3)$$

If we consider the wind pressure which will just overturn the wall as the measure of stability, then the stability of such a wall varies as $\frac{wt^2}{h}$, or directly as the weight per cube foot, inversely as the height, and directly as the square of the thickness.

Parallelogram of Forces.

This may be shown by parallelogram of forces as in Fig. 2. Draw to any scale the outline of section *a b c d*, and mark the position of centre of gravity; draw a line vertically through the centre of gravity equal in length to the total weight W upon any given scale, measuring from the line of direction of the resultant of the wind pressure, which in this case will pass through the centre of gravity of the wall; at its extremity draw a horizontal line of indefinite length, then from the centre of gravity draw a line through point a to cut the horizontal line, and P will be the total wind force, or $\frac{P}{h}$ the wind force per sq. ft. to just overturn the wall. The other lines forming the parallelogram, and shown dotted, are frequently omitted.

Suppose a standard be taken of 112lbs. per cub. ft. for weight and 28lbs. per sq. ft. for wind pressure, then by formula (2) for simple overturning, a wall

1ft. thick would be 4ft. high.
2ft. thick would be 16ft. high.
3ft. thick would be 36ft. high.

or the height of any wall would be 4 times the square of the thickness . . . . . (4) which for various reasons would not accord with practice.

Resistance to Sliding.

There is another contingency which is theoretically possible, viz., that the wall instead of overturning, may slide on the bed joint. The resistance to sliding depends upon the weight and the nature of the surfaces in contact; it is directly proportional to the weight multiplied by a fraction called the "co-efficient of friction," varying with the surface. If the mortar has any cohesive strength this co-efficient of friction would merge into the resistance of the mortar to shear stress.

Let μ = the co-efficient of friction, then for equilibrium $P = W\mu$, or $p\,h = w\,h\,t\mu$, whence $p = w\,t\mu$ . . . . (5)
It is evident that there must be a certain proportion of thickness to height where the tendency to overturn or slide would be equal; this will be when $\frac{wt^2}{h}\,(1) = wt\mu(4)$,

or, by cancelling, when $\frac{t}{h} = \mu$ . . . . . (6)

that is, when the ratio of thickness to height is equal to the co-efficient of friction, and this being 0.5 for fresh mortar, it would require the wall to be only twice the thickness high.

Basis of Practical Calculations.

Now, unfortunately, when we come to apply these elementary principles to practice, we are beset by difficulties on every hand, and although an architect's innate sense of fitness may enable him to provide a suitable section for a wall of any height there are times when he should be able to give a reason "for the faith that is in him," and to do so it will be necessary to make various digressions to ascertain the basis upon which practical calculations must rest.

Walls have been designed so that the overturning moment shall not exceed one-half to two-thirds that which calculation would show to be necessary to produce overturning, but this is a very crude and improper mode of designing, and the author will now endeavour to indicate the true basis upon which it should proceed.

Strength and Weight of Materials.

These will vary considerably according to individual samples, but an average may be taken as follows:—

Material.	Safe dead load per ft. sup.	Factor of Safety.	Weight in lbs. per cub. ft.
Granite masonry	15 ...	20 ...	160
Portland and hard limestone	15 ...	15 ...	140
Sandstone well bedded	12 ...	10 ...	130
Blue brick in cement ...	9 ...	8 ...	120
Stock brick in cement	6 ...	5 ...	115
Ditto in Lias mortar...	5 ...	4 ...	112
Ditto grey lime mortar	3 ...	4 ...	112
Portland cement concrete	5 ...	8 ...	130
Lias lime concrete	3 ...	8 ...	120
Gravel and natural compact earth	2 ...	— ...	112
Made ground rammed in layers	1 ...	— ...	110

The safe compressive loads given above vary from one-fourth to one-hundredth of the ultimate resistance: the factor of safety is calculated from the load at which fracture commences. It is necessary to allow a large margin for contingencies, and the figures named agree fairly with ordinary practice.

Strength of Mortar.

The safe tensile strength of old grey lime mortar may be taken at 1 ton per sq. ft. the co-efficient of friction, including resistance to shear, in fresh mortar joints according to different authorities = 0.5 to 0.75 of the load. The shearing strength of old mortar may be taken at two-thirds ton per sq. ft. The author of "Notes on Building Construction" gives the safe tensile strength as follows:—

	Per sq. in.	Per sq. ft.
Brickwork in cement fresh	0·5 cwt. =	3·6 tons.
,, ,, 6 months old ...	2 cwt. =	14·4 ,,
,, lias lime, fresh	0.1 cwt. =	0.72 ,,
,, ,, 6 months old ...	36 lbs. =	2.314 ,,

A maximum pressure of 10 tons per sq. ft. is sometimes allowed on brickwork at the overturning edge, but it must be remembered that crushing may commence with this pressure.

Clay as a Foundation.

No mention has been made of clay as a foundation, as no single figure can express its value; very much depends upon circumstances. In deep foundations, say exceeding 10ft. from surface, the London clay will bear 5 tons per foot super. safely. In shallow foundations a pressure of 1½ tons per foot super. would be reasonable, but in such a case it is not compression of the subsoil that is to be feared; the alternations of drought and moisture cause alternate contraction and expansion of the clay, and a movement of the superstructure is certain to follow, unless special precautions have been taken, more particularly where the surface is sloping, as on a hill-side.

Wind Pressure.

The pressure of wind against a plane surface perpendicular to its direction is not yet fully understood. It is, of course, a product of the velocity, but it varies according to laws which have not yet been reduced to correct formulæ, even if it be possible ever to arrive at more than a vague generalization. From the experiments which have been made, it appears that surfaces of a few feet area give a greater resistance per unit of area than smaller surfaces, and that very large surfaces are never subject to a uniform pressure over their whole area, so that the mean pressure is again reduced. It has been generally assumed that the force varies as the square of the velocity, and that the effect depends solely upon the area of the resisting plane. Pressures equivalent to 60lbs. and even 80lbs. per sq. ft. have been recorded in England, but 56lbs. is probably ample to allow for under any circumstances, and it is doubtful whether this has ever been actually reached. Half this amount, or 28lbs. per sq. ft., is enough to allow in rough calculations for boundary walls and similar structures near the ground level, unless in an unusually exposed situation.

The following table shows the average classification of wind force collated from various sources:—

Average Classification of Wind Force.

Description,	Velocity in miles per hour.	Approximate corresponding pressure lbs. per sq. ft.
Barely perceptible wind ..	$2\frac{1}{2}$	$\frac{1}{32}$
Light breeze	5	$\frac{1}{8}$
Pleasant breeze	$7\frac{1}{2}$	$\frac{1}{4}$
Good breeze	10	$\frac{1}{2}$
Strong breeze	15	$1\frac{1}{8}$
High wind	20	2
Half gale	30	$4\frac{1}{2}$
Strong gale	40	8
Whole gale	50	$12\frac{1}{2}$
Great storm	60	18
Hurricane	80	32
Violent hurricane	100	50

By Smeaton's formula, $p = \frac{v \text{ miles per hour}}{200}$

The pressures given in this table, although usually accepted, are only approximately correct, as at and near the critcal point of, say, 1,100ft. per sec., the resistance is in a much higher ratio than v^2 while below 100ft. per sec., it is more nearly as the velocity simply.

Empirical Formula for Wind Pressure.

The author has given considerable attention to the subject of wind pressure, and its modification according to the width and height of the surface exposed to its force. He has constructed the following empirical formula for practical use where it is desirable to obtain the closest approximation to actual conditions, viz.:—

$$\log p = 1{\cdot}125 + 0{\cdot}32 \log g - 0{\cdot}12 \log l \quad (7)$$

where p = ultimate wind pressure in lbs. per sq. ft. necessary to be allowed for against a plane surface perpendicular to the direction of the wind.
g = height of centre of gravity of surface considered, above ground level in feet.
l = width in feet of part to be taken as one surface.

This would give allowances as in the following table, for which the curves are plotted in Fig. 3:—

Wind Pressure lbs. per sq. ft. on Plane Surface.

Height in feet.	Length in feet.						
	5	10	20	50	100	200	500
150	54.6	50.3	46.3	41 4	38.1	35.1	31.4
100	48.0	44.2	40.7	36 4	33.5	30.8	27.6
50	38.4	35.4	32 5	29.1	26.8	24.7	22.1
20	28.7	26.4	24.3	21.7	20.0	18.4	16.5
10	23.0	21.1	19.5	17.4	16.0	14.8	13.2
5	18.4	17.0	15.6	13.9	12.8	11.8	10.6

(For very exposed positions 25 per cent. may be added.)

For additional notes on wind pressure by the present writer, reference may be made to his papers, "Wind Pressure on Roofs," read before the Society of Architects in 1893, and "The Force of the Wind," read before the City of London College Science Society in 1895. Reference may also be usefully made to a Report by the Director of the Meteorological Office, Official No. 180, entitled "The Beaufort Scale of Wind Force," 1906.

Combination of Weight and Wind Pressure.

The weight of a plain wall of rectangular section produces a uniformly distributed load over the base, and a horizontal wind blowing against it adds nothing to the weight, but throws the resultant of the forces over to the leeward side and alters the distribution of the loading, reducing it on the side next the wind, and increasing it to a similar extent on the opposite side, so that the sum total of the reactions remains the same. Fig. 4 shows the reaction when the resultant is in the centre, Fig. 5, when it has been forced out of the centre, but not so far as the middle third, and Fig. 6 when it just reaches the limit of the middle third. At this point, it will be seen that the pressure is reduced to nothing on the inside and increased to double the mean on the outside. It is generally stated that this position of the resultant is the limit for safety, but it is an incorrect expression to use. The limit of the middle third only signifies that there will be no tension on the inner edge, the compression on the outer edge will vary according to the load, and may exceed the limit of safety. On the other hand, the middle third may often be passed without exceeding the limit of safety. Adopting the notation already given, the weight of the wall will be $W = w\ h\ t$, and the area of base for 1ft. run $A = t \times 1$, the mean pressure on the base will then be

$$\frac{W}{A} = \frac{wht}{t}\ w\,h \ldots\ldots\ldots\ldots\ldots\ldots (8)$$

and the maximum pressure when the resultant is at the edge of middle third

$$\frac{2W}{A} = 2\,w\,h \ldots\ldots\ldots\ldots\ldots\ldots\ldots (9)$$

The position of the resultant will be found by reference to Fig. 7 where $w\ h\ t : p\ h :: \frac{1}{2}h : l$,

$$\text{whence } l = \frac{ph \times \frac{1}{2}h}{wht} = \frac{1}{2}\frac{ph}{wt} \ldots\ldots\ldots\ldots (10)$$

$$\text{and } d = \frac{1}{2}\frac{ph}{wt} - \frac{1}{2}t = \frac{1}{2}\left(\frac{ph}{wt} - t\right), \ldots\ldots (11)$$

By the same figure it will be observed that when the resultant is pushed over to the edge of the middle third $p\,h : w\,h\,t :: \frac{1}{6}\,t : \frac{1}{2}\,h$ whence

$$p = \frac{wt^2}{3h} \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (12)$$

When the wind pressure is sufficient to cause the resultant to cut the base beyond the middle third there are two possible conditions, (a) owing to freshness of the work no tension is allowable on inner edge, (b) matured work permitting tension on inner edge. In the first condition, of no tension, the generally accepted theory is due to Prof. Crofton, of the Royal Military Academy, Woolwich, and is shown in Fig. 8. The base of the parallelogram of mean pressure and triangle of reactions, is set out three times the length of the distance from the resultant to the overturning edge; the depth of parallelogram is made equal to the mean pressure on the base supposing only that portion of the thickness effective, and the depth of triangle will be double the parallelogram. From this it results that the maximum pressure at outer edge will be

$$\frac{W}{3} \times 2 = \frac{2}{3} \times \frac{W}{d} \ldots\ldots\ldots\ldots\ldots\ldots (13)$$

Now the author finds some difficulty in accepting this theory, it appears to him reasonable that, as the base may be looked upon as a rigid body resting on a plane, the pressure might be divided in some way over the whole area, and he finds that Fig. 9 complies with all the theoretical tests he has been able to bring to bear upon it, and he offers this as an alternative to Prof. Crofton's theory. If it be the correct view it is important to give it due consideration, as the maximum pressure shown by it is greater than by the ordinary method. The maximum pressure K and the pressure directly under the resultant R, are given by the following formulæ:—

$$K = W\left(\frac{2}{d} - \frac{4}{t}\right) \ldots\ldots\ldots\ldots\ldots\ldots (14)$$

$$R = W\left(\frac{4d}{t^2}\right) \ldots\ldots\ldots\ldots\ldots\ldots (15)$$

In the second possible condition, of the work being sufficiently mature to permit the mortar to resist tension on the inner edge, the ordinary formula for combining a longitudinal and transverse load, or direct load and bending moment, may be adopted, viz.:

$$S = \frac{W}{A} \pm \frac{M}{Z} \ldots\ldots\ldots\ldots\ldots\ldots (16)$$

where S = stress in lbs. per sq. ft. at the edges, the + value being for compression side and − value for the tension side.

M = bending moment in pound-feet.

Z = modulus of section,* in foot units = $\frac{1}{6}\,t^2$ for 1 ft. run of wall, or $\frac{1}{6}\,b\,h^2$ for any other rectangular section.

This will give reactions as in Fig. 10, and it is worth noting that whether the resultant is pushed over to the given position by wind pressure, or is there by reason of a direct vertical non-axial load, the resulting stress is the same.

Or, for 1ft. run of a plain rectangular wall, the equation (16) may be conveniently given in the form

$$S = w\,h + \frac{3ph^2}{t^2} \ldots\ldots\ldots\ldots\ldots\ldots (17)$$

Or by transposition

$$\text{for compression } t = \sqrt{\frac{3ph^2}{S_c - wh}} \ldots\ldots\ldots\ldots (18)$$

$$\text{for tension } t = \sqrt{\frac{3ph^2}{S_t + wh}} \ldots\ldots\ldots\ldots (19)$$

---

*This section modulus Z is sometimes wrongly called moment of resistance, as for instance in catalogues of rolled joists where it appears as "moment of resistance in square inches."

(To be concluded.)

Trade and Craft.

Hopton Wood Stone.

"Some Geological Facts concerning Hopton Wood Stone," are given in a neat pamphlet that has been issued by the Hopton-Wood Stone Firms, Ltd., whose London office is at 134, Cheapside, E.C. The firm's offices and works are at Wirksworth, and their quarries are at Hopton, Middleton, Middle Peak, and Coal Hills, Derbyshire.

A very interesting account of the natural processes by which the stone has acquired its characteristic qualities and appearance is supplied by the Rev. E. C. Spicer, M.A., F.G.S., who is a University Extension lecturer on geology. A layer of igneous rock is interstratified with the limestone. "The limestone above this igneous band is unaltered. The limestone below it is altered in a remarkable degree. . . To understand this, it is necessary to remember that this igneous rock was produced by a flow of lava that was poured over the sea floor in the carboniferous limestone period, and lay in a heated and very slowly cooling mass upon the rocks below it. These underlying rocks would be strongly heated, and the heat downwards could only escape slowly through the underlying rocks which it would alter in the well-known metamorphic manner. The heat that escaped upwards would be carried away by the sea water, and the sea floor would be somewhat rapidly cooled; but as all lava is a bad conductor of heat the lower layers of the lava might remain in a red-hot condition for a very considerable period, and the underlying limestone would be strongly heated for an equally long time, would become thoroughly dried and baked, and the whole structure of the rock would be altered. Limestone under these circumstances would be turned into a marble, and the marmorisation would slowly die out downwards as the rocks became less and less strongly heated from above. This is what has actually taken place in the rocks in both east and west quarries, and it is extremely interesting to notice the gradual change in the character of the polished specimens taken from different broad bands of greater and greater depth." Much of the beauty of this marble depends upon the fact that the symmetrical remains of the "sea lilies" contained in it were not destroyed, but were crystallised in the process of baking, while the lime mud around them, and the cement that formed their matrix, was changed by the heat under pressure to a solid crystalline hardened paste, that is not only tough and exceedingly durable, but takes a most brilliant polish, while each layer presents its own pattern and its own coloration. Several plates show varieties of the stone; there is a folding view of the Middleton quarry, and there are many illustrations of important buildings in which Hopton-Wood stone has been used structurally and ornamentally.

Lifts and Cranes and Electric Installation

The firm of Messrs. Neville Kaye and Co., Ltd., 231-2, Strand, W.C., has been organised and registered to carry on an engineering business, and more particularly to specialise in electric, hydraulic, and hand-power lifts and cranes, and electric lighting and plant installations. Suitable works have been acquired in Sigdon Road, Hackney, N.E., and are being equipped with the latest modern machinery. Mr. H. Neville Kaye, the managing director, will be remembered as formerly the London manager to a well-known firm.

Mr. H. E. Tatham, who is no longer connected with E. Tatham and Co., Ltd., 25a, Holland Street, Kensington, is now acting as manager to F. B. Tatham, parquet, marble, mosaic, and tile merchant, of West Ealing.

The Sanatoria air bricks have been fixed outside the new council schools at Birkenhead. Many schools at present being built are adopting this ventilator.

Matters of Opinion.

No. 1 (continued).—The Increased Employment of Specialist Contractors.

We have received the following letter from the President of the Warrington and District Master Builders' Association:—

Dear Sir,—The members of this Association have been considerably interested in the correspondence appearing in your Journal on this subject, and at a meeting of the Committee held recently I was requested to write and emphasize the views put forward from the Liverpool Master Builders' Association in your issue of the 13th instant. Members of this Association can testify that under the present system the builder bears all the responsibility and often much expense in attendance on specialists, and in most cases received little or no remuneration.

It is certain the matter cannot proceed on the present unsatisfactory lines, and it is to be hoped that builders will soon make a stand and refuse to have anything to do with specialists unless the architect makes proper provision to remunerate the builder for his trouble.

Yours faithfully,
HENRY COLLINS,
President.

A strong desire to keep the Bradford Town Hall extension contracts in local hands is being manifested in the council and in the Press. Alderman Robinson has proposed that the work should be let to firms in the city, and he is supported by newspaper correspondents, who contend that while so large a percentage of craftsmen in the city are on the verge of destitution, it would be wise to give the contracts to local firms, even supposing this course involved increased expenditure.

Federation Notes.

THE YORKSHIRE FEDERATION OF BUILDING TRADE EMPLOYERS.

The monthly meeting of the executive council of the Yorkshire Federation was held at the Great Northern Hotel, Leeds, on Thursday, January 21st. Mr. W. R. Thompson (president), Mr. A. G. White, the National Secretary, and 43 delegates from the affiliated associations were present.

Minutes of last meeting were read and approved. Apology for absence was reported from Alderman W. H. Jessop, J.P., Huddersfield.

The procedure to be adopted at the general meetings of the National Federation in respect to the case of a Yorkshire contractor was considered. On the motion of Mr. J. Biggin, the president and representatives of the Federation were requested to mention this case to the Executive Council and annual general meeting, in order that the National Administrative Committee may be empowered to give financial support, in case they think fit, to sanction legal proceedings.

It was reported that the National Administrative Committee had accepted the invitation of the Yorkshire Federation for the Annual Conference of Secretaries to be held in Leeds in October next. On the motion of Mr. S. Coop, seconded by Mr. W. H. Holroyd, it was resolved to obtain 100 copies of the report of the Conference of Secretaries, held in October, 1908, for the use of Members of the Council.

The president reported that copies of forms of sub-contract agreements approved and issued by several Federations had been obtained and were receiving attention.

Attention was drawn to the fact that, although one or two local associations had been successful in obtaining the renewal of advertisements inserted in last year's directory, that instructions had not yet been received for the renewal in several other instances. Local associations were reminded that the financial success of the directory absolutely depended on their loyal co-operation and active support, and an earnest appeal was made for every effort to be made to secure the renewal of the existing advertisements, and to obtain additional ones.

Attention was drawn to Section 30 of the Housing, Town Planning, etc., Bill, an additional clause carried in committee in face of the strenuous opposition of the Government. The clause requires a quinquennial survey and register of all property under £26 in towns of 50,000 and upwards, and of £16 in towns under that population. On the motion of Mr. P. Rhodes, seconded by Mr. A. J. Forsdike, the National Administrative Committee were requested to urge upon the Employers' Parliamentary Council the great injustice which the clause might inflict upon owners of property, and to use every means in their power to obtain its omission from any draft Bill which may be introduced by the Government during the coming session.

Attention was drawn to the statement by the Prime Minister that he was in sympathy with the proposal to deal with the evils of sweating by way of a wages board. Mr. W. Irwin moved a resolution, which was seconded by Mr. W. H. Holroyd, that the Federation impress upon the National Federation and the Employers' Parliamentary Council the urgent necessity of ensuring that trades which are sufficiently organised shall be exempted from any legislation which may be introduced with the intention of ameliorating evils existing in trades not sufficiently organised.

The report of the committee appointed to consider the fair wages resolution of the House of Commons embodied in Government contracts was considered. Mr. White, the National secretary, stated that he was preparing a standard fair wages clause, embodying equitable conditions for the ratepayers, the contractor, and the operatives, which he hoped to submit to the National Federation at an early date.

The president stated that at the annual meeting of the Northern Centre the subscription of the three constituent Federations to the National Federation would be considered, and he asked whether the Federation had any instructions to give to their representatives. On the motion of Mr. P. Rhodes, seconded by Mr. A. W. Sinclair, the Federation representatives were empowered to concur in the payment of the National subscription for the current year on the commuted basis and in the existing proportions.

The annual report of the Council of the National Federation and the agenda for the national general meetings were considered.

A letter was read from the Sheffield Association with respect to the payment of walking time to operatives on jobs outside the area prescribed in the working rules. It was resolved, on the motion of Mr. A. J. Forsdike, seconded by Mr. W. T. Ledgard, to request the secretary of each local association to forward to the Federation secretary a copy of the working rules, and also particulars of any similar points which may have been raised, or other difficulties which have been experienced with respect to walking time.

Mr. W. H. Holroyd invited the Federation to hold the next meeting in Bradford. The invitation was accepted, and the date of the meeting fixed for February 18th, 1909.

The annual dinner was afterwards held in the Great Northern Hotel, Leeds, when 114 members and friends were present.—J. DAVIDSON, secretary.

The members of the Yorkshire Federation of Building Trade Employers dined together at the Great Northern Hotel, Leeds, on January 21st. About 120 gentlemen sat down. Mr. W. R. Thompson, of Dewsbury, president, occupied the chair, and among those present were the Lord Mayor of York (Alderman J. Birch), the Mayor of Dewsbury (Mr. F. W. Reuss), Mr. A. W. Sinclair, of Scarborough (a former president of the Federation); Mr. A. G. White, of London, secretary of the National Federation; Mr. J. W. White, of Sunderland, treasurer to the National Federation; Mr. W. G. England, of Barnsley (a vice-president of the Yorkshire Federation); and Mr. J. Davidson, of Leeds (the secretary).

Mr. A. W. Sinclair, in submitting the toast of "The National Federation," said it had provided an organisation which the trade had long needed, and by its means they had been able not only to approach the Royal Institute of British Architects, but municipal and other Councils, and even the Government of the day. More pleasing still was the work it had done in the matter of the operatives. The Federation had been able to cultivate relationships with the operatives by means of which reason had taken the place of the old methods of barbarism. If there was one work with which he was pleased more than another it was this scheme of conciliation. In the large branches of the trade it was not now possible to have a strike without the matters in question being referred to a conciliation or arbitration court. These boards were set up in every town where the employers and men were organised. By means of the National Federation also builders had been able to get from the Royal Institute of British Architects a just and equitable form of contract, which secured to the proprietor, to the architect, and to the builder fair and reasonable terms.

Mr. A. G. White, speaking in reply, said he knew of no county Federation which conducted its affairs in a better or more statesmanlike manner than the Yorkshire Federation. Glancing ahead, there were in his view two things which required serious attention. One of them was a National scheme of apprenticeship. From statistical information which had been obtained at headquarters, it was clear that in the building trade the members of the Federation were not making the required number of apprentices in any of the allied trades to make good the losses that arose from death, emigration, accident, and other causes. Builders would remember that the cause of the trouble with the plasterers a few years ago was really the scarcity of apprentices. The trade in France had lately been troubled with a shortage of skilled labour. The President of the Builders' Society of Paris had pointed out that neither the workman nor the masters cared to take the trouble to make apprentices. On account of the small sum of money paid to apprentices, parents preferred to send their children to employment that was more remunerative. They said the law was averse to them, that the specialisation of machinery was inimical to apprenticeship, and that employers themselves had abused the system by putting boys to all sorts of menial work not really connected with their trade. It was argued, moreover, that trade unionists had refused to instruct apprentices, and that there were no means of controlling recalcitrant apprentices. He (Mr. White) was afraid that if they examined matters they would have to admit that a good many of the conditions which applied to France would apply at home. He knew that his own experience lay in that direction. Quoting from the same French authority, he found that out of over half-a-million young persons employed in commerce and industry in France, only 19,000 received technical and theoretical instruction, 100,000 received some theoretical instruction, and 475,000 received no instruction of any kind. They were convinced in France that this matter would have to be seriously taken in hand, and he was of opinion that the question would have to be tackled here. Another problem which would have to receive attention was the abuse of the present compensation law. In France where a system similar to ours prevailed, the result had been extremely unsatisfactory, and the abuses had become so great that a stong movement was setting in in industrial quarters in favour of an amendment of the law. Abuses took the form of the simulation of injuries, and touting by medical men, with the object of getting as much as possible out of every accident. The result had been that in France there had been a great increase in the number of accidents reported—indeed, as much as 300 per cent. Medical and medicinal expenses per accident had doubled since 1901, and insurance rates had risen from 6 to 12 per cent. He (Mr. White) thought the Federation ought to get prepared. Of course, they could not do anything until they had a case, but by keeping statistical information of all the cases which arose—whether of malingering or of excessive medical or legal expenses—they might at the right time bring an overwhelming case for amendment before the Government.

Mr. J. W. White gave the toast of "The Yorkshire Federation."

The President, in acknowledgment, congratulated his fellow-members on the solid and compact position the Federation occupied. During the past year the Council had been occupied with the Home Office report on building accidents. Some of the clauses it contained would have been very much inimical to the building trade; they would have meant serious expense and increased cost in scaffolding, as well as aggravated the difficulties of carrying on the business by the stringency of the regulations proposed. He (Mr. Thompson) believed that the resolutions passed by the Yorkshire Federation had a great effect on Mr. Gladstone in dropping the proposed regulations during the past session. Another serious menace to the trade was the Works Departments which many municipal authorities proposed to set up, and there was no doubt that the pamphlet issued by their secretary (Mr. Davidson), setting forth the cost of these departments, had its effect at the elections which took place in November. He (the president) objected to the building trade being made the dumping ground for the unemployed. It meant an increased cost of from 50 to 100 per cent., and in some cases the employment of out-of-works had had the effect of displacing good men, who might otherwise have been employed.

Other toasts honoured included "The City and Trade of Leeds," "Architects and Surveyors," and "Guests and Visitors." The speeches were interspersed with agreeable selections of music.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Jan. 27. GRANGETOWN.—Works required (exclusive of joiner's and painter's) in additions, etc., to premises at Grangetown for the Middlesbrough Co-operative Society, Ltd. Persons desirous of tendering should send their names, etc., by Jan. 27, to Walter G. Roberts, architect, 61, Albert Road, Middlesbrough. Bills of quantities will be supplied.

No date. HAMMERSMITH.—Erection of a small concert-hall at Hammersmith. Plans supplied on deposit of one guinea. Persons desirous of tendering should apply to the architect, at Horncastle's, Cheapside, London, who will supply particulars.

No date. LLANDINAM.—Erection of a new vicarage at Llandinam for the Rev. James Jones, vicar. Plans, specification, and further particulars may be obtained on application to the architects, Deakin and Howard Jones, M.S.A., Plas Ynys, Borth, R.S.O.

No date. BIRSTAL. — Taking down Popeley House, Birstal, and the erection of outbuildings. Contractors willing to tender are requested to send their names to the architects, Joseph F. Walsh, F.S.I., and Graham Nicholas, F.R.I.B.A., Museum Chambers, Halifax.

No date. LEEDS.—Erection of two houses and alterations to premises, Hyde Park Road, Leeds. Contractors willing to tender for any of the separate works are requested to forward their names (stating trade) to Fred Mitchell, architect and surveyor, 9, Upper Fountaine Street, Albion Street, Leeds, and quantities will be supplied in due course.

No date. KELVEDON (Essex). — Execution of several alterations and additions to Prested Hall, near Kelvedon, for N. N. Sherwood. Plans and specifications may be seen at the office of J. W. Start, F.S.I., architect and surveyor, Colchester. Bills of quantities may be obtained on deposit of £2 2s.

No date. NEWPORT, SALOP.—Erection of students' hostel, at the Harper Adams Agricultural College, near Newport, Salop. Builders desirous of tendering are requested to apply to A. E. Lloyd Oswell, architect, Dana Chambers, Shrewsbury. Quantities will be supplied on deposit of one guinea.

No date. FORESTFACH.—Erection of new shops, bakery, and stables at Forestfach for the Cwmbwria Co-operative Society, Ltd. Builders desirous of tendering are requested to send their names immediately to C. S. Thomas, Meagher, and Jones, architects, 16, Wind Street, Swansea, from whom all particulars can be obtained. Fair wages clause.

No date. ANDOVER.—Erection of new premises in Bridge Street, Andover, consisting of shops, bakery, and stables, for the committee of the Andover Co-operative Society. Builders desirous of tendering are requested to send their names to the architect, R. Worcester, Co-operative Wholesale Society, Ltd., 1, Balloon Street, Manchester, with a cheque for one guinea as deposit for bills of quantity.

ENGINEERING.

Jan. 29. GLASGOW.—Construction of a steel footbridge across the river Kelvin, within the Botanic Gardens, for the corporation. Plans, sections, and detailed drawings may be seen, and specifications and forms of tender obtained, on application to the city engineer, City Chambers, 64, Cochrane Street. Sealed tenders, marked outside, "Tender for Steel Bridge, Botanic Gardens," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, by 10 a.m. on Jan. 29.

Feb. 1. MIDDLESBROUGH.—Construction of a footbridge over the railway at Cargo Fleet Road crossing, Middlesbrough, for the directors of the North-Eastern Railway. The work comprises about three tons of new steelwork, altering and erecting a pair of girders to be provided by the company, weight about 9 tons, masonry piers and timber steps. Plan and specification may be seen, and detailed quantities and form of tender obtained, on personal application at the office of W. J. Cudworth, the company's engineer, at York. Sealed tenders, marked "Tender for Footbridge at Cargo Fleet Road Crossing, Middlesbrough," must be sent by 9 a.m. on Feb. 1, to R. F. Dunnell, secretary, York.

Feb. 1. WILMINGTON.—Construction and erection of a footbridge over the Hull and Hornsea branch, near Wilmington, for the directors of the North-Eastern Railway. The work comprises about three-and-a-half tons of new steelwork, brick piers, and timber steps. Plan and specification may be seen, and detailed quantities and form of tender obtained, on personal application at the office of W. J. Cudworth, the company's engineer at York. Sealed tenders, marked "Tender for Footbridge over Hull and Hornsea Branch near Wilmington," must be sent by 9 a.m. on Feb. 1, to R. F. Dunnell, secretary, York.

Feb. 4. WOODFOOT, DUMFRIES.—Taking down the existing timber bridge over the river Annan, at Woodfoot, about two miles from Beattock Station, and supplying and erecting a new steel girder bridge of three spans, for the Lockerbie District Committee. Plans may be seen at the office of the engineers, Crouch and Hogg, C.E., 14, Blythswood Square, Glasgow, from whom copies of the specification, schedule of quantities, and form of tender may be obtained on payment of one guinea. Sealed tenders, marked "Woodfoot Bridge," must be lodged by 10 a.m. on Feb. 4, to John F. Cormack, district clerk, Lockerbie District Committee.

IRON AND STEEL.

Jan. 28. GALSTON (AYRSHIRE).—Supply and free delivery at Galston, Ayrshire, of 8-inch cast-iron pipes and special castings, for the Burgh. The contract comprises about 211 tons of pipes and specials. Copies of the specification and bills of quantities and form of tender can be obtained from the engineers, Elliott and Brown, Burton Buildings, Nottingham, on deposit of £1 1s. Sealed and endorsed offers to be delivered by first post on Jan. 28 to Robt. Blair, town clerk, Galston, Ayrshire.

Feb. 2. PENCISLEY (LLANDAFF).—Providing and laying about 1,300 yds. of 12in. cast-iron and 140 yds. of earthenware pipe sewers, with manholes, etc., at Pencisley, in the parish of Llandaff, for the Llandaff and Dinas Powis R.D.C., in accordance with plans and specification, to be seen and bills of quantities obtained on application to the engineer, James Holden, A.M.I.C.E., Park House, 20, Park Place, Cardiff. Tenders, sealed and endorsed, to be sent by noon, Feb. 2, to M. Warren, clerk, Park House, Cardiff. Sureties required.

Feb. 2. CARSHALTON (Surrey).—Supplying engineer's tools, workshop appliances and a single-phase electric motor at the children's infirmary, Carshalton, Surrey, for the Metropolitan Asylums Board, in accordance with conditions of contract and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer in-chief. Conditions of contract, specification, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon deposit of £1. Tenders, adressed as noted on the form, must be delivered at the office of the Board, by 10 a.m. on Feb. 2.

Feb. 4. MANCHESTER.—Iron and steel work required in the extension of an elevated railway siding at Gaythorn station, for the Corporation Gas Committee. General conditions of contract, specification, and bill of quantities can be obtained on application to C. Nickson, superintendent, gas department, town hall. Drawings can be seen and any other information obtained on application to the engineer, J. G. Newbigging, M.Inst.C.E., at Rochdale Road Station. Sealed tenders, addressed to the chairman of the gas committee, and endorsed "Tender for Elevated Railway Siding, Gaythorn Station," must be delivered at the gas offices, town hall, Manchester, by noon on Feb. 4.

PAINTING.

Feb. 2. Feb. 4. EDINBURGH.—Construction of a new 2 ft. by 3 ft. egg-shaped brick and concrete sewer for West Merchiston and Gorgie districts, 10 yds. or thereby, constructed in open cut and 314 yds. or thereby in tunnel, all conform to plans, specification, general conditions of contract, and schedule of measurement prepared by the burgh engineer, from whom schedules of measurement and all particulars may be obtained. Sealed offers, endorsed "Tender for W. Merchiston and Gorgie District Drainage," accompanied with priced schedule, must be lodged before 10 a.m. on Feb. 4, with Thomas Hunter, W.S., town clerk, City Chambers, Edinburgh.

ROADS AND CARTAGE.

Jan. 28. FULHAM.—Supply of 600 tons of Guernsey granite spalls (large) for early delivery, for the guardians of the poor. Tenders, upon printed forms to be obtained of E. J. Mott, clerk to the guardians, guardians' offices, 129, Fulham Palace Road, Hammersmith, W., or by forwarding a stamped addressed foolscap envelope, must be sent in by 10 a.m. on Jan. 28, sealed and endorsed "Tender for Granite."

Jan 30. CHINGFORD.—Supplying (1) broken Queenast, Leicester, or Guernsey granite, in trucks at Chingford station, as required; (2) supply and delivery of stone ballast and hoggin at per cube yard; (3) use of steam roller and scarifier, and the necessary labour in connection therewith, as required, at per day of 8½ working hours, for the U.D.C. Forms of tender may be had on application, and copies of the several contracts can be seen at the council offices during office hours. Contracts will be for the twelve months ending March 31, 1910, and all tenders must be sealed and delivered by noon on Jan. 30 to Leonard C. Bowen, clerk to the Council, 34, Station Road, Chingford, endorsed with the name of the article tendered for.

Feb. 1. DERBY.—Supplying broken granite basalt, limestone, slag, or other suitable materials required for the main roads, for the County Council, delivered at various railway stations and wharves in the county, during the year ending March 31, 1910. Form of tender and conditions of contract may be obtained at the surveyor's office, and will be forwarded through the post on receipt of a stamped addressed foolscap envelope. Tenders are to be delivered by Feb. 1, to J. W. Horton, A.M.I.C.E., county surveyor, county offices, St. Mary's Gate, Derby.

Feb. 1. YARDLEY.—Widening, making up, kerbing, channelling, and path paving various roads, for the R.D.C. Plans, specification, and conditions of contract may be seen and quantities and forms of tender obtained, on application to Arthur W. Smith, engineer, and surveyor to the Council, at the council house, Sparkhill, near Birmingham, between 10 and 1 and 3 and 5 (Saturdays 10 and 1), on deposit of three guineas to the clerk. Sealed tenders, addressed "The Yardley Rural District Council," and endorsed "Paving Scheme, 3," to be delivered by noon on Feb. 1, to Francis Ladbury Thompson, clerk of the council, Council House, Sparkhill. The contractor whenever possible must give preference to competent workmen as may be residents of Yardley. Fair wages clause.

Feb. 2. BRENTFORD.—Supply of 300 yds. of blue Guernsey granite, hand-broken to a gauge of 2 in., for the U.D.C. Forms of tender, together with specification and conditions, may be obtained on application to J. W. Croxford, surveyor, Clifden House, Boston Road, Brentford, between 10 a.m. and 5 p.m., week days, except Saturdays, and on Saturdays between 10 and 1. Tenders to be delivered to Step. Woodbridge, clerk, New Brentford, by noon on Feb. 2, marked "Tender for Granite."

Feb. 2. CHEAM.—Making up Frederick Road, Cheam, for the Epsom R.D.C. Plan and specification and form of contract may be seen at the office of the surveyor of highways, T. E. Ware, Waterloo Road, Epsom, where forms of tender and other particulars may be obtained. Tenders on the form issued by the council muct be received by Arthur R. Cotton, clerk, Waterloo Road, Epsom, by 7 p.m. on Feb. 2, endorsed "Tender for Frederick Road."

Feb. 2. HATFIELD.—Supply of broken granite and slag required for the main roads during the year ending March 31, 1910, for the Hertfordshire County Council. Forms of tender and condition of contract may be obtained on application to Urban A. Smith, M.I.C.E., county surveyor, county surveyor's office, Hatfield, or will be sent through the post upon receipt of a stamped addressed foolscap envelope. Tenders, upon forms provided, to be delivered by Feb. 2.

Feb. 2. TAUNTON.—Carrying out street improvement works in the following streets, for the corporation: Belvedere Road (West) and Clarence Street. Plans and specifications may be seen, and form of tenders obtained from D. Edwards, A.M.I.C.E., borough engineer, Municipal Buildings, Taunton. Tenders, endorsed "Street Improvement Works," are to be delivered under seal and addressed to the town clerk, Municipal Buildings, by 10 a.m. on Feb. 2.

Feb. 3. BARKING.—Execution of kerbing, channelling, flagging, etc., at Ripple Road within the district, for the U.D.C. Plans may be seen and specification, quantities, and form of tender obtained from C. F. Dawson, surveyor to the council, public offices, Barking. Tenders, endorsed "Tender for Ripple Road Paving," may be delivered to the highways and buildings committee at 7 p.m. on Feb. 3, or delivered to H. Hargreaves, clerk of the council, public offices, Barking, Essex, before the time mentioned. Surety required. Fair wages clause.

Feb. 4. ISLE OF ELY. — Supply of broken materials for the repair of main roads for the year ending March 31, 1910, for the C.C. Specifications and form of tender can be obtained upon the receipt of a stamped addressed foolscap envelope at the offices of H. Farr Simpson, county surveyor, northern division, Wisbech; R. S. W. Perkins, county surveyor, southern division, Ely. Tenders to be sent before 10 a.m. on Feb. 4.

Feb. 4. HOUNSLOW.—Execution of the following works:—(1) Making up Campo Road, Hounslow. (2) Making up Ailsa Avenue, St. Margaret's, for the Heston and Isleworth U.D.C. Plans, sections, and specification may be seen, and bills of quantities and form of tender obtained from J. G. Carey, engineer and surveyor, council house, Hounslow, on payment of £1 1s. Sealed tenders, on the form provided, must reach H. J. Baker, clerk, council house, Hounslow, by noon on Feb. 4, endorsed, as the case may be.

Feb. 6. CHELMSFORD. — Supply of Norway granite kerb and setts, for the year ending March 31, 1910, for the Essex County Council. Forms of tender and special envelope, and all other information and particulars, can be obtained at the chief surveyor's office. Tenders to be delivered by Feb. 6, to Percy J. Sheldon, M.Inst.C.E., chief surveyor, office of the chief surveyor, Chelmsford.

Feb. 8. GLANFORD, BRIGG.—Leading road material between April 1, 1909, and March 30, 1910, for the R.D.C. Forms of tender may be had on application to Frank C. Hett, clerk, to whom all tenders must be delivered by Feb. 8.

Feb. 8. HOLLAND (Lincolnshire).—Supplying about 15,288 tons of broken granite, 240 tons of granite chips, 1,450 tons of broken slag, 465 tons of coarse builders' sand, for the C.C., to be delivered at the different railway stations in the county. Conditions and forms of tender may be obtained of the clerk. Sealed tenders to be sent to H. Chaderton Johnson, clerk of the C.C., office of the clerk, Sessions House, Boston, marked "Tender for Granite, Slag, or Sand," by 10 a.m. on Feb. 8.

Feb. 9. POTTERSPURY.—Supply of granite (broken and unbroken), and slag for the year ending March 31, 1910, for the R.D.C. Forms of tender, with quantities required, and full particulars, may be obtained on application to James B. Fairchild, Potterspury, Stony Stratford, surveyor to the council. Tenders, marked "Tender for Materials," to be sent by Feb. 9, to W. R. Parrott, clerk to the council, High Street, Stony Stratford. Samples of stone to be delivered at the workhouse, Yardley Gobion, by Feb. 9.

Feb. 10. BRADFORD.—Supply of about 20,000 tons of road metal, required for the macadamised roads within the city, for the corporation. Form of tender may be obtained on application at the office of W. H. S. Dawson, city engineer and surveyor, town hall. Sealed tenders, endorsed "Tender for Road Metal," to be sent to Frederick Stevens, town clerk, town hall, Bradford, by Feb. 10. Fair wages clause.

Feb. 13. BATH.—Supply of granite and basalt in lump; also macadam and chippings, for the county main roads, to be delivered to the various stations, wharves, and sidings, during the financial year ending March 31, 1910, for the Somerset county council. Specifications, schedule of approximate quantities required at the various stations and wharves, and forms of tender can be obtained upon application to the county surveyor, Bath. Sealed tenders, endorsed "Tender for Road Material," and samples of the macadam to be delivered by Feb. 13, to H. T. Chapman, county surveyor, 1, Chapel Row, Queen Square, Bath.

Feb. 17. GLOUCESTERSHIRE.—Supply of stone for use on main roads for the year beginning April 1, 1909, and ending March 31, 1910, for the County Council. Forms of tender can be obtained from the county surveyor. Tenders must be delivered by Feb. 17th, marked outside "Tenders for Material," to E. S. Sinnott, M.Inst.C.E., county surveyor, Shire Hall, Gloucester.

Feb. 22. LITTLE HULTON, near Bolton. — Supplying broken granite, grit setts, granite and limestone chippings, grit kerbs, artificial and natural flags, stoneware pipes and gullies, cement, steam road rolling and scarifying, disinfectants, pitch and oil, for the U.D.C. Forms of tenders and particulars can be obtained from James H. Heyes, clerk, council offices, Little Hulton, near Bolton, any day between 9 a.m. and 5 p.m. Tenders, sealed and endorsed "Tender for ——," to be delivered at the council offices by 4 p.m. on Feb. 22.

March 2 MERIONETH.—Maintenance and repair of the rural main roads of the county, for the C.C. Particulars, specifications, bills of quantities, etc., may be obtained on application to E. Vaughton, county surveyor, Arthog, Dolgelley. The county is divided into 4 districts, and intending competitors may tender for any or all. As it has not been definitely decided whether the contract will be let for a period of 1, 3, or 5 years, tenders must be sent to cover each of those periods. Tenders to be delivered to David Breese, clerk to the council, Portmadoc, by 10 a.m. on March 2.

MISCELLANEOUS.

Jan. 28. GRAYS THURROCK.—Supply and delivery of 435 yds., or thereabouts, of stoneware pipes, and 500 lin. yds. or thereabouts of concrete pipes, for the U.D.C. Full particulars of the sizes required, together with specification and forms of tender may be obtained on application to the council's surveyor. Tenders, endorsed "Tender for Stoneware (or Concrete) Pipes," as the case may be, to be deposited by noon on Jan. 28, with Hatten and Asplin, clerks to the council, Urban District Council Offices, Grays.

Jan. 29. EXETER.—Supply of building materials to the Devon County Asylum for the half-year ending June 30, 1909. Forms of tender to be obtained of E. H. Harbottle, F.R.I.B.A., County Chambers, Exeter, to be signed, sealed, and delivered to the clerk of the asylum by Jan. 29, endorsed on the outside "Tender for Building Materials."

Jan. 29. LONDON, S.W. — Removing plaster from the ceilings of the men's and women's swimming baths in Manor Street, and substituting therefor 7-8 in. yellow deal or pitchpine matchboarding, for the Chelsea B.C., in accordance with specification, which may be seen at the office of T. Holland, town clerk, town hall, King's Road, Chelsea, S.W., between 10 and 5 daily (Saturdays 10 and 1). Persons tendering must state separately in their tenders the difference in the cost of the work if carried out in pitch-pine instead of yellow deal. Tenders to be delivered in sealed envelopes, endorsed "Tender for Repairs, Public Baths," at the town clerk's office, by noon on Jan. 29.

Feb. 1. RICHMOND, SURREY.—Supplying about 1,000 yards of stoneware pipes, 15 inches and 18 inches in diameter respectively, fitted with Hassell's double-lined safety joint, for the Corporation. Conditions of contract may be inspected, and a copy of the specification and form of tender obtained on application to J. H. Brierley, borough surveyor, town hall, Richmond, Surrey. Sealed tenders, properly endorsed, to be delivered by 4 p.m. on Feb. 1, to Henry Sagar, town clerk, town hall, Richmond, Surrey.

No date. HURWORTH-ON-TEES.—Pulling down and rebuilding the Emerson Inn, Hurworth-on-Tees, for the proprietor of the City Brewery, Durham. Contractors desirous of tendering must send names and addresses, together with the trade or trades they require, to W. T. Aggutter, architect, Horse Market, Darlington, who will supply bills of quantities and other information.

Visionary London.

If, and when the Towns Planning Bill comes into operation, London can be immediately "laid out." it will only be necessary to appoint assessors to pronounce upon the scores of schemes that have been already committed to paper—or cloth. Mr. C. Lewis Hind, writing in the "Daily Chronicle" the other day, describes how, with the object of discussing the beautification of London, he met at a restaurant a gentleman who, "being an artist as well as an architect" (but surely these things are one), neglected his devilled kidneys, pushed his plate aside, and drew "spidery pictographs" on the table-cloth, showing how he would improve Battersea Park and Trafalgar Square. "See," said the artist, "here is the open river promenade along the water front. You arrive by boat; you enter the gardens from the long flight of water steps in the centre; you approach a great area with a bandstand on the axial line of the grand avenue; you find concert-halls, picture galleries, winter gardens, covered loggias, tennis lawns, a stadium for sports, a lake—in fact, a permanent pleasure garden for London." Incidentally you find the money for these things; but that is a mundane consideration that the artist-architect seems to have swept aside with the devilled kidneys, which, on a table-cloth, ought to have appealed to him as a well-conceived design for an interior. But Battersea Park thus glorified is a delightful vision; and whether or not, or how soon or how late, it is realised, depends on the rate at which the art education of the public may proceed, and the height and depth and breadth to which it may ultimately extend. Trafalgar Square is to become the finest feature of the first city of the Empire—the architectural commemoration of our sea-power. If, and how soon, this dream is to be realised depends very largely—does it not?—on the influence of our sea-power in preserving the peace of the world, and of thus conserving for expenditure upon the arts of peace a modest modicum of the nation's wealth. Mr. Hind, by the way, evidently loves London—or some of it—as it is, whether or not he indulges in visions of what it might be; and he very rightly contends that "for better or worse, we cannot dissociate architecture from London's strange and ever-changing atmospheric conditions. His admiration for the Nelson Column may perhaps be forgiven in consideration of his rather poetic rhapsody over Somerset House. This, he says, "is the exterior of my choice, seen from the Thames at twilight, detail gone, solemn as a prayer, barely a century and a quarter old, the dignity and reserve of the building growing every year lonelier and more detached from its assertive modern companions. When Sir William Chambers raised the prison-like palace, did he think that in the year 1909 we should prize it as one of the supreme architectural relics of elder London?" Certainly it is a fine piece of masonry; and some very competent sculptors—Carlini, Wilton, Geracci, Nollekens, Banks, Bacon, and Flaxman—assisted in its decoration. Elmes thought that the style was "refined to a degree scarcely excelled by Palladio himself; and Chambers was careful to go to Rome for models for his Ionic, Composite, and Corinthian capitals. It must not be overlooked by students, however, that there are parts of the building for which Chambers is not to be held responsible. The west wing facing Wellington Street was finished by Pennethorne; and the north end was not finished until 1853, Chambers having died in 1796. It was in the old Somerset House that Inigo Jones, in 1653, breathed his last. But the popular attitude towards art and beauty is subtly suggested by the last sentences of Mr. Hind's interesting article: "As we rose, the waiter swept the cloth from the table—a little hastily, I thought."

———

Housing the Londoner.

The report on housing recently issued by Mr. E. Harper, the statistical officer to the London County Council, confirms certain popular impressions with respect to the development of London, and others it corrects. The tendency of the population to forsake the centre and radiate towards the suburbs is, of course, well marked and indisputable. Cheap and plentiful means of transit enable the merchant and the workman to avail themselves of the cheaper rents and purer atmosphere of the suburbs; and, indeed, the cheaper rents and lower rates prevailing beyond the boundaries of Greater London have induced many comparatively well-to-do persons to go much farther afield than the suburbs, so that thousands of prosperous city gentlemen find it pleasant and convenient to live from twenty to fifty miles out—preferably near good golf links. This movement is no doubt largely responsible for the rise and extension of the excellent school of domestic architecture that, while insufficiently appreciated at home, is greatly admired by our friends abroad, who envy the English architect his opportunities, and congratulate him on the admirable use he has made of them. With regard to working-class dwellings, Mr. Harper corrects the exaggerated notion commonly entertained that in this direction private enterprise has been almost completely paralysed by municipal action. He states that, as a matter of fact, during the past six years private enterprise has provided ninety-three per cent. of the accommodation. The present position of the Council in this matter is thus summed up in the report: "If by any means the provision of houses by private enterprise can be further stimulated, the scope of municipal house building might then without danger be limited to (a) The building of dwellings which should serve as models to private enterprise; and (b) The provision of accommodation for any particular class or locality which appeared to be neglected by private enterprise." Building owners and speculative builders may still maintain the ultramontane theory that a municipality has no moral right to interfere at all; but, since the Works Department has been abolished, the non-speculative builder will not feel greatly disposed to quarrel with the reasonable attitude and the comparatively modest tone that the present Council has seen fit to adopt.

———

Feasts of Reason.

The value of that immemorial and immortal institution, the after-dinner speech, is greatly underrated. It is too often the subject of "fleers and jibes and notable scorns." Unctuous the eloquence may usually be, but this particular quality should only serve to make more plausible the saying of Dr. Johnson, that "a dinner lubricates business." The speaker becomes more expansive and candid, the hearer more receptive and tolerant. It may therefore be regarded as fortunate that of all men, architects and builders seem most addicted to the dinner habit, perhaps because they are more clubbable or gregarious than other men, but more probably because they form an exceedingly large section of the community, and because, since in the nature of things, their sayings and doings are always of public interest, the press gives greater publicity to the speeches delivered at their formal dinners. The winter being—in spite of certain sceptical denials—the slackest season for the builder, formal dinners are at present very prevalent, and, on the whole, they are proving very prolific of wise and effective utterance, the inevitable "dreary commonplace observations" being but as the sand to the mortar. At builders' dinners we have had, lately, some quite statesmanlike pronouncements on such matters of pith and moment as municipal trading, the decay of apprenticeship, the fair wages clause, the drafting of public contracts. At these symposiums architects are always present, and nearly always contribute something material to "the feast of reason." At their own dinners they are rather more given to "the flow of soul." It is there that we are treated to really coruscating little essays in æsthetics and in professional ethics. Take as a recent and quite an average example the speeches at the annual dinner of the Leeds and Yorkshire Architectural Society, which was held at the Queen's Hotel, Leeds, on January 28th. Mr. E. Kitson Clark, president of the Leeds Philosophical Society, in proposing the toast of "The Royal Institute of British Architects," said, with as much felicity as truth, that "the architect turned simple handicrafts into arts, and conferred upon the world the greatest pleasure, the greatest inspiration and the greatest delights of sacred memories." After this flight into the empyrean, Mr. Clark seems to have felt that he had qualified for censorship of the smoke nuisance! Mr. Paul Ogden, F.R.I.B.A., president of the Manchester Society of Architects, who was among the guests, urged the importance of giving the architect a better education and a higher status. The universities throughout the United Kingdom, he said, were going "to tackle architecture as he believed it ought to have been tackled by the R.I.B.A." He has faith in the power of the universities to place the architect on a level with the medical and legal professions. That may very well be. The universities can equip the architect with scholarship; but what about art? Is it communicable by any method known and approved at the universities? We are not at all combating Mr. Ogden's contention, but are simply venturing to suggest that architects should be very careful to steel themselves against the mere glamour of a university career. We do not object to their capturing the universities; but they will have to see to it that the universities do not capture them. To put the matter very frankly, it seems to us that the university curriculum in architecture may be easily more academical than practical. At all events, the majority of architects, debarred by circumstances from studying at a university, would be sure to console themselves with this belief. They would derive some comfort, too, from this remark by one of the speakers who followed Mr. Ogden: "We had instances of architects animated by the highest conception of art, but we did seem to lack—it was the fault of the spirit of the age—those higher ideals which had produced in the past buildings to which we looked back with reverence that was all the greater when we recollected that architecture was not taught then in that perfect manner in which they hoped it would be taught in the Leeds University." This is to say, that the old architects did very well without academical training. And this gentleman's phrase, "looked back with reverence," is perhaps more significant than he intended it to be. Future generations will no doubt "look back with reverence" on some of the slighted buildings of to-day, and commend our "higher ideals." But these professional and trade dinners certainly present us with abundant food for thought. We are glad that they are so numerous, and we are sorry that most of them seem to be held "up North." Why is the South less gustatory?

THE EDUCATION OF THE ARCHITECT.

We believe we are justified in stating that a considerable portion of the community is gradually realising the fact that unless some immediate effort is made to institute a thoroughly efficient scheme of architectural education in this country, much of the work of the future, which should (and undoubtedly would in more favourable circumstances) be placed in the hands of English architects, will fall into those of their better trained and more highly educated confreres of other nations. There can be no doubt, if our national architecture is to ultimately attain any considerable measure of artistic success, that the present-day unscholarly methods of design will have to be altogether abandoned, and recourse, once again, be had to the close study of the many magnificent structures in Greece and Italy under the influence of which Inigo Jones, Wren, Gibbs, Chambers, and other artists of the 17th and 18th centuries produced their great and lasting works. To re-establish that national tradition, in all its real and scholarly significance, should be the aim of every architect who has the welfare of his profession at heart. The old-time system, whereby the student entered an architect's office for a term of pupilage of from three to five years, is rapidly becoming obsolete and, unfortunately, the various architectural schools which are springing up throughout the kingdom may not form efficient substitutes. In the former method of acquiring the requisite knowledge of his profession, the student is generally left far too much to his own devices, and, in his principal's absence, the amount of tuition he receives is, sometimes, altogether dependent upon the good will, or leisure, of the senior member of the office staff. Our main objection to the latter system of education (i.e., that embodied in the course of training afforded to the now numerous students of the architectural schools) is due to the fact that the studies are not necessarily directed nor personally controlled by men of great practical experience in architectural work. What is required is a system of training, modelled on that of the *Ecole des Beaux-Arts*, which combines the best elements of the two methods of training to which we have referred—so organised that, from its commencement to its close, the students' education is under the personal control of an architect who has long been engaged in the active exercise of his profession.

THE BOARD OF PROFESSIONAL DEFENCE.

The onerous duties of the Board of Professional Defence are carried out in a manner so passing strange and unostentatious that we have often felt inclined to doubt whether even the *existence* of this extremely valuable organisation of architectural "stalwarts" is known to the majority of our readers. Whilst we are not desirous of destroying, by dragging into the full glare of publicity, the tranquil environment hitherto enjoyed by the self-contained members of an unscrutable board, yet as the most passive of passive resisters often, inadvertently, commits many sins (of omission), we are bound to take such salutary measures as are in our power by calling attention to a recent case in which the long-suspected shortcomings of the Board of Professional Defence have at length, in our judgment, been made manifest. A letter we have received from an old and highly-respected member of the Royal Institute of British Architects with regard to the conduct of this Board seems to require a very full and explicit answer, and we await it with a considerable amount of interest. Briefly, the facts of the case are as follows: —Some three years ago our correspondent was asked by a client to look out for an old house, situated in one of the most fashionable parts of London, which could be altered and adapted to suit modern requirements. A considerable amount of time was expended in this preliminary search, during which the architect visited and inspected several house, and wrote numerous letters and reports respecting their suitability, but nothing further was done until about a year later, when a house was at length selected, which our correspondent was instructed to alter and embellish. The alterations themselves were of a quite unimportant nature, and merely involved the removal of some partitions, blocking up a window in one of the rooms, and substituting a domed top light. The decorations, however, were designed on an elaborate scale, and various schemes for colour and plaster treatment were prepared, and after one (of several designs made in sketch form) had been chosen for execution, the whole of the requisite full-size drawings and cartoons were completed, and great personal attention was given by the architect to the supervision of all modelled and other executed work. An enormous amount of time, quite out of proportion to the outlay (about £1,500) was thus expended, and, in addition to the work involved in connection with the design actually carried out, many schemes were made, and ultimately abandoned, for other decorative works, including alternative drawings for an elaborate staircase—(1) in bronze, (2) in wood, and (3) in iron, for which full-size details were made, and estimates obtained. For the work thus set aside, a charge of £6 6s. a day was made for the architect's time (to which was added the amount paid to his staff for assistance) and for the surveys and reports on the old properties (including interviews, letters, etc.), the charge was at the rate of £3 3s. per day. Our correspondent's client refused to pay *any* of the charges beyond those he described as "recognised" architect's fees of 5 per cent. upon the amount of the work actually executed. He further declined to admit his liability to pay anything for the time expended in preliminary inspections and negotiations with regard to the old properties, refused to pay any charge for preparing duplicate plans, for the approval and deposit with the freeholders, nor would he make any payment for the working and other drawings which were prepared by his instructions but never executed. Owing to the fact that our correspondent could obtain no support from the Board of Professional Defence, he was forced into the alternative of either having to accept the amount ultimately offered by his client in full settlement (which was less than one-third of what was justly due) or to face what would inevitably prove a long delayed law-suit, in which the costs of the action would more than absorb any sum that might be awarded to him even if it covered the full measure of his claim. Our correspondent was also advised that, owing to the ridiculous manner in which the scale of charges authorised by the R.I.B.A. has been drafted, it was very doubtful whether he could substantiate his claim for more than 5 per cent. on the amount expended (although he offered to accept 7 per cent.), and that, as the Institute would not officially support his case, there was little or no hope of ultimate success. Had it been possible to obtain evidence from the R.I.B.A. that the charges were just and fair ones, the claim could never have been repudiated, as the facts were indisputable. Finally, our correspondent found he could not do otherwise than accept the sum paid into Court by his client, which was barely sufficient to cover his out-of-pocket and working expenses. The letter concludes with the following expression of opinion, with which we heartily concur:—

"I do think something ought to be done to raise a feeling against the shocking want of *esprit de corps* at the R.I.B.A., which allows its members to suffer in this fashion without even making an effort to help."

[illegible]

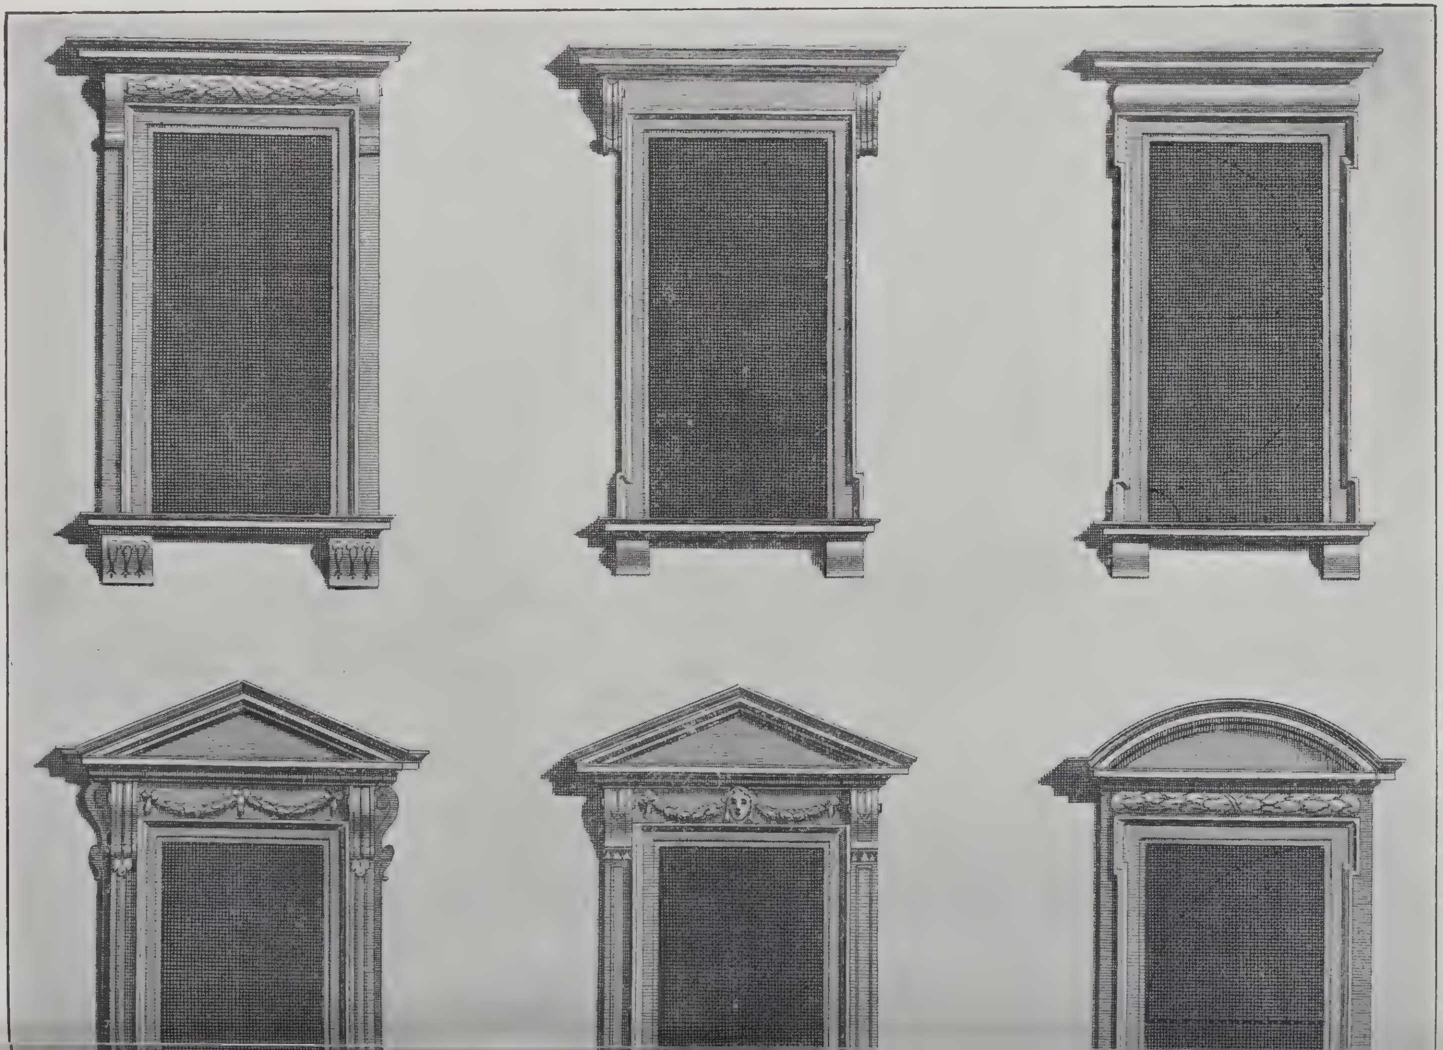
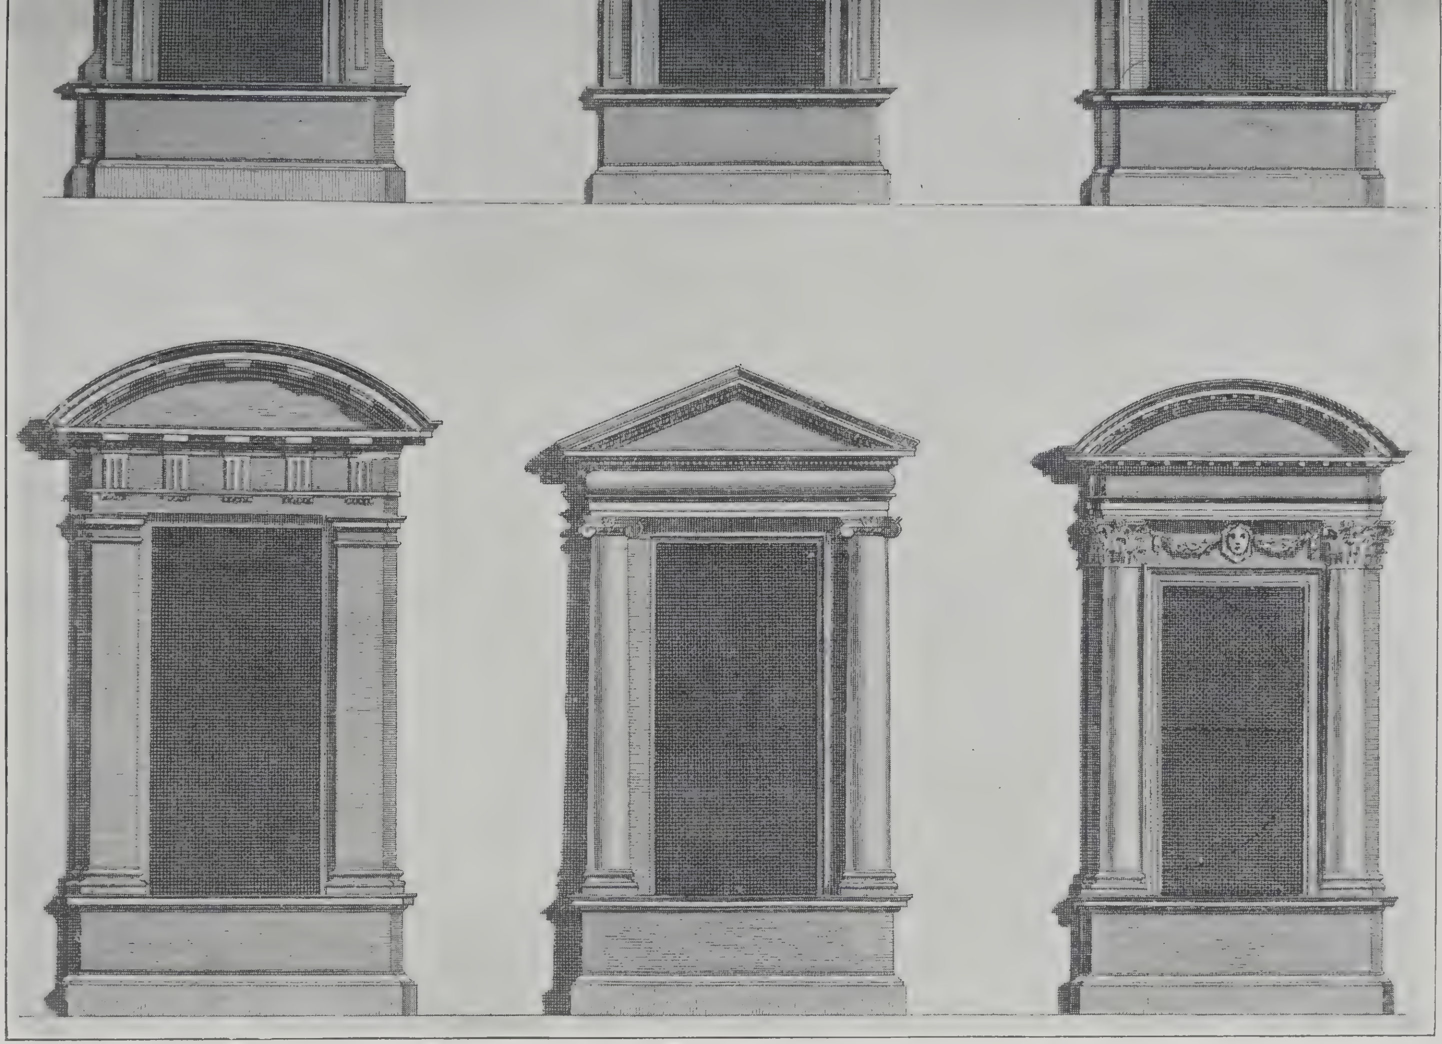
UNIVERSITY OF ILLINOIS

Supplement to THE BUILDERS' JOURNAL AND ARCHITECTURAL ENGINEER. ***Wednesday***, *February 3rd, 1909.*





SOME DESIGNS FOR WINDOWS. BY JAMES GIBBS.

PLANNING THE HAGUE PEACE PALACE GARDENS.

By T. H. Mawson, Hon. A.R.I.B.A., author of the first premiated design in the International Competition.

At a meeting of the Liverpool Architectural Society, Mr. T. H. Mawson, Hon. A.R.I.B.A., of Windermere, the winner of the International competition for gardens to the Hague Palace of Peace, delivered an interesting lecture on the subject.

The garden designer who has to fit in his garden with houses where there is no clearly defined style as a basis to start upon, and is anxious to secure some degree of harmony between the house and the garden is, said Mr. Mawson, constantly putting to himself the problem: What would the architect have done if he had planned the whole scheme himself? The designer of the Palace of Peace was almost wholly free from city restrictions, and was thus open to concentrate upon monumentalising a palace to express and enshrine the noble ideal of universal peace. The period chosen as *motif* by the successful architect is that which is peculiar to the fighting barons of Normandy, and is occasionally seen on the Rhine, and perhaps more frequently in Scotland, whither it was imported when she was coquetting with France. Whether the *motif* is a right one or wrong, M. Cordonnier will, in the author's opinion, succeed in erecting a more dignified presentment than we usually see around us. From the conditions given to the competitors in the garden-planning scheme, the author gathered that the trustees of the Carnegie foundation desired a scheme which would fittingly correspond with the amplitude and magnificence of the Palace, and that they looked to each competitor to unite fittingly the Palace with the natural beauty of the park on a similar bounteous and monumental scale, and at the same time bring palace and park into a proper topographical relation to the town.

As to the landscape, almost all visitors to this part of the Continent know the superb Scheveningen Avenue, which forms a boundary to the present Buiterust Palace. To those who do not know it, it will be sufficient to say that the influence and sentiment of this part of the Hague retains the atmosphere of the celebrated Dutch landscape painters. The site is at once reminiscent of Hobbema's umbrageous avenues, and Jan Steen's quaint architecture.

As to the peopling of the Palace Garden, and the uses it is to fulfil, the author concluded that although the public will not be freely admitted as into a public park, yet there will be in addition to the plenipotentiaries, in residence or attendance during the peace conference meetings, a large number of secretaries, and so forth, all of whom would have free use of the gardens. He concluded, also, that during the long vacations, permission would be given to visitors (subject to certain regulations) to view the gardens. Therefore provision has been made for walks and terraces largely in excess of what is needed in private parks and grounds.

The ethical aspect of the question to be solved demands that the prior impression upon the spectator should be that of spaciousness and restfulness. The very word peace leads the mind to something spacious and wide-spreading, and implies quiet stretches, open effects, and secluded avenues for meditation and tranquility. Therefore, in evolving his design, the author distinctively sought to realise a garden that bespeaks peace and rest—by breadth of treatment, and by noble, happy, and dignified features and adornments, avoiding a multiplicity of such, for fear of destroying breadth and scale. He has further sought to suggest, by beautiful sculpture and restrained and chaste modulation of ornament, the arts of peace, and to pronounce the restful note by clear, tranquil pools of water; and by a careful selection and disposition of trees and shrubs, ensuring scale of leafage and promoting the same harmoniousness throughout, and avoiding all prickly exotics and violent schemes of colouring or over-bold contrasts which do not conduce to this pleasure.

To realise this expression of peace and tranquility by a dignified presentment to the mind and eye, it is first necessary to form a broad-spreading basis to the palace itself. This could only be done by distinctive spreading masses of masonry and level spaces of greensward, gravel, or pavement, repeating in the terraces and other architectural features the monumental stone treatment adopted by the architects in the lower portion of their design.

From a careful study of the design for the Peace Palace, it seemed to the author that the architects have themselves put forth some slight suggestions in the directions he had followed in his designs. He had the further object in mind of carrying the atmosphere of the Peace Palace into the remotest portion of the grounds.

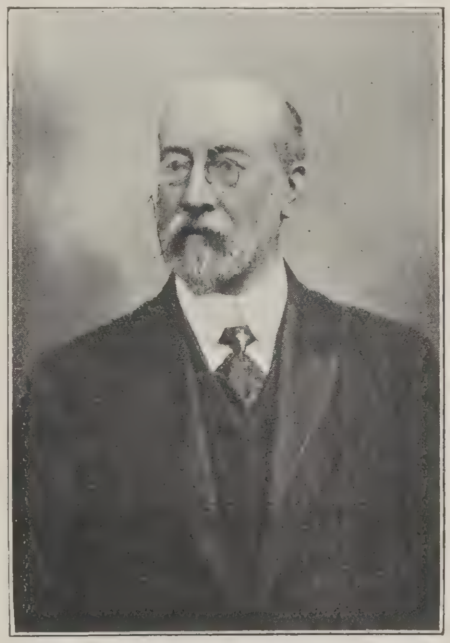


Photo: Russell.

MR. JOHN BELCHER, R.A.

Mr. Belcher, the well-known architect, attained Academician rank last week in company with Mr. Goscombe John, the sculptor.

It was of equal importance to secure a proper relationship between this most important building, and the town. The scale of the Peace Palace is such as to render in all probability a permanent dominating note in the composition of this part of the Hague. It had therefore appeared to him that the palace and park should not only be suitably received into what is without harshness or discord, but that they should contribute to the further improvement of the "city beautiful," welding into picturesque compositions the new and the old.

At the conclusion of the lecture, which was accompanied by lantern slides of the winning design, and also of the second premiated design, which was submitted by a Dutch firm, a hearty vote of thanks was accorded to Mr. Mawson

Our Plate.

The nine designs for windows by James Gibbs show considerable "diversity in unity." They are all unmistakably by the same hand, and yet there is remarkable variety in the detail. The designs are, without exception, suave, dignified, and restrained, and show complete mastery of the resources at command, and much ingenuity in adapting them to the somewhat exacting circumstances.

R.I.B.A.

CRITICISM OF WORK SUBMITTED FOR THE INSTITUTE PRIZES AND STUDENTSHIPS 1908-9.*

By Paul Waterhouse, M.A.Oxon (F.).

The Essay Medal.

The three selected for mention are happily better than the average production of recent years. This prize should undoubtedly attract a better class of writing than we generally secure; our literary level is nowhere near the standard attained among our draughtsmen. "Void's" work (Mr. H. A. Hill, B.A.) is a sensible essay, not very brilliant, perhaps, nor very clever in its conclusions, but the thread of thought is clear and the style free from blemishes. He beats his rivals by a not too wide margin. "Vita Nuova" (Mr. Horace Cubitt) has lapses of style, but his matter is in some ways more interesting than that of "Void." "New Lamps for Old" (Mr. Ross) submits a bright and readable paper, and he avoids the fault of producing a mere compilation, and his work is at least a continuous composition. "Modus operandi" and "X. Y. Z." come, in my opinion, in the second class: the former writes cleverly but too slightly; he has some original points, but rather shirks the larger issues; the latter, on the contrary, is too prolix, and, in the language of the golf-links, is "poor in his approach." It is a great thing to get on to the green and to do it neatly; also, of course, one should if possible "hole out." Of the remaining four I have no wish to make particular criticisms by name. I will merely say to one of them, "Be graceful as well as industrious"; to another, "Write a continuous essay, not a series of chapters"; to a third, "Please don't be vulgar"; and to the last, "Develop." To all I might commend one very simple truth—that the only recipe for writing is reading.

Measured Drawings.

In this competition there are two competitors who press the winner hard. Mr. Ernest Wray ("San Gallo") is the medallist, and his survey of the Church of the Madonna di San Biagio at Montepulciano is a well-drawn and complete record of an interesting bit of work. Mr. Alan Brace, who wins a second prize (as "Flint") with a study of Lavenham Church, has turned out a very beautiful piece of pencil work; his handling is nearly perfect, and I am impelled to conclude that if his delineation had been more complete he would have won the prize. The absence of a longitudinal section deprives us of any record of the nave arcade.

The Soane Medallion.

That Casino was an excellent subject for the Soane Medallion. It has set men thinking not merely of the old truth that an architectural design must express the spirit of the building it clothes, but also of the question (always an important question) how far that expression must be explicit, how far literal, and to what extent curbed. For "Conchitic" I feel sympathy and disappointment. More than any rival he has been faithful to the spirit or to a possible spirit of the subject, but he suffers for his realism. He should have tempered truth with dignity. In other words, by his very realism he falls short of architecture, and that is why he cannot have an architectural prize. His plan is fairly good, his elevations are mischievously clever, and his perspective as a composition and as a bit of quiet colouring is excellent. But—if I may put it as clearly as I can—his Casino, if conducted on the lines of his design, would deserve to be closed. Mr. Anthony Barker has caught the breeze of frivolity without relapsing either into buffoonery or vice. "Centrelines," a scheme by Mr. A. Berrington, is another design overflowing with that buoyancy which characterises the products of a good Soane year. Probably it was time rather than any lack of impetus which cut short the completion of the perspective. What there is of it shows a happy knack of draughtsmanship, and the power to infuse a drawing with the spirit of the designer. It is full of an irresistible gaiety. The elevations and sections are cleverly drawn in a rather unusual style. The plan is fair, but there seems to be no provision for a stage in the concert room.

---

*Extracts from a paper read at the general meeting of the Royal Institute of British Architects, February 1st, 1909.

The Owen Jones Studentship.

Unhappily this important prize has to be withheld. But Mr. Maw, the sole competitor, who is awarded twenty guineas, has sent in some interesting work. His subjects are the Corsini chapel in San Giovanni in Laterano, and the ceiling of the Scale d'Oro at Venice. The studies of the latter are laborious and effective. The amount of work put in the pictorial panels and their rich marginal frames is astonishing. I take off my hat to his industry.

The Pugin Studentship.

There is a full competition for this interesting prize, and a very high level is reached. The winner, Mr. S. H. Miller, has mastered the enviable trick of drawing a perspective sketch in such a way as to give real information in detail. He is happy both with ink and pencil, and in a study of some Fairford glass shows that he can hold his own with colour, too. Mr. Fraser has done good work at Southwold, and, like the winner, shows himself to be capable in more than one medium. Mr. Gill is to be commended, not merely for excellent draughtsmanship, but for some really good printing and writing, especially on his Chichester sheets.

The Tite Prize.

The Tite Prize competition is generally more sober than that for the Soane; the great names quoted in the conditions as exemplars perhaps account for this result.

A few words about the three winning designs by Messrs. Gunn, Maw, and Lisle. They are all three excellent workmen, and have turned out quite first-class work. Mr. Gunn's perspective is a marvellously delicate piece of pencil work; it is, in fact, too delicate for effect. Mr. Maw ("Dezzezero") submits a set which for pure beauty of execution runs the winner very close. His delineation of statuary and of colour decoration is most beautiful. Perhaps his general scheme errs on the side of sacrificing too much to effect. Mr. Lisle will not quarrel with me if I describe his work as peaceful. It is one of the best attributes one can apply to architecture, and he has succeeded in keeping out of his design and its execution anything that could possibly ruffle its calm.

The Arthur Cates Prize.

Mr. Leslie Wilkinson, to whom the distinction goes this year, is well deserving of the honour. His interesting studies range from St. James', Piccadilly, to St. Mark's at Venice, and include two excellent Oxford drawings—one a difficult sketch of the Radcliffe Library, and another of Inigo Jones' Court at St. John's College.

The Grissell Prize.

"Dies" (Mr. Douglas William Day), to whom the prize has been awarded, has very properly had an eye to royal effect as well as to structural stability. He has in his roof adopted the double-dome construction, and has worked out the stresses and weights with commendable care. Every portion of the jointing of the masonry is most clearly shown, and he has been at pains to make a real study of the problem. His design is simple and pleasing—none the less pleasing for being simple. A building of this kind is meant to give its effect at some distance across the water, and the designer has evidently borne this in mind. But I am not sure about his wilderness of colonnades. He has filled the sheet with them.

It was announced at the meeting of the Royal Institute of British Architects on Monday night, that Dr. Arthur J. Evans had been nominated to receive the Royal Gold Medal.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Feb. 20	GUILDFORD. Footbridge over the River Wey. Designs are invited for a light footbridge in oak or other materials. Particulars from C. G. Mason, C.E., Tuns Gate, Guildford. Designs to be sent to W. Shawcross, Hon. Sec., 108, High Street, Guildford.
Feb. 20.	PENCLAWDD (WALES). Chapel. Plans are invited for a new chapel to contain 800 seatings. Approximate cost of chapel, including heating and acetylene lighting apparatus, £3,000. Premium—five guineas to the architect whose plan *the Committee may select.* Plans to be deposited with John Rees, Secretary, Penian, Penclawdd, S.O.
Mar. 1.	TORRINGTON (DEVON) Memorial Cross. The Committee of the Rolle Memorial invite designs for a memorial cross (preferably of granite), to be erected in the churchyard, Torrington. Cost, inclusive of erection. &c., not to exceed £100. Premium £2 2s. for the selected design, but no other charge or expense. Particulars from George M. Doe, Town Clerk, to whom designs are to be sent.
Mar. 17	NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3.500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council. Stanley S.O., Co. Durham.
Mar. 31	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days.
No date.	PONTARDAWE (WALES). Offices for the Guardians, in Holly Street. Premium £10 10s. The premium is offered by the Guardians "for plans with abridged specification, *which in their judgment* are best suited." Particulars and conditions from C. B. Jenkins, Clerk, Herbert Chambers, Pontardawe, S.O., Glamorganshire.
No date.	BLACKBURN. The Blackburn Small Holdings and Allotments Committee have decided to invite architects and surveyors in the Borough to submit competitive plans for the laying-out of the estate at Oswaldtwistle, recently purchased for small holdings. Premiums of £25, £10, and £5 are offered.

The Cornwall County Offices, Truro.

Fifty-nine sets of designs have been submitted for the above buildings, of which nine, selected by the Building Committee, have been submitted for the adjudication of the assessor, Mr. G. H. Fellowes Prynne, F.R.I.B.A. Considerable indignation has been expressed at the withholding of the fifty other designs from the assessor's inspection, and this is decidedly a matter on which the R.I.B.A. Competitions Committee should take action. It is said that the committee rejected those designs which would obviously cost more than they were prepared to spend; but it is said no limit as to cost was embodied in the conditions.

The Bristol Royal Infirmary.

The assessor, Mr. Edwin T. Hall, vice-president R.I.B.A., has made his award in this competition with the following result:—1st premium, Mr. H. Percy Adams, London; 2nd premium, Messrs. Henman and Cooper, Birmingham; 3rd premium, Messrs. Worthington and Son, Manchester.

Municipal Buildings, Coventry.

At a meeting of the City Council on the 26th ult., the General Works Committee's scheme for new municipal buildings was rejected on an amendment of Dr. Iliffe, which also provided for instructions to be given to procure competitive plans. Presumably, therefore, the institution of a competition may be expected in the immediate future.

Offices for the Stanley U.D. Council, Durham.

We have been asked by Messrs. Speir and Beavan, of Cardiff, to give publicity to the following correspondence, which may be of interest to those who think of entering for this competition:—

Mr. Joseph Routledge,
Surveyor,
Council Offices, Stanley,
Co. Durham,
January 26th, 1909.

New Council Offices.

Dear Sir,—We have duly received a copy of the conditions herein, but wish to draw your attention to the following points:—

(1). No mention of professional assessor. Is one to be appointed, and if so, what guarantee have competitors of his standing? Would he be appointed by the President of the R.I.B.A.?

(2). *Clause* 7.—Some allowance should be made for travelling expenses.

(3). *Clause* 29 is manifestly unfair, and places competitors at a great disadvantage. If these points are amended we shall be glad to compete.

Yours faithfully,
SPEIR and BEAVAN.

[COPY OF REPLY.]

Messrs. Speir and Beavan,
Architects, etc.
January 28th, 1909.

Re Council Offices.

Gentlemen,—Your letter of the 26th to hand.

(1). The Council will be the assessors.

(2). No allowance will be made for travelling expenses.

(3). If you compete you will have to abide by the conditions.

Yours faithfully,
JOS. ROUTLEDGE.

Borough Chambers,
Wharton Street, Cardiff.

REASON IN BUILDING; OR, THE COMMONSENSE USE OF MATERIALS.

Mr. Schultz, at the commencement of his third and concluding lecture at the Carpenters' Hall, on Wednesday evening last, said that he proposed, on that occasion, to touch on the other crafts connected with building, and to endeavour, in the short time at his disposal, to draw attention to the importance of critical observation, and the consideration of all points relating to the economical use of materials. Also, that while it was essential in a design, whether large or small, to get the idea right, yet, it was also important to pay attention to detail, for the success of the work depended as much upon the one as on the other.

He then proceeded to take up the subject where he left off at the preceding lecture. Dealing with the brickwork, he said, get to know, in the first place, the qualities which go to make up a good, sound, reliable building brick. Visit, not one, but many brickfields, for the bricks vary considerably in texture, quality, etc., according to the earth used. For example, we have the old-fashioned London stock. Then there are the hand-made, sand-faced red bricks of the Home Counties; Fletton machine-made bricks from Peterborough, much used in London now; white and red bricks from Suffolk; Bridgewater bricks from the west, and a host of other machine-made, pressed, and wire-cuts, from other parts of the country. The bulk of bricks, he said, are now made by machinery, on account of economy in the cost of production, which in these days of keen competition has to be considered before quality and durability. He next drew attention to the importance of colour, mentioning that the nature of the brick-earth affects this considerably. He drew attention also to the effect that can be obtained by choosing bricks carefully and using varying colours, contrasting the variety of colour in an old brick wall, with the hard even colour of a modern wall. A number of architects, he said, now use second-quality bricks, instead of the "best selected" bricks, as the modern specification usually runs. Forms that involve much cutting in brickwork, he said, should be avoided. Curved forms should be used sparingly, and as to moulded brickwork, this should be built up of simple forms, such as the bull-nose and cavetto, which were commonly used in old work of this kind, and look beautiful. Good effects can also be obtained by slightly projecting a course, or by a row of dentils formed by headers, or bricks placed angle-wise and projecting, etc. He emphasised the importance of bond, particularly in relation to window openings, sizes of piers, etc. Passing on to pointing, he said that the "struck weather joint" so often specified was in practice useless from the point of view of throwing off the water, and recommended a flush mortar joint as being the best. As to the sizes of bricks, four courses to the foot, including mortar joints, was the usual size, and this is especially convenient for designing on paper. He then briefly enumerated several kinds of bricks used in England, such as Dutch bricks and Roman bricks. Brickwork, he said, must be considered differently where it was used alone from when used with some other material such as stone. He referred to St. Luke's Hospital, City Road, as an example of good building, big in scale yet simple and dignified. The new buildings by the side, he said, he did not admire as examples of brick treatment.

Passing on to tilers' work, he pointed out that much discrimination was necessary in selecting roofing tiles. The old hand-made sand-faced tiles, when well made, were lasting enough, but when made badly, were apt to absorb moisture and crack. Consequently, a harder tile with an impervious surface was demanded, and was supplied in the shape of the Broseley tile, which has a slightly vitrified surface. He deprecated the use of the decorative ridge tiles which are so often seen, and for this purpose recommended half-round tiles bedded in cement, as being the simplest and best. Having alluded briefly to the various uses for tilework, such as copings, arches, etc., and also to simple forms of fireplaces, constructed with bricks, tiles, and fire brick, he proceeded to deal with woodwork:—(1) He said, consider the nature of the wood in relation to the design. (2) Don't imitate mouldings and carving suitable to stone or other framing on the outside of houses; this, he said, was encouraged by the pretty-pretty architect, and there was now a passion for what is called half-timber work, which amounted to a craze, and should be discouraged. Wood, he said, formed a delightful lining to a room, and, where panelling could not be afforded, ¾in. boarding rebated and nailed to studding with copper nails in patterns. He then reviewed plumbers' work, and particularly ornamental leadwork, drawing attention to the durability of the material which made it especially suitable for rain-water heads, etc., where iron would need painting. When speaking of plaster, some fine examples of plaster ceilings were shown on the screen, including ceilings from Audley End, and the New River Co.'s Offices. He next described four buildings which have been designed by architects who have endeavoured, in carrying out the work, to get more in touch with the craftsmen employed:—(1) He referred to a church near Reigate designed by Mr. Barnsley, who himself lived on the spot, and personally superintended the work. (2) Kempley Church, Gloucestershire, completed under the personal supervision of Mr. Randall Wells. (3) Kelling Place, Holt, Norfolk, designed by Mr. E. S. Prior and carried out under Mr. Randall Wells, who bought the material and selected the workmen. (4) Roker Church, Sunderland, also designed by Mr. E. S. Prior in conjunction with Mr. Wells; the latter resided on the job and personally directed it.

In conclusion, Mr. Schultz said that if any lasting good is to come, in the shape of commonsense building, the improvement must be gradual, the craftsman must be trained in a sensible manner, and the client must be taught to see that good work is worth more than tawdry pretentiousness.

He also wished the Carpenters' Company every success in the scheme which they had initiated to better the existing deplorable state of things.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

The querist's name and address must always be given, not necessarily for publication.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Such answers will be forwarded to the querists promptly on receipt from the respective experts, but the Editor will not be responsible for any delay that may arise. The fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies. Every effort is made to ensure correctness, but Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

The Editor expressly declines to be held responsible for any mistakes or inaccuracies that may occur, nor does he undertake to satisfy in every instance the querist's demand. The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule be published in these columns.

Smoky Chimney.

In the reply to "L.L.J. (Carnarvon)," in last week's issue, the "Edwardian pot" was mentioned as having proved very efficacious in the treatment of down draughts. The name of the proprietors of the "Edwardian pot" should have been given as Messrs. Mark Fawcett and Company, of Westminster.

Sliding Doors.

SKIPTON.—S. D. writes:—"I enclose herewith a small sketch, showing the construction, according to my design, for sliding doors. Please state, through your paper, whether the construction of this door is correct. I should also like your opinion on the method suggested for fixing the running rail, and shall take an interest in any suggestions you think necessary." [Sketch not reproduced.]

The construction shown would be satisfactory. It is presumed that the central muntin would be continuous and the full thickness of the 2¼in. framing, while the bottom and middle rails and all braces would be barefaced tenoned in, behind the matched filling-in. The method suggested for fixing the running rail over the opening is a suitable one; the continuation at side of opening should be pinned in cement into a joint of the brickwork. It is usual to have in addition a grooved guide, or guide rollers on bottom edge of door, working over (but not bearing on) a T iron rail, as otherwise the secure fastening of the door is a matter of difficulty, since it may be swung away from the wall. There is always the risk that this type of door may become accidentally dismounted from the rollers. A safer means of hanging is by one of the patent forms of ball-bearing hangers, such as the "Coburn," in which the track encloses the rollers, and prevents jumping, as well as affording protection against the presence of obstructions tending to accidentally jamb the runners.

G.

Liability for Defective Drainage.

HULL.—R. R. G. writes:—"I should be much obliged if you can inform me of a parallel case to the following; whether it has been tried in court, and if any damage has been awarded the tenant from the landlord. A house is let to a tenant, and is stated to be in perfect order, particularly with regard to the drains. After the tenant occupies the house the drains are found to be defective. Illness results, and the tenant has to leave the house. It was known by the landlord that previous tenants had to leave through illness caused by defective drains aforesaid."

In answering this question, I must assume that the tenancy refers to an unfurnished house, and not to a house which comes under the designation of "for the working class." The landlord is under no obligation whatever unless (1) he covenanted to put the drains in order on entry, or (2) he gave an undertaking which amounted to a warranty that the drains were in good order at the time he let the house. Woodfall clearly expresses the law thus:—"A landlord may, of course, take upon himself to do all or any of the repairs during the term, by an express covenant or promise to that effect in the lease or agreement; but in the absence of any such stipulation he is not liable to do any repairs whatever. Whatever he agrees to do in this respect should be inserted in the lease or agreement; the tenant should not rely upon any oral promise made before the lease or agreement is executed. There is no implied duty in the owner of an unfurnished house which is in a ruinous and unsafe condition to inform a proposed tenant that it is unfit for habitation; and no action will lie against him for an omission to do so, in the absence of express warranty or active deceit."

F.S.I.

Compensation for Compulsory Acquisition.

TWICKENHAM.—T.H.S. writes: "A borough council are compulsorily acquiring properties under the provisions of the Housing of the Working Classes Act, for the purpose of improving a certain portion of the district. Certain of the properties to be acquired are copyhold, and, as such, under the customs of the manor are subject to an arbitrary fine or admission, a small annual quit rent, and a heriot at death. The valuer for the copyholders fails to agree to the compensation offered by the corporation. Please give your opinion on the following points:—(a) The compensation claim consists of the amount paid for property at a recent public auction, plus law expenses, plus admission fine. The surveyor to the corporation refuses to offer more than the sum paid at the auction sale. If this sum is accepted, the claimant has a considerable direct loss, as under (figures not actual):—

Price paid at auction ...	£100
Law expenses, etc.	10
Admission fine	50
Total ...	£160

Amount offered by corporation £100. Under these terms the claimant is £60 to the bad. If the corporation acquire this property, his name will be removed from the Manor Roll, and consequently a fresh admission fine will have to be paid should he purchase another copyhold afterwards. (b) If, however, he purchased another copyhold property before the corporation purchases his present holding, he will be admitted on the second property at a nominal fine. This will prevent his losing the whole of the original admission fine; but as he will not be able so easily to secure a small copyhold, he will be compelled to purchase larger premises, thus expending money in excess of his desires, and at some inconvenience to himself. I offer, as an alternative valuation:—Purchase price of property No. 1 £100 plus law expenses, and nominal admission fine incurred in purchase of second property. Is my contention right in either case? Rental is not much guide as to value, as these small copyholds have an enhanced value from the fact that they are frequently sought after by proposed purchasers of larger property in order to reduce the amount of the admission fine, which, though arbitrary, has generally some relation to the value of the property."

The Housing of the Working Classes Act, 1890, empowers the local sanitary authority to close houses which are unfit for habitation, and, if necessary, to demolish them. It gives power to any person who is aggrieved to appeal to Quarter Sessions (Section 35). Further, the Act empowers the sanitary authority to pull down and remove any obstructive building, and under certain circumstances to purchase the property in question (Section 38), but these powers are of a very carefully guarded kind, and I advise you to study the Act before taking any decided step in the matter. To answer your questions as you put them:—(a) I think that in any case admission will have to be paid whenever your client purchases additional property in the manor. Personally I know of no manor in which the admission in respect of the copyhold tenement frees a tenant from the necessity for admission in respect of another tenement, subsequently acquired. (b) The amount which the sanitary authority should pay is the sum which the property is now worth, and, taking all the circumstances into consideration, of course they must also pay the customary ten per cent. for "compulsory taking." It is, naturally, quite competent for you, in support of your claim, to advance arguments as to the original cost of the property (and in this connection I quite agree with your contention that the legal expenses and the payments to the lord of the manor should be included, because they were necessarily parts of the purchase money), but the original cost has no real bearing upon the present value of the premises. I do not follow your final argument about the enhanced value of small copyholds generally, but it is possible that the exceptional custom of which you speak may exist in the particular manor with which you are dealing. The steward would at once tell you.

The Housing of the Working Classes Act, 1890, incorporates many of the provisions of the Lands Clauses Acts, and the procedure must be in accordance therewith.

After a notice to treat has been served, the owner must send in a formal claim; if the amount claimed be over £50 the owner may elect whether, in case the claim is not paid, he shall go to a jury or have the amount settled by arbitration.

No unnecessary delay must take place in any case, but should he go to a jury, they must be summoned within twenty-one days, and will, of course, give an immediate verdict.

The purchase must be completed within one year of the first making of the order by the local authority (Section 38, 4). I advise you to get a copy of the Act. The cost is merely a few pence.
F.S.I.

Models for Honours, Carpentry and Joinery.

We have received a letter for "Sydney," Stockport, whose enquiry we answered last week. Our expert not having preserved the original letter, we are without "Sydney's" name and address, but if he will send these on we will forward the letter to him.

Copper for Roofing.

Birmingham.—X.Y. writes:—"I think of covering a dome with copper. Can you tell me whether there is any distinct advantage in this material proportionate to its extra cost as compared with lead? Also do you know of any means whereby it can be made to go green (as on Continental domes), instead of the smoky black usual in manufacturing towns?"

In certain cases copper possesses several manifest advantages as compared with lead as a roofing material. Being both harder and tougher than lead, and less subject to the expansion and contraction caused by changes of temperature, it is not liable to "crawl" in the way in which lead roofing does when laid on a steep pitch. If well executed at first, copper roofing is practically indestructible by weather, and needs no repair; it is also both lighter than lead and more fireproof; though these latter advantages are probably not of great importance in the case mentioned. The green colour (not peculiar to Continental domes; e.g., Hampstead Parish Church spire) is due to a film of basic ecetate of copper (verdegris), formed by exposure to the atmosphere. When undisturbed, this film prevents further decay. It may be simply produced by chemical means (see "Builders' Journal," Vol. xvii., No. 430), but is not permanent in the atmosphere of a manufacturing town. As to the relative cost of lead and copper roofing, in the present state of the market, 12ozs. copper should be comparable in cost with 6lb. lead, so that the "extra cost" should be practically negligible.
G.

Strength of Compound Girder.

Birkdale.—Calculator writes: "How is it possible to calculate a compound girder formed of two R.S.J.'s and one plate above connecting the two, this plate to take a portion of the stress?"

The strength of a compound girder built up of two R.S.J.'s and one plate above can be found in the following manner:

Let A = area of each joist in sq. in.
,, a = area of the plate in sq. in.
,, I_J = moment of inertia in inch units of each joist about the line XX.
,, i = moment of inertia in inch units of plate about line YY.
,, I = moment of inertia in inch units of whole section about line CC.
,, z = section modulus in inch units of each joist.
,, Z = section modulus in inch units of whole section.
,, d = distance in inches from centroid of section to centre of plate.
,, x = distance in inches from centre of joists to centre of plate.
,, y = distance in inches from centroid of section to extreme edge.

The quantities A, I_J and z above are taken from the tables of properties of standard sections given in Section Books.

The quantity $i = \frac{bt^3}{12}$ is generally negligible.

Then we have:—$d = \frac{a\,x}{2A}$ .. .. (1)

$I = 2I_J + 2Ad^2 + i + a\,(x\text{-}d)^2$ .. (2)

$Z = \frac{I}{y}$ .. .. (3)

Then if f is the safe stress, the safe B.M. will be equal to f Z.

Taking f as 7 tons per sq. inch, and the span L inches, if the load W is evenly distributed we have $\text{B.M.} = \frac{\text{W.L.}}{8} = 7\,Z$

$$\therefore W = \frac{56\,Z}{L} \text{ tons,}$$

or if w is the safe load for the given span and kind of loading for *each* joist, the safe load W on the compound girder is $= \frac{w \times Z.}{\,}$

The following numerical example should make this quite clear: Take the case of two 10 in. × 6 in. joists with a 14 in. × $\frac{5}{8}$ in. plate above them.

From the tables we see that:
$A = 12.35,\ I_j = 211.5,\ z = 42.3.$
Also $a = 8.75,\ x = 5.312.$

$$\therefore d = \frac{8.75 \times 5.312}{2 \times 12.35} = 1.88 \text{ in.}$$

$$\begin{aligned} I = 2I_j \quad .. \quad .. \quad .. &= 423 \\ 2Ad^2 = 24.7 \times 1.88^2 &= 87.4 \\ i = \frac{14 \times (\frac{5}{8})^3}{12} \quad .. &= \cdot 3 \\ a\,(x\text{-}d)^2 = 8.75 \times (3.53)^2 &= 109 \\ \hline &\ \ 619.7 \end{aligned}$$

$y = 5 + 1.88 = 6.88$ in.

$$\therefore Z = \frac{619{\cdot}7}{6.88} = 90 \text{ in. units nearly.}$$

$\therefore$ If w is the safe load for the given span for each joist,

$$\frac{W = w \times 90}{42.3} = 2{\cdot}13w.$$

It will be noted that this is only about 6% more than for the two joists without the lapet.
A.

THE STABILITY OF WALLS.*

By Henry Adams, M.Inst.C.E. etc., Member of Council, The Society of Architects.

(*Continued from page 83, No. 729.*)

Stresses on Given Wall.

Now suppose we wish to determine the safe height for a 9in. wall in stock bricks and grey lime mortar, the formula and table show that the probable wind pressure will vary with the height and length, but in the case of a boundary wall it would manifestly be unsafe to take the whole length in estimating the wind pressure, as it is possible for a portion of it to blow down and leave the remainder standing. If there were buttresses we should limit the width taken into consideration as equal to the distance from centre to centre of the buttresses, or say 1½ times the height, and this is a reasonable length to take into account if there are no buttresses.†

Assume 6 ft. height above ground as in Fig. 11, = 3 ft. as the height to centre of gravity, and 9 ft. as the length, and by formula (6) $\log p = 1{\cdot}125 + 0{\cdot}32 \log 3 - 0{\cdot}12 \log 9 = 1{\cdot}125 + 0{\cdot}1526788 - 0{\cdot}1145091 = 1{\cdot}1631697$, whence $p = 14{\cdot}563$ lbs. per sq. ft. Then by formula (13) the stress on the two edges will be $S = \frac{W}{A} \pm \frac{M}{Z}$, or by formula (14) which is more convenient for this case, $S = wh + \frac{3ph^2}{t^2} = 112 \times 6 \pm \frac{3 \times 14{\cdot}563 \times 6^2}{{\cdot}75^2} = \begin{matrix}+3468\\-2124\end{matrix}$ or 1·55 tons per sq. ft. on the compression edge and .95 tons per sq. ft. on the tension edge, from which it is clear that we could not safely have made it any higher, or the wall would have been liable to fail by tension on the windward side. In small walls like this there is a contingency which it is practically impossible to provide against, and that is overturning by frost, although good mortar will minimise the risk. About the year 1880 the author was concerned with a case where an average length of 20ft of four 9in. brick party-fence walls 5ft. high, dividing adjacent properties, was overturned in the same night apparently from this cause. The walls ran east and west, and a rain driving from the north was followed by a sudden sharp frost. There was at the same time some wind, but not nearly enough to cause any risk to the walls without the frost, and they all fell southwards.

Relative Height and Thickness.

It would be an advantage if the thickness requisite for a wall of a given height could be directly determined, but it could not be done from the above data. The following table may, however, assist in designing plain boundary walls upon the basis of formulæ (7) and (16):—

Safe Thickness of Plain Boundary Walls.

Height of wall in feet.	Wind pressure allowed for in lbs. per sq. ft.	Thickness required in feet.		
		For compression.	For tension.	say
5	14.04	.41	.61	1 b.
6	14.56	.5	.73	1 b.
7½	15.22	.66	.91	1½b.
10	16.13	.93	1.20	2 b.
12	16.87	1.16	1.42	2 b.
15	17.09	1.51	1.71	2½b.
18	18.13	1.03	2.03	3 b.
20	18.52	2.23	2.23	3 b.
25	19.82	3.0	2.67	4 b.
30	20.09	4.0	3.10	5½b.

---

*Substance of a paper read by Prof. Henry Adams, M.Inst.C.E., etc., before the Society of Architects, on January 14th.

†The author of "Notes on Building Construction" (Vol. IV. p. 227) calls a long enclosure wall one whose unsupported length is more than about ten times its height. He says that shorter walls than these receive considerable support from each end. This, however, seems to the writer too great a length to take into account in estimating the stability against wind pressure—owing to the fact that enclosure walls are more liable to "scamping" work than ordinary walls, and the mortar is more liable to deterioration from frost and damp. Perhaps a suitable rule for length to be taken into account would be say 15 to 20 times the thickness.

The figures are plotted to curves on diagram Fig. 12, and it is interesting to note that below 20ft. high the wall would be likely to fail by tension and above 20ft. by compression, as the curves cross each other at that limit. Curves for the other formulæ are also shown upon the same diagram.

In deciding upon the thickness of a wall it should be remembered that the compression may be increased with less risk than the tension.

Hurst's Formula.

Hurst's "Architectural Surveyors' Handbook" (13th edition, p.121) gives a formula for the stability of enclosure walls as follows:—

f = the adhesive force per foot super attained by the mortar at the end of say 6 months, for brickwork in cement mortar 1 cement to 1 sand = 6,000 lbs, 1 to 2 = 5,000, 1 to 3 = 4,000; for brickwork in grey lime mortar 1 to 2 = 3,600; for brickwork in ordinary lime mortar 1 to 2 = 3,000.

H = height in feet above ground.

P = pressure of wind in lbs. per foot super, say 40.

T = thickness in ft. of a wall with vertical faces and without buttresses.

W = weight of wall in lbs. per cubic foot, = 112 for brickwork, 145 for Portland and similar stones, 166 for granite.

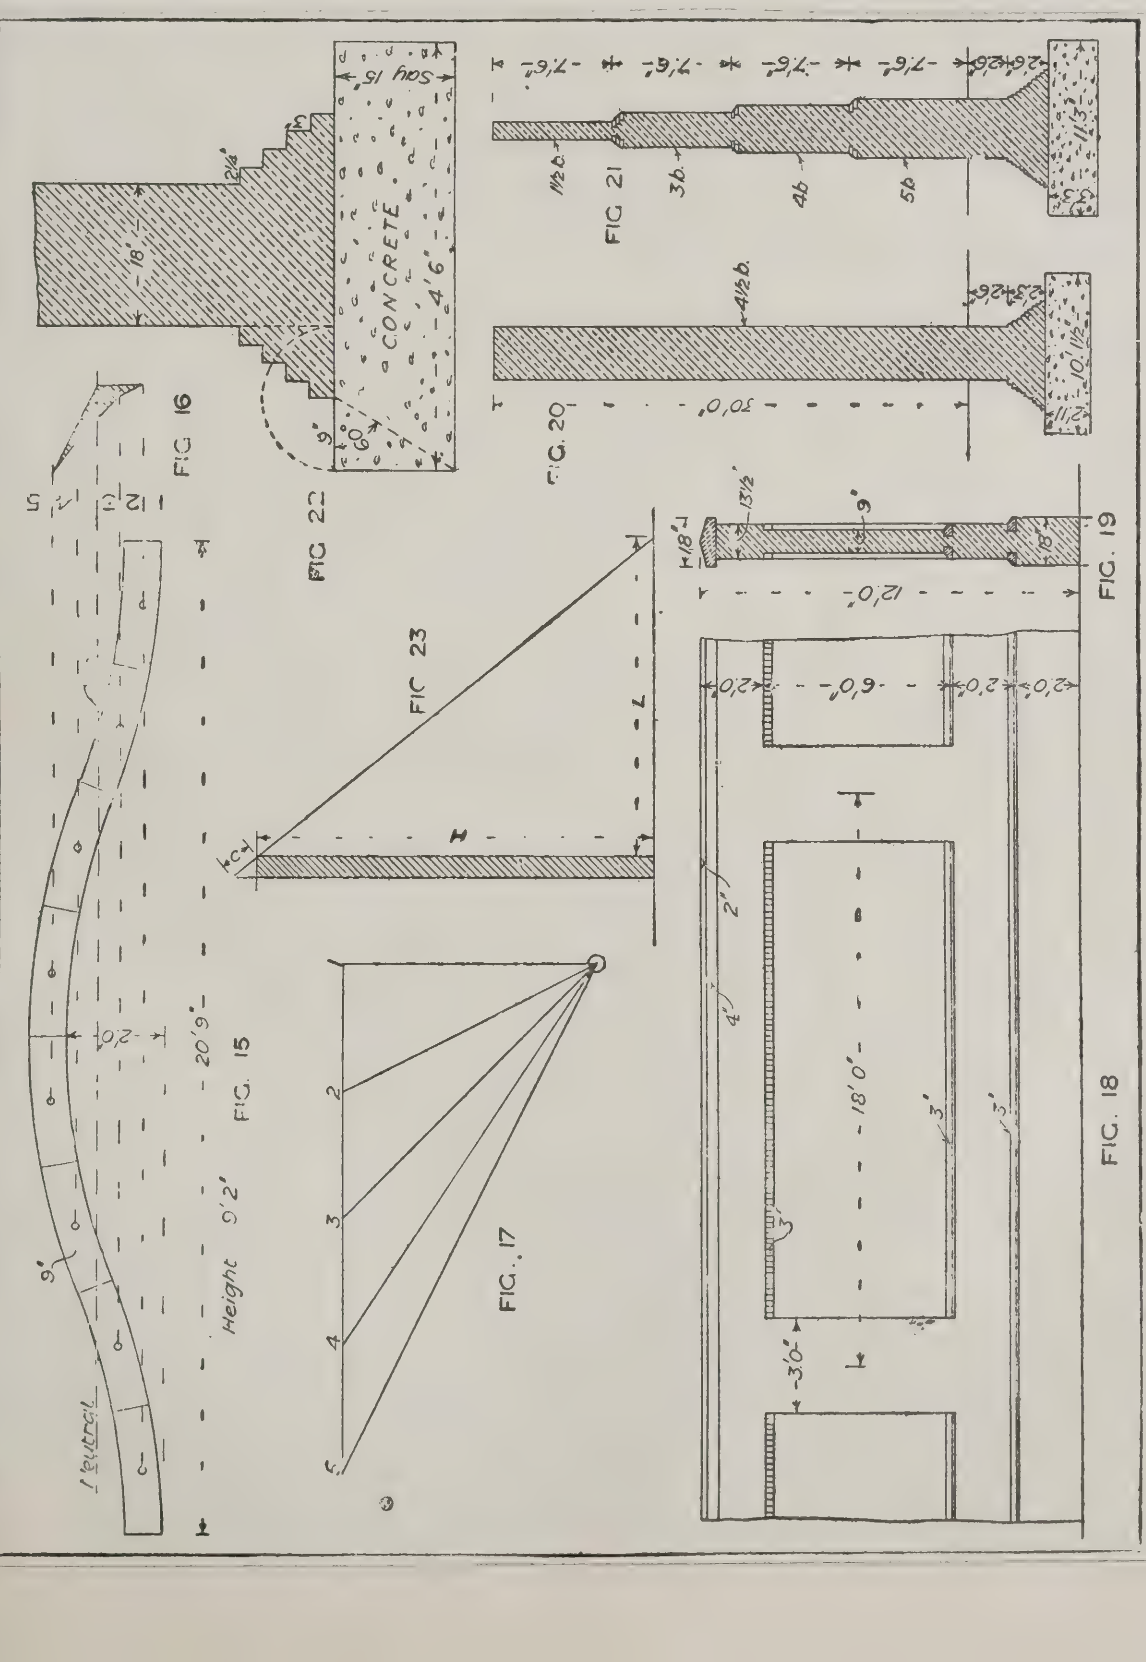
The formula is given as $T=\sqrt{\frac{PH^2}{\frac{1}{3}f+HW}}$ but there is a very serious omission in it which leads to totally incorrect results. It looks as if the $\frac{1}{3}f$ stands for safe load $\frac{1}{3}$ of ultimate tensile strength of mortar, but this is not so. There should be brackets inserted as follows:—

$$T=\sqrt{\frac{PH^2}{\frac{1}{3}(f+HW)}} \quad \ldots\ldots\ldots\ldots (20)$$

which is identical in form with (18). The different values for some of the items in this formula will, however, give the thickness required for various heights as in the following table, the wind pressure being constant at 40lbs. per sq. ft.

Height of wall in feet.	Thickness required in feet.	Practical thickness.
5	.91	1½ b.
6	1.08	1½ b.
7½	1.33	2 b.
10	1.73	2½ b.
12	1.99	3 b.
15	2.40	3½ b.
18	2.77	4 b.
20	3.01	4½ b.
25	3.60	5 b.
30	4.12	5½ b.

The required thicknesses in this table have been added as a dotted curve on Fig. 12 for comparison with the author's own values, which he believes to be safe.



PAPER ON STABILITY OF WALLS. PLATE 2

A straight line formula has also been given for the thickness of fence walls, viz.:—

$$h-6\tfrac{2}{3}\,t \quad \ldots\ldots\ldots\ldots \quad (21)$$

$$\text{whence } t=\frac{3h}{20}- \quad \ldots\ldots\ldots\ldots \quad (22)$$

This would give proportions as shown by line A on Fig. 12.

For a practically safe and simple rule the author would suggest that the minimum thickness of any fence wall should be 1-9 of the height which is shown by line B on Fig 12.

Practical thickness.		Maximum height.
1 b.	...	6 9
1½ b.	...	10 1½
2 b.	...	13 6
2½ b.	...	16 10½
3 b.	...	20 3
4 b.	...	27 0

Walls with Piers.

A boundary wall may be strengthened by the simple addition of projecting piers or pilasters built at intervals of say 1½ to 2½ times the height or 15 to 20 times the thickness on one or both sides of the wall: either opposite each other or "breaking joint" with each other at equal intervals. Technically a pier on the side next the wind is a counterfort, and a pier on the opposite side is a buttress.

(To be concluded.)

Proposed New Works.

GLASGOW, BRIDGETON.—A new R.C. church is to be erected in Old Dalmarnoch Road at a cost of about £10,800.

CHESTER.—Messrs. Milton Bode and Co. have acquired a large site on City Road, Chester, for the erection of a new music-hall.

CREWE.—A new police station is to be erected in Ford Lane, at an approximate estimate of £2,000. The county architect has been instructed to prepare plans for same.

HALESOWEN. — The Worcestershire County Council are about to erect a small-pox hospital to serve the Stourbridge and Halesowen Hospital district. Mr. H. E. Folkes is the architect. A L.G. Board enquiry has been held.

LEICESTER.—The Town Council are considering the erection of baths for Aylestone and Knighton at a cost of £6,000.

LONDON. W.C.—Holy Trinity Church, Kingsway, which, as we previously reported, has been undermined and rendered unsafe by the tunnelling operations of the L.C.C. and the tube railways, is to be rebuilt at a cost of £8,000, of which £4,000 is in hand.

MANCHESTER: CRUMPSALL. — The Free Library Committee of the Manchester Corporation contemplate the erection of a library at Crumpsall at an estimated cost of £8,000.

NORTHAMPTON.—Plans for a new hippodrome to be erected in Abington Street have been submitted to the Town Council.

ORSETT, ESSEX.—A L.G. Board enquiry has been held with reference to the proposed extension of the workhouse at a cost of £8,800. Mr. C. M. Shiner is the architect.

PLYMOUTH, MILLBAY.—It is proposed to carry out a scheme of improvements in connection with the barracks here, and an application by the Plymouth Town Council for a loan of £2,000 for street works in connection therewith will shortly be made.

SUTTON-IN-ASHFIELD.—It is proposed to buy an acre of land on the Huthwaite Road for the purpose of erecting a new school. The sanction of the Notts County Council to this purchase is now awaited.

SWANSEA.—Plans and estimate for a new drill hall to cost £19,050, have been accepted by the Glamorgan County Territorial Association.

WEYBRIDGE.—In connection with the motor track at Brooklands, a scheme is contemplated for the formation of a test hill for motor cars. The surface of the test track would probably be covered with concrete, 6ins. in thickness.

Proposed London Buildings.

LONDON.—The Building Act Committees of the London County Council, in the agenda presented at the Council meeting held recently, recommend that consent be given to the following works:—

Erection of a church on the northern side of Culmstock Road, Clapham Common, to abut also upon the eastern side of Alfriston Road, on the application of Messrs. J. S. Quilter and Son, on behalf of Canon J. E. Clarke.

Erection of one-storey shops on the north-eastern side of Railway Approach, Brockley, and a one-storey shop in front of No. 2, Foxberry Road, on the application of Messrs. Webster and Forbes, on behalf of the trustees of the late James Martin.

Erection of a building upon a site abutting upon Dantzic Street, Earl Street, and Providence Place, Southwark, at less than the prescribed distance from the centres of the roadways of the said streets. on the application of Messrs. C. Yates and Co., on behalf of Messrs. R. Hoe and Co.

Erection of four blocks of working-class dwellings abutting upon the southern side of Hastings Street, St. Pancras, and the western side of Tonbridge Street, with an irregular open space about such buildings, and with projections, external steps and gangways in front, on the application of Mr. A. Davis.

Construction of a one-storey superstructure to a portion of the underground sub-station at Shorts Gardens, Holborn.

Construction of additions at the electricity generating station situated on the eastern side of Grove Road, St. Marylebone.

Erection of a building on the western side of Tower Bridge Road, Bermondsey, to abut also upon the southern side of Tanner Street, on the application of Messrs. Western and Sons, on behalf of the City of London Brewery Company, Limited.

Erection of a one-storey building on the western side of Upper Street, Islington, northward of St. John's Place.

Erection of shops at Nos. 45 and 46, Rostella Road, Wandsworth, to abut also upon the north-eastern side of Thurso Street, on the application of Mr. F. G. B. Crawley, on behalf of Mr. W. Newman.

Erection of houses to be inhabited by persons of the working class on the sites of Nos. 17 and 19, Crosby Row, Southwark, at less than 20ft. from the centres of Plaintain Place and Dove Place, and exceeding in height the width of those streets, on the application of Mr. J. J. Freeland, on behalf of Mr. T. B. Benton.

Erection of a building on the south-western side of Dantzic Street, Southwark, abutting also upon St. George's Market and the roadway leading out of the north-western side of St. St. George's Market, on the application of Mr. W. F. Hurndall.

Erection of buildings on the northern and southern sides of Ferry Street, Lambeth, at less than the prescribed distance from the centre of the roadway of such street, on the application of Messrs. Buckland and Gerrard, on behalf of Doulton and Co., Limited.

Works in Progress and Completed.

BURGH HEATH, SURREY.—The new church of St. Mary has been dedicated. The building has been erected at a cost of about £5,000, and seats 400. Mr. Alick Thomas is the architect.

CALCUTTA.—The City Corporation has accepted (subject to formal Government sanction), the tender of Messrs. Clayton, Sons and Co., of Hunslet, Leeds, for the construction of a steel water tank to hold 9,000,000 gallons. Amount of tender, £91,367. Competition for the contract was open to the world.

DERBY.— A new Congregational Chapel is being built in Ashbourne Road. The building, which is designed to seat 500 persons, will cost £3,000.

ECCLES.—The new Eccles Rubber Co. are again extending their premises in Monton Road, Eccles, their architect being Mr. W. Canning, of Manchester. The reinforced concrete floors, with granite finish, are being carried out by Messrs. Homan and Rodgers, Manchester.

HARROGATE.—The erection of a roller skating rink will be commenced immediately. Mr. J. Houfe is the architect.

HEXHAM.—The erection of eight six-roomed cottages, suitable for professional and business men, has been commenced. Each site will cover about 900 square yards. The estate is about one mile from Hexham station, and near to the Hydro. Each cottage will command a fine view of the surrounding country. The planning of the estate has been entrusted to Mr. Ed. Cratney, architect, Wallsend, who, at the recent Model Cottage Exhibition at Walker, was awarded medals in every class for cottages.

MONKWEARMOUTH.—A new Carnegie Library has been commenced, to cost £10,000. The library will be arranged on the "safeguarded" open access system. The elevations are designed in a quiet treatment of free Renaissance, the walls will be built of Withnell bricks, with Springwell stone dressings, and the roof will be covered with blue Welsh slates. The floors of the main rooms will be laid with maple wood blocks. The whole of the woodwork in the main rooms and the interior fittings will be executed in oak. The building has been designed and is being carried out under the supervision of Mr. Edward Cratney, of Davidson and Cratney, Wallsend and Sunderland, the designs being selected in competition. The contractor is Mr. Joseph Huntley, of Sunderland, and the carving will be executed by Mr. C. Neuper.

NEWCASTLE: BENWELL.—A new Carnegie Library has been completed here at a cost of £5,500. The contractors were Messrs. J. Parkinson and Sons, Ltd., Newcastle, and the whole of the work has been carried out under the direction of the city architect, Mr. F. H. Holford. This is the fourth branch library in the city, the three others having been provided by Ald. Sir W. H. Stephenson, at Elswick, Heaton, and Walker.

NEWPORT, MON.—A new Y.M.C.A. building will be started this month. The cost is estimated at £7,500.

TIREE (HEBRIDES).—A new pier is to be built here in Gott Bay. It will be a monolith reinforced concrete structure, 520ft. long, with a boat slip 170ft. long on the harbour side, with an open viaduct 204ft. long, constructed to join the pier head, which will be hammer shaped, 150ft. long. The engineer for the trustees is Mr. G. Woulfe Brenan, M.Inst.C.E., and the engineer for the Secretary of State for Scotland is Mr. Walter G. Coles, Edinburgh. The estimated cost is £13,000.

WIGAN.—A new public hall, to be known as the New Pavilion, is being erected here from the designs of Messrs. J. B. and W. Thornley. The roof has a clear span of 112ft., carried on steel stanchions independent of the walls, and the steel construction is of elaborate design. The ventilating arrangements include a Shorland's latest extractor at the top of the dome, which is 24ft. in diameter. A feature is the floor, which is of maple, so that the hall can be used for roller skating, a pastime which is at present the rage in all the large towns and cities. The hall is also so constructed that it can be used for political meetings, dances, concerts, also as a circus or music hall. It is expected that the holding capacity will be 3,500. The whole of the steel work has been designed, manufactured, and is being erected by Messrs. J. Booth and Sons, Hulton Lane Steel Works, Bolton. The brick and woodwork by Messrs. John Johnson and Son, Caroline Street, Wigan. The cement and plaster work by Messrs. J. B. Johnson and Co., Liverpool, and the slating by Messrs. J. Liptrot and Sons, Pemberton.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

EARTHQUAKES AND FRAME BUILDINGS.

The catastrophe at Messina and the other towns in the neighbourhood has served to teach a further lesson in regard to what should and what should not be the nature of building construction in districts subject to earthquake shock. The Messina disaster, like those of San Francisco and Kingston, Jamaica, was not primarily due to some overwhelming action of nature such as caused the destruction of Pompeii, Herculaneum, or even the recent eruption of Mont Pélée, but to the secondary effects of what can only be called inefficient building—inefficient in so far that it did not resist earthquake shock, for which it was never designed. The building construction of Messina was, indeed, more frail than San Francisco, though the latter city had cheaper and less permanent erections as a whole, for it was a town largely of timber-frame dwellings. Messina was a town of greater permanency with regard to resistance to the decaying influences of time and the ravages of fire, but it has been proved that it suffered more by earthquake shock than San Francisco, for, destructive though it was, comparatively much less damage was done; and the chief destruction at San Francisco was attributable to the fires that followed, and which the timber-frame buildings and the more expensive and larger structures in the narrow main streets were ill able to resist, the disastrous effects being heightened also by the absence of water for contending with the flames, due to the destruction of the city's water mains. Both Kingston and San Francisco were passing through the stage of elementary development from a nucleus of timber-framed construction, erected by early settlers and colonists, which, though it had the merit of economy and rapidity of dwelling, was obviously unsuitable for the later civic development, where fire protection becomes of such great importance. Messina, on the other hand, was no mushroom growth, and its new buildings were erected with due regard to Italian traditional methods of construction, and with some attempt at civic planning and fire protection. Loss of life at San Francisco and Kingston was small compared with Messina, and the magnitude of the latter is directly attributable to its "superior" construction, strange to say. But that superiority was only as regards resistance to weather, wear and tear, and fire—against earthquake shock Messina was even less prepared.

The first lesson to be learnt from this disaster at Messina is as to the manner in which to construct buildings that may be subjected to earthquake shock. There are many parts of the earth which are more or less frequently subjected to more or less severe earthquake shocks, and the towns in such districts are often of considerable magnitude, so that lives and limbs of thousands of persons may be endangered and valuable property wrecked, resulting in ruin to the inhabitants and others who have invested capital therein. The complication of modern civilisation and the increased magnitude of modern buildings have made the problem of constructing buildings to resist earthquake shock take an importance that was never realised in the past, and these catastrophes at Messina, San Francisco, and Kingston have brought the problem into prominence. San Francisco's earthquake put several methods of building construction to the test, and Messina has confirmed the conclusions arrived at from a study of the effects evidenced at the former. It is now about 12 years since the Japanese Government issued a report upon buildings to resist earthquake shock, which contained some very valuable recommendations. That report was concerned with timber-frame dwellings, and, briefly, it may be said that the advice was to bolt every part of the construction together (floors, walls, and roof), and build the structures one floor high and with as light wall construction as possible. In Japan, of course, the walls often are not walls (if we may use the paradox)—they are simply screens of mats, paper, or cloth. Such a construction may be all very well for scattered dwellings, but is impossible for a modern large European or American city. However, the principle of bolting together all parts of the building holds good for larger and heavier buildings. In earthquakes, eye-witnesses have agreed in recording, the earth is raised and depressed just like the surface of water—there are distinct waves of earth that travel forward like billows on the sea. The simile is close, and we may draw some conclusions from it. If we wish our ships or rafts to stand the racket we take care they are strong enough to act as beams resting at the ends on the points of two waves. The ship is rigidly framed together and rides the waves. It is strongly made so as not to break its back. To deal with earthquake waves we might presumably adopt a somewhat similar construction, framing the parts together, rigidly connecting all, so that it may float on the waves and act as a beam between two waves raised, say, at its extreme edge. So far as we can judge, that appears to be the method of construction that does successfully resist earthquake shock. In San Francisco there were a number of steel frame buildings, and a few reinforced concrete buildings. These all withstood the shock, that is to say, they did not fall to the ground like a pack of cards. But the steel frame structures were in some cases distorted and warped, and the walls suffered destruction, for they had never been built with any idea of having to resist an earthquake. The foundation of a ship is homogeneous, i.e., raftlike, but the foundations of most of the steel frame buildings were independent and rose and fell unequally like a series of floats. If they had all been standing on raft foundations they might have been tipped about at a great angle, but would have come to no harm, and if they did not recover their equilibrium they could have been placed on an even keel by removing the earth eminences under them or by raising them by jacks and filling up the depressions. The walls should have been securely tied to the framework, so that they, too, would have kept in place when out of the vertical. The reinforced concrete buildings stood even better than the steel frame structures, for their construction was more monolithic in character. Reinforced concrete is noted for its elimination of vibration. Reinforced concrete walls have elasticity, and are one with the rest of the building, so that they cannot come away. At Messina the same lessons are to be learnt. So far as we can learn at present, the few steel frame and reinforced concrete frame buildings remain standing, but all combination structures of steel girders or reinforced concrete girders and floor slabs resting on brick walls have fallen—the walls were shaken out, and down fell the floors. The solution of the problem, then, appears to lie in the construction of rigidly connected frame buildings, preferably of reinforced concrete with reinforced walls banded to the frame, and the foundations of raft form and not independent. On this basis architects and engineers will have no difficulty in ascertaining the possible stresses, and in effectually safeguarding a building from collapse, if subjected to earthquake shock

The Messina catastrophe should serve as a warning and a lesson confirming other recent catastrophes; and it is to be hoped that the architectural and engineering professions will do their best to mould public opinion into a better appreciation of the importance, firstly, of fire-resisting construction and fire-preventive planning, and in districts where earthquakes are probable, to embark on an era of rebuilding at once in accordance with the now ascertained principles of how to construct buildings to resist shock.

The public does not grasp the significance of even such disasters as these earthquakes, nor the great fires that have destroyed large towns; and, indeed, it is evident that the architectural and engineering professions, and public officers appointed to safeguard us against fire and bad construction, have failed to learn the lesson completely, although it has been taught often enough in all conscience. No proper regard is paid to fire protection, either as regards the limitation of cubical contents, separation of risk, width of street, fire-resisting construction, and fire-extinguishing appliances in the erection of modern buildings. There are regulations, but they are meagre, and every building owner seems to seek to evade them instead of trying to go one better and interpret them fully. It is, of course, attributable to lack of public interest and lack of public knowledge and understanding, but that can only be affected by a campaign of professional advocacy. This policy of laissez faire among the architectural and engineering professions and officialdom should end. The insurance companies should have been the first to recognise the advantage of fire-resisting construction and improved planning, and in their own interest should have fostered it by offering inducements to building owners; but they have been strangely lax in the majority of cases.

MAKING CEMENT WITHOUT BURNING ALL INGREDIENTS.

Some patents have recently been taken out in the United States by Mr. Henry S. Sparkman and Ellis W. Lazell—two well-known cement chemists and engineers—for a process of cement manufacture which is novel and almost startling. Instead of making a cement by the ordinary process of burning the ingredients, and then grinding the resulting clinker, by this new process a material is produced by admixture and burning that is called an "accelerator," which when added to other unburnt constituents found in cements and limes, renders them active cements. Thus if the accelerator is added to mixtures of lime and clay, shale, and other siliceous material in their natural condition, a cement that appears to be practically the same as artificial cement made by the ordinary process is produced. The accelerator may also be used with natural and other cements and hydrated lime and trass. The accelerator consists of calcium aluminate made from lime and Kaolin clays, bauxite, or other high alumina materials. Hydrated lime that does not exhibit any hydraulic properties becomes hydraulic and has high strength by the incorporation of the accelerator in large quantity, while a small proportion renders the lime valuable for wall plaster. The cements made by the addition of the accelerator to other ingredients entering into the composition of Portland cement can be regulated in strength by the proportion of the accelerator added, while the setting time is regulated by the use of suitable proportions of retarders, such as gypsum.

A REINFORCED CONCRETE AQUEDUCT.

By Robert S. Walker.

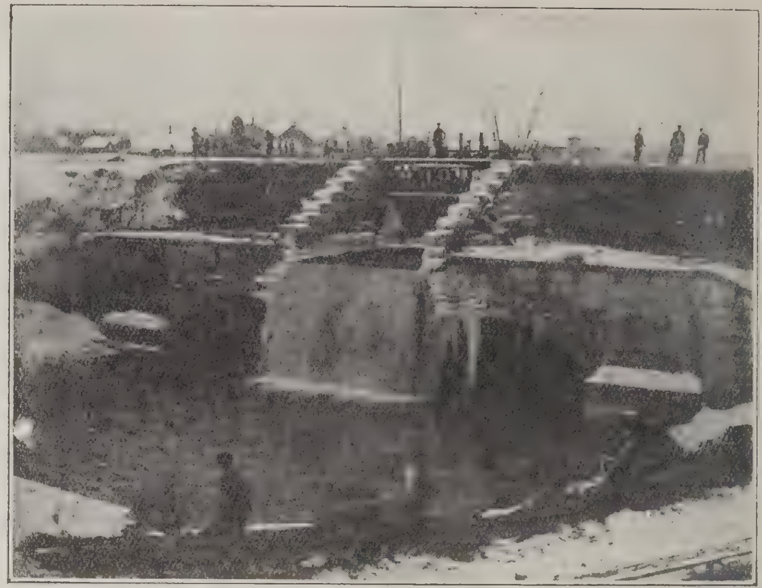


FIG. 1.—OLD AQUEDUCT WITH SLUICE GATE OPEN TO DRAIN CANAL.

The work here illustrated was carried out for the State of New York at Durhamville, near Oneida, to replace an old stone structure which carried the Erie Barge Canal across the Oneida River, and had become so dilapidated as to cause several bad washouts. It may be mentioned that the canal at this point is part of a 60-mile level stretch between locks, so that the seriousness of a washout can be well imagined.

The work of replacing the old structure had of necessity to be carried out in midwinter, so that navigation should not be interfered with in any way. Furthermore, as is customary in N.Y. State, all the canals are drained off every winter, suitable intervals being chosen along the route where a river or stream is convenient to carry off the water, and sluice gates built in the canal banks for this purpose. Such a set of gates are located at the Durhamville aqueduct, as will be noticed from Fig. 1, which shows the canal being drained off.

Work was commenced in November, before all the water had run off, in order to save time, since the contract called for the completion of the work in the first week of the following May, this being the usual time for navigation to be resumed.

It will be noticed from Fig. 1 that the old structure consisted of two arches, so the method of carrying out the work devised was to place cofferdams across the up and down stream ends of the eastern arch, and in this way divert all the river through the remaining or western arch. Then centrifugal pumps were installed outside the down stream cofferdam, and the water was pumped out of the remaining space. Cofferdams were also built across the canal on either side of the works, to take care of any water that might accumulate in the canal basin. As already mentioned, the canal was 60 miles long between locks, so that quite a large amount of water was expected to accumulate through drainage, etc.

Just as soon as the intervening space (which hereafter we will term the "Hole") was pumped out, the work of tearing out the arch above it, and one half of the middle wall, was proceeded with. Dynamite was used to great advantage on this operation. After all the débris had been cleared out, and the space straightened up, the pile driver was lowered down and the work of driving the foundation and sheet piles for the eastern buttress wall and middle wall started. Fig. 2 shows the pile driver at work in the hole. At first sight this appears a fairly simple set of operations, but I would like to point out the series of troubles and mishaps that occurred ere the pile driving was completed. First, the old stonework was all laid on the then usual foundation of large timbers, simply hewn on the four sides and placed in the form of a cribwork. At the bottom, timbers, approximately 14ins. by 14ins. and from 30 to 35 ft. long, were laid lengthways with the river. On top of these, shorter lengths were laid at right angles to the first layer. Then again another row of the long ones was laid parallel with the first. All were spaced out 6 inches apart. On account of this cribwork effect, the difficulty of keeping the hole free from water can be imagined.

Secondly, just as the last row of piles was being driven, preparatory to concreting, a heavy thaw set in, with a downpour of rain, the result being that the river flooded. Like all mountain rivers, it rose at a tremendous rate, and in less than six hours the water was rushing over the top of the up stream cofferdam. Soon afterwards the dam went out, as also the down stream one. The water still continued to rise till it was finally pouring over the top of the old arch on the up stream end. Fig. 3 shows this condition of affairs very clearly.

In Fig. 4 the hole can be seen full of water, and the pile driver immersed, except the smoke stack. This is interesting when compared with Fig. 2, which shows the hole before the flood. Among other troubles the ice in the river broke up and dammed across the arches, and had to be dynamited to prevent serious floods further up the river.

At this time another mishap took place, which proved to be by far the greatest setback the engineers experienced. The Mohawk River, which flows quite close to the canal, about ten miles west of the work, rose to an unprecedented height through the thaw and rain. As a result it flooded its banks and poured over into the canal. The tremendous rush of water proved too much for the coffer-dam near the work, which, of course, had never been designed for such a condition. Consequently this dam went out, and the water poured down over the existing arch into the hole, as can be seen in Fig. 5. This arch, already weakened by the removal of the eastern one, soon collapsed under the great weight of the water, at the same time pushing over the remaining half of the middle wall. Thus, not only was the middle wall, which served as a dam on one side of the hole, broken down, but the entire site for the new work was covered with large stones averaging about 5ft. long, two feet wide, and a foot thick, under about 12ft. of water. After a good many schemes had been proposed, it was finally decided to clear a space right along the line of the old middle wall, divers being employed for this work. After this space was cleared, a long coffer-dam was erected in place of the old wall. This was made of two rows of 7ft. sheet piles secured to 6ins. by 6ins. cross timbers, the two sides being spaced about 2ft. 6ins. apart. The dam was made in sections, and then lowered into the water, and sunk by means of large stones. When all the sections had been set in place and bolted together, the space between the two sides was filled with clay and well puddled. After this the coffer-dams were rebuilt, on the two ends of the arch and in the canal, and the hole pumped out once more.*

Altogether six weeks were entirely wasted so far as any progress on the new work was concerned, owing to the hole being inundated, and the time occupied in rebuilding the dams.

The pile driver did not appear to have suffered much as the result of its six weeks' immersion, and after a few light repairs was soon put into commission again. The piling was all finally completed for the eastern arch and middle wall, and the concrete slab put in for the river bed when passing under the aqueduct. This was about 2ft. thick and

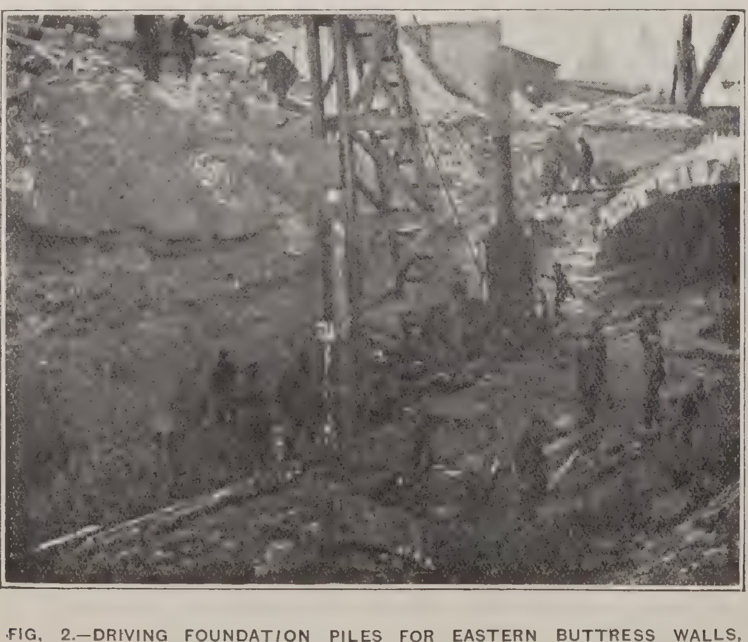

FIG. 2.—DRIVING FOUNDATION PILES FOR EASTERN BUTTRESS WALLS.

---

*A second flood occurred soon after the centre coffer dam had been completed, which overturned it, and washed out practically all the clay which had been puddled into it.

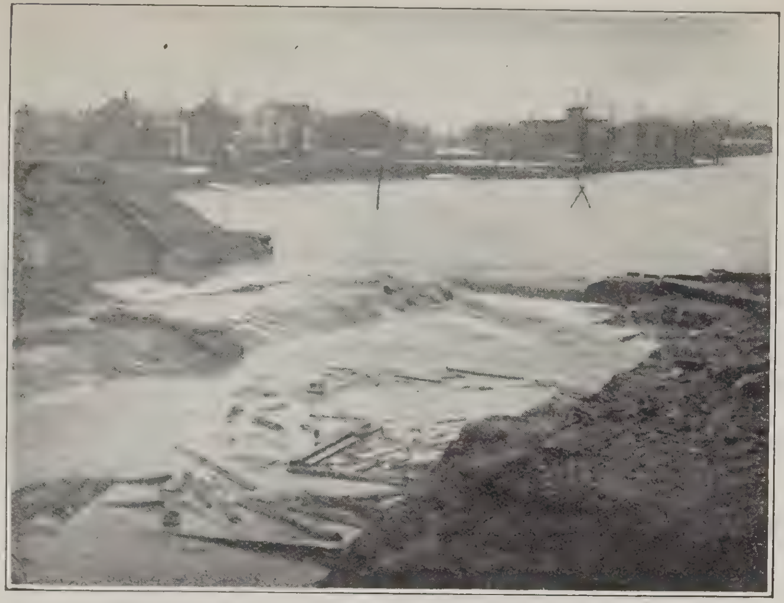

FIG. 3.—WORKS SUBMERGED DURING FLOOD OF RIVER.

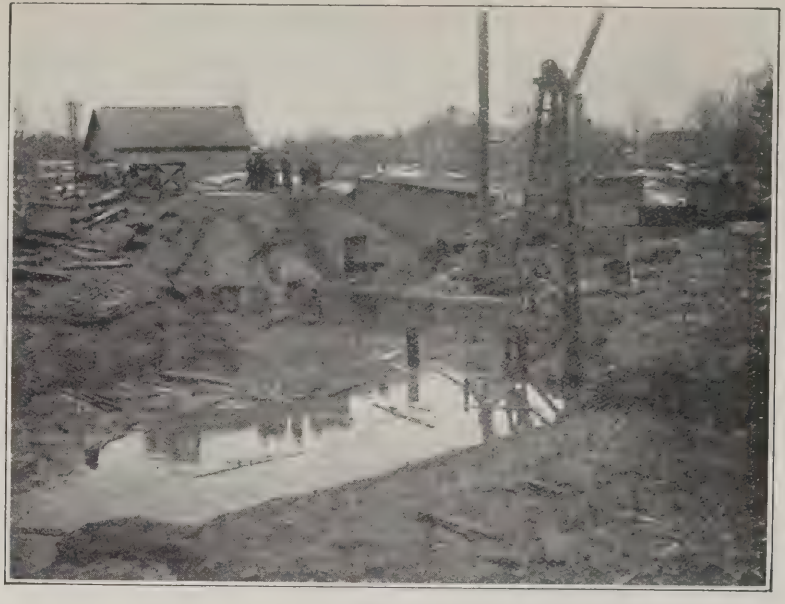

FIG. 4.—"HOLE" FULL OF WATER, SHOWING PILE DRIVER—IMMERSED TO SMOKE STACK.

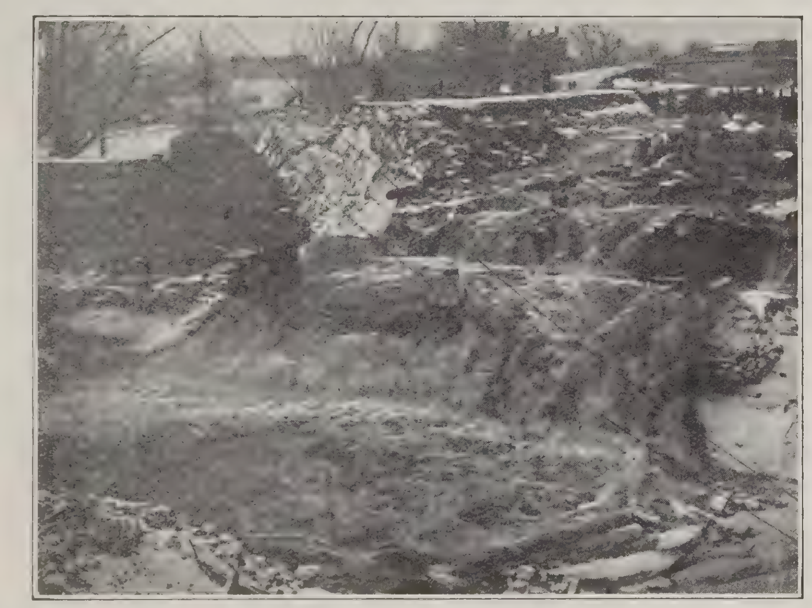

FIG. 5.—WATER RUSHING OVER WESTERN ARCH AFTER CANAL COFFER DAM HAD GIVEN WAY.

A REINFORCED CONCRETE AQUEDUCT.

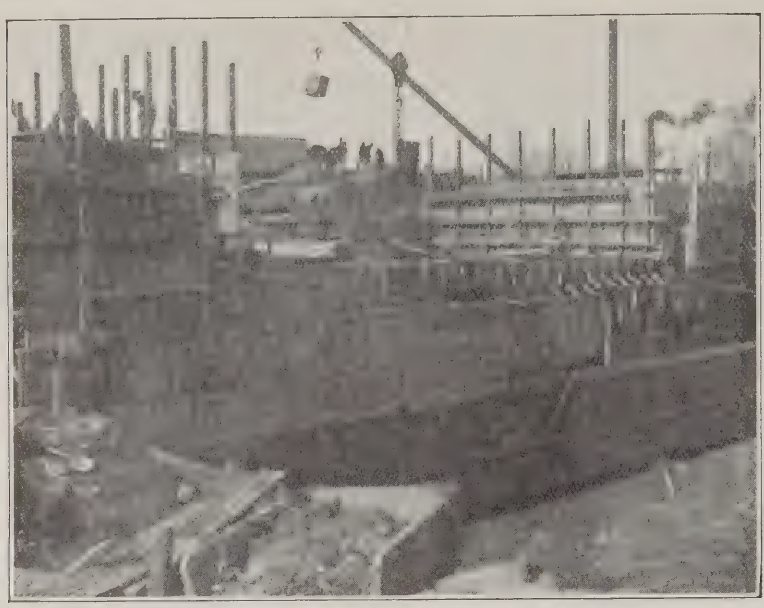

FIG. 7.—MIDDLE WALL COMPLETED, AND FORMS FOR CANAL SIDE WALLS IN POSITION.

reinforced with 1in. steel rods placed at right angles to the stream and spaced 12ins. apart. The next step was the erection of the forms for the buttress wall, wing walls, and middle wall. Figs. 6 and 7 give a good idea of the works at this stage.

The forms for the buttress and middle walls were made in the form of separate interchangeable panels, so that they could be used over again on the western arch. All these had been made up while the tearing down of the old work was proceeding, and stacked away, so as to be ready when required.

The panels were made up of 2in. matched plank dressed on one side, 8ins. wide, and about 10ft. long, as shown in Fig. 8. It will be needless to describe them in detail, as the figure clearly shows their construction.

The process of erecting the panels consisted in fixing the bottom row by stay lasts, and then placing another row on top, so placed that the joints in each row coincided. Long 6in. by 6in. timbers were then placed vertically at the joints, just fitting into the spaces left between the short 6ins. by 6ins., owing to the 3in. projections at the ends of the panels. Other rows were added in like fashion to suit the height of the wall. Outside the vertical 6in. by 6in. timbers, horizontal 6in. by 6in. were placed about 2ft. 6ins. apart. This set of operations was done on both sides of the proposed wall. Iron rods, 5-8ths inch diameter, threaded at both ends and fitted with nuts, were then passed through the horizontal 6in. by 6in., spaced about 4ft. apart, and so arranged as to clear all the vertical timbers, merely passing through the 2in. planking. Spacing pieces of 2ins. by 4ins. cut to the required width of the wall, were fitted inside the forms quite close to the bars, and the nuts screwed down so as to draw the two sides of the forms tight on the spacing pieces. When the forms were being filled, the 2in. by 4in. were knocked out as the concrete reached them. After the forms were removed the projecting ends of the iron rods were cut off with shears, and a little cement put over the ends. This method of holding the forms proved very successful, as not the slightest bulging occurred, despite the fact that the middle wall was 4ft. thick, and was filled to a depth of 8ft. to 10ft. at a time.

While these forms were being filled, work was started on the supports for carrying the forms for the canal bottom, which consisted of concrete beams and a 12in. slab above, monolithic with them.

These forms were made in the shape of troughs of the required length and dimensions for the concrete beams. The ends were cut off on a slight taper to facilitate matters when removing them. All these troughs were made early in the work, so as to be ready to put in place when required.

The supports were made of 6in. by 6in. timbers, and five legs were equally spaced across the width of the arch. Each leg was clamped to a common 6in. by 6in. cap piece. After all the sets of supports had been fixed up, they were levelled and spaced out with centres corresponding to the centres of the I beams. Then the troughs were lowered right on to them, and firmly secured to one another by pieces of 2ins. by 4ins., as shown at xx in Figure 9. At the two ends of the arch the supports were doubled to take care of the extra weight of the side walls of the canal. As soon as all the supports had been braced up, and secured in such a way that they would not be moved by the current of the river when turned through, the two coffer-dams were pulled out and the river let through. The dams were then rebuilt across the space between the new middle wall and the old western buttress wall. The pumps were moved across, and the water pumped out, thus enabling the pile drivers to be set up, and the piling driven for this part of the new work.

(To be concluded.)

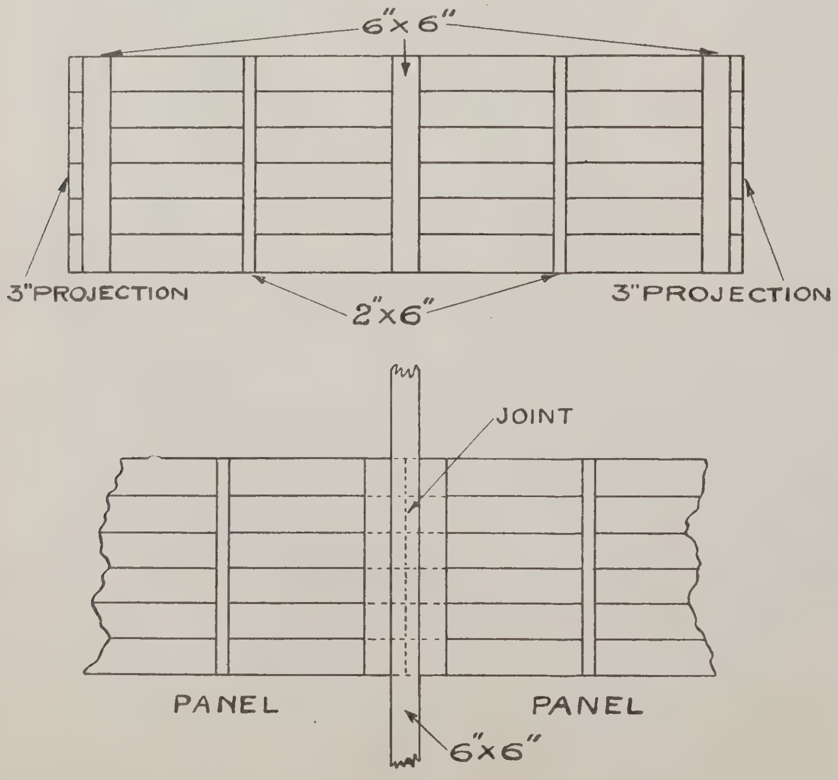

FIG. 8.—PANEL CONSTRUCTION OF FORMS FOR WALLS.

MONOLITHIC CONSTRUCTION AND METHODS OF CALCULATING STRESSES.

(Concluded from page 11, No. 726.)

The moment of resistance in a reinforced concrete beam in practice varies considerably across the width, because of the natural practical differences of proportioning the amount of reinforcement to the bending moment at each point. But it does not pay as a general rule to go into the calculations of beams too closely, and even if we did, we should probably be just as much at sea, because the theory is hardly sufficiently accurate as yet, and it must ever be approximate.

A test, therefore, to be of value to practical constructors, should be of a practical character. The conditions should certainly be carefully determined in a laboratory manner, but the lessons to be learnt from such tests will be of most service to the practical designer. At present the designer works upon abstract statical theory, from which many important factors have been eliminated. We require full size tests under actual conditions to show how fully the latter conform to the theory. We shall by such means obtain facts for the deduction of abstract theoretical determinations, and we may, at the same time, learn a good deal about the manner in which we should reinforce beams adjoining and over the supports, and, perhaps, learn how to effect economies.

The shear stresses in such monolithic construction become very intricate of analysis, and it perhaps hardly repays investigation in the present stage; it would be far better first to have experimental data to work upon, as we should get a better clue to the points that require investigation, and should save labour in working.

There are also other points that require elucidation by means of experiment, such as the effect of inequality in the heights of the supports due to the inexactitude of practice, and the variation in quality of materials. An alteration in the heights of supports in steel-

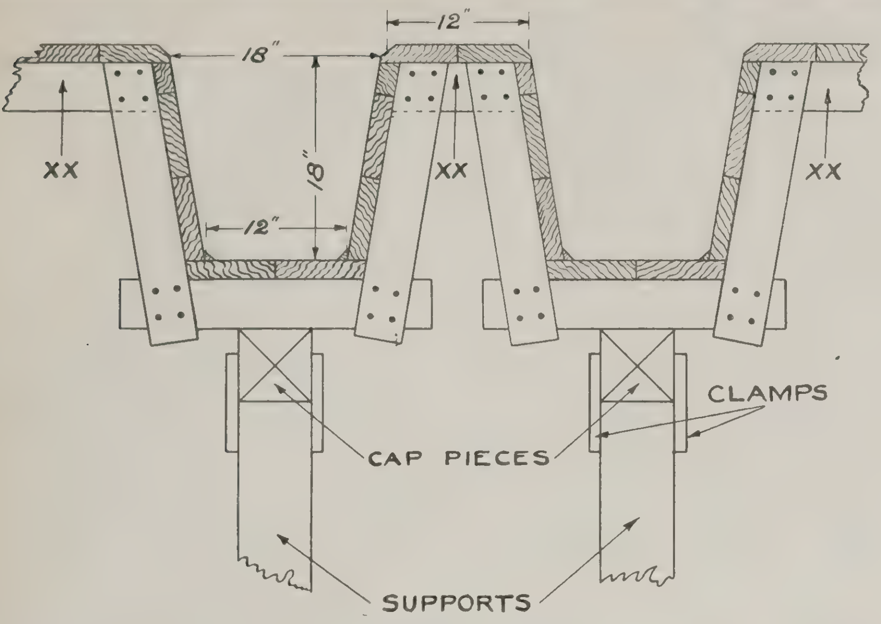

FIG. 9.—A REINFORCED CONCRETE AQUEDUCT: SECTION OF FORMS FOR BEAMS IN CANAL BOTTOM.

work design has often been shown to theoretically greatly affect the bending moment, and throw stresses upon continuous beams that will much exceed those assumed in designing for the supports to be level. Consequently, unless we are content to have a very large factor of safety or disregard the safety of a structure, we are forced to take special precautions to ensure the conditions of theory being carried into practice. If such conditions apply with steelwork, may they not apply equally stringently to reinforced concrete? On the other hand, the nature of reinforced concrete in itself may be such as to reduce the deleterious effect of such variations in the height of the supports —we rather think its does, for reinforced concrete, when it is being cast, will adapt itself to minor inequalities, and, at the same time, possesses considerable ductility and flexibility, though the latter quality is possessed probably by steel in a greater degree. Yet there is one feature that off-sets these good points, namely, the frequent want of rigidity in the centering; this, if it can be proved to be an element of danger, can be overcome by the provision of stronger and more rigid centering, but, in the want of experimental data, we do not know whether any precautions of this character are required.

Of course, a point that constantly arises, and will occur to the minds of most, perhaps, at this point of the argument, or before, is the question of the great risk of inaccuracy in the disposal of the reinforcement due to incompetent and negligent workmanship, but this can be overcome by taking special precautions, and every year will effect improvement in this direction, for the workmen in the employment of specialists, and even the building trade generally, are becoming more and more familiar with reinforced concrete as a system of construction, while, at the same time, there are various methods which may be adopted to guard against such errors and neglect. This aspect does not really directly affect the subject under discussion, which is the determination of the conditions that are present in a continuous monolithic reinforced concrete construction.

There is a great need for experimental investigation. We have above dealt only with beams, but we have before referred to the inadequate experimental investigation into the strength of floor slabs. Particularly is this inadequacy seen with floor slabs more or less fixed at the supports, and especially on all four edges. How much of the floor slab may be taken as acting as the table of a T beam, and how much constitutes the intermediate portion suspended therefrom, as also, how much stress we may throw into the table of the T beam, and the variation of stresses existing therein, are all points arising out of this subject, that require close and patient investigation.

The fact is we are all very much in the dark. Practical designers have learnt a great deal from the results of failures, and from the results obtained in their own practice, but the information they have been able to gain in this way is very meagre. Fortunately, the large factor of safety that is usually adopted covers up many inaccuracies and much ignorance. The specialist designer, as a rule, exercises a good deal of common sense in the matter. He recognises the futility of elaborate calculations, and even if we were to be provided to-morrow with a very full and elaborate analysis of all the conditions appertaining to reinforced concrete in all its many forms, and the exact effect of various methods of designing and executing the work recorded, we should still be subject to the inequalities of workmanship and materials which render it necessary to maintain a fairly high factor of safety and render elaborate calculation needless and wasteful. Our calculations should be effected readily, but not roughly, but to conduct them only fairly accurately calls for considerable experimental investigation in order to provide us with the necessary information upon which to base either simple or elaborate theories and methods of calculation.

Before the Surveyors' Institution, on January 25th, Colonel Sir Duncan Alexander Johnston, K.C.M.G., read a paper on the Ordnance Survey, of which he was till recently director-general. The work has been in progress since 1784. No other country has a general survey on so large a scale, and it is being continually revised, as the face of the country is constantly altering from artificial and natural causes. New roads and buildings are made, enclosures are sub-divided or altered, new railways are constructed, the coast line and rivers alter, and in time the maps cease to represent the country as it exists. The Treasury therefore sanctioned in 1886 a revision of the 1 in 2,500 scale maps every twenty years, but this revision could not be commenced till 1894. In Great Britain the original survey was completed towards the end of the last century, and the work of the Ordnance Survey is now that of periodical revision of the maps. The extent of the undertaking may be judged from the fact that the Ordnance Survey publishes between 90,000 and 100,000 different maps.

TAKING OUT WEIGHTS IN IRONWORK.

By A. E. Fletcher.

The following rules, which are not to be found in the usual pocket-books, have been collected in the course of some years' experience, and have been found exceedingly useful. They are approximations, of course, but sufficiently near to be trustworthy for practical use, and the amount of time saved in hunting up tables of weights and areas, etc., is ample repayment for the slight trouble entailed in memorising them. In most cases they are slightly above the theoretical weights given in tables, which is rather an advantage, since commercial sections are generally rather full than otherwise in dimensions. The source of each rule is given where known to the writer, but the name mentioned may possibly not be in some cases that of the originator, as some of the rules have been used by ironmasters for many years.

Weight of Mild Steel Plate and Bars.

These generally being rolled a trifle full.
Per foot super. 1in. thick=42lbs.
Per foot super. $\frac{1}{2}$in. thick=21lbs.
or at the rate of $5\frac{1}{8}$lbs. per ft. super. for every $\frac{1}{8}$in. in thickness.

Flat Bars.

Find the area in sq. ins., multiply by 10, and divide by 3 = weight in lbs. per ft. run.

Note.—This rule being rather bare for mild steel, it is best to add 1-40th to the result.

Examples.

4 by $\frac{3}{8}$ wrought iron $= 1.5 = \frac{15.0}{3} = 5$ lbs. per ft.

8 by $\frac{1}{2}$ steel $= 4 = \frac{40}{3} = 13.3$

Add $\frac{1}{40}$ $\quad$ $\underline{\quad .3}$
13.6

Say, $13\frac{3}{4}$lbs. per ft. run.

Round Mild Steel Bars.

Bring diameter to $\frac{1}{8}$in., square this, and divide by 23. Result—weight in lbs. per ft.

Example.

1 in. $= \frac{8 \text{ by } 8}{23} = 2{\cdot}8$ lbs. per ft. (nearly)

or square the diameter, multiply by 27, and strike off the last figure for a decimal place.

Example.

2in. $= 4$ by $27 = 108 = 10.8$lbs. per ft.

The second rule is the easier when the diameter is an even number of inches.

Mild Steel Angle and Tee Sections.

Add the widths of flanges in inches, multiply by the number of 32nds in thickness, and strike off the last figure for a decimal place.

Example.

4 by 4 by $\frac{3}{8}$ L.
4 + 4=8 by 12 thirty-seconds thick,
=96, or 9.6lbs. per ft.
(J. J. Fletcher.)

Weight of Cast-Iron Columns.

These are troublesome to take out, even with the help of a table of areas of circles, but by the following rule are easily and quickly arrived at:—

Multiply the mean diameter (*i.e.*, the outside diameter minus one thickness) by the number of eighths in the thickness. Divide this successively by 5, 6 and 7, and add the whole together. This is the weight of shaft in lbs. per ft. run. This rule is very exact.

Example.

Say, column 6in. diameter and ½in. thick.

Mean diameter
= 6ins. = ½in. = 5½.
4 No. of eighths thick.

Divide	5	22
	6	4.4
by	7	.7
		.1
		27.2 lbs. per ft.

For base, cap and stiffeners bring all to cubic inches, divide by 4, and add ⅛. This allows for the rounding in the angles.

The above very useful rule was worked out by Charles Hoare, whose labours are not much remembered now, but who was one of the pioneers of the use of the slide rule and the inventor of the duodecimally-divided slide rule for the use of contractors. Although foreign to these notes, this digression may be pardoned in favour of the memory of a man who did a great amount of good work in his time, and whom some readers may possibly remember.

THE GOVERNMENT'S OUTPUT IN PUBLIC WORKS.

According to a valuable publication, "The Government's Record, 1906-1908," which has just been issued from the headquarters of the Liberal party, the total voted expenditure controlled this year by the Office of Works is £1,792,100. It is stated that the buildings for the extension of the National Gallery are making progress. An important improvement is found to be practicable which will reduce still more the risk of fire. All boilers for heating, etc., will be removed from the National Gallery and also from the adjacent National Portrait Gallery, and heat and electric power will be obtained from a station in the Orange Street Waterworks, which are Government property, on the opposite side of the street. Economy in working will result as well as safety. The remainder of the establishment at St. George's Barracks and the recruiting station are to be removed from the back of the National Gallery to Old Scotland Yard, thus reducing the risks of fire and affording space for further enlargement. Through the generosity of the late Sir J. J. Duveen, an extension of the British Art Gallery has been arranged, to be carried out at his expense. The enlargement and improvement of the Scottish Law Courts is in progress, as also the building of the Duke of York's School near Dover, and the new Admiralty extension at Spring Gardens, and many other important buildings. The British Museum extension is in hand, and the estimated cost is £200,000. In the last three years the following buildings have been completed:—The new Royal College of Science at Kensington (£320,000); the third block of new Admiralty Buildings in St. James's Park, completing the scheme begun in 1895 (land and buildings, £1,000,000); the new Post Office at Aberdeen (£55,000); the new magnetic observatory for the Royal Society at Eskdale Muir (£20,000); the new Embassy House at Madrid (£52,000).

The programme for new buildings or for the enlargement of existing buildings includes some 50 separate and important works in progress, and the following are noted, with the estimated cost:—

G.P.O., King Edward VII.'s Building, £316,000.
Blackfriars Power Station, £49,265.
Western District new P.O., £69,000.
Birmingham new Telegraph Stores, £85,000.
Bristol Head P.O. Enlargement, £40,810.
Hull new P.O., £58,000.
Manchester Newton Street new sorting office and branch P.O., £66,800.
Sheffield new P.O., £53,500.
Edinburgh P.O. Extension, £62,000.

With regard to the Ancient Monuments Acts, 1882 and 1900, it is stated that the guardianship of certain additional monuments included in the schedule to the Act of 1882 has been accepted by the Commissioners of Works. The Commissioners are in communication with the proprietors of other historic buildings and prehistoric remains with the view of taking charge thereof under the provisions of the Acts. Increased care is given to historic buildings such as Edinburgh Castle, where large sums are being spent to ensure protection against fire and better sanitary conditions for the occupants. Stirling Castle, Walmer Castle, and generally the castles taken over from the War Department as being no longer required for military purposes are carefully inspected and preserved. Private owners and antiquarian societies appear to recognise now that the Commissioners of Works are the only public body having legal powers to preserve such monuments, and an organised and trained staff is distributed over the country which can continuously carry on the work of supervision and reparation. The weakness of the position, it is pointed out, is that the Acts give no power to the Government (unlike other civilised Governments) to prevent the destruction or defacement of a monument which has not been placed under the Act. Under the National Galleries of Scotland Act, 1906, the buildings in Edinburgh known as the Royal Institution, the National Gallery, and the National Portrait Gallery, and Dunblane Cathedral, formerly vested in the Board of Manufacturers, have been transferred to the keeping of Mr. Harcourt as First Commissioner of Works. Among the numerous other matters dealt with in the report are the alterations in the House of Commons, where the ventilation improvements have now been brought practically to a conclusion. The internal stonework of that building has been further cleaned of paint and dirt, and new frescoes are to be added to the corridors. Mr. Harcourt has directed that the following fair wages clause shall be included in the building, engineering, and so far as practicable in all other contracts of the Works Department:—"The wages paid by the contractor to workmen employed by him on the execution of works shall be those generally accepted in each trade for competent workmen in the district where they are employed, and the contractors' wages books and time sheets for all workmen, so far as they relate to this contract, shall be open to the inspection of the Commissioners of Works or their representatives at such times as they may think fit."

REINFORCED CONCRETE SYSTEMS.

The Chain Concrete System.

(*Concluded from page 18, No. 726.*)

The illustration at bottom of page 19 in our issue of January 6th shows view of work in course of construction, namely, the erection of a carding factory at Cleckheaton, in Yorkshire, for Messrs. Critchley, Sharp, and Tetlow, of which Messrs. Howarth and Howarth, of Old Bank Chambers, Cleckheaton, are the architects. A complete view of the work in progress, the arrangement of the clips in the column reinforcement, and method of centering which the firm adopts are clearly shown. The trestles are thoroughly braced, and the folding wedges will be noted which lower the beam box, dropping it a few inches so as to ascertain if there is any deflection before striking the whole of the centering. The work of construction in the erection of this factory was carried out very speedily. In one particular case a derrick was placed on the floor and used only ten days after construction, when the forms had been removed. The roof of this building is used as a large tank, the length of which is 190ft., and the width 55ft. The capacity of the tank is 85,000 gallons. In addition there is a condensing plant weighing 7½ tons, erected on the roof. On p. 199 of our issue for December 30th, we gave an interior view of the same factory, showing the wide spans which are permitted in reinforced concrete without great depth of the beams. Such a factory is ideal for the cotton industry, for not only is the fire risk greatly reduced—the method of construction being one of the most fire-resisting known—but it is cleanly, and not subject to deterioration by the corrosion of the steelwork, etc. The cost of upkeep in a building of this

Chain Concrete Construction.

FLOOR OF SCHOOL IN COURSE OF CONSTRUCTION AT CASTLEFORD.

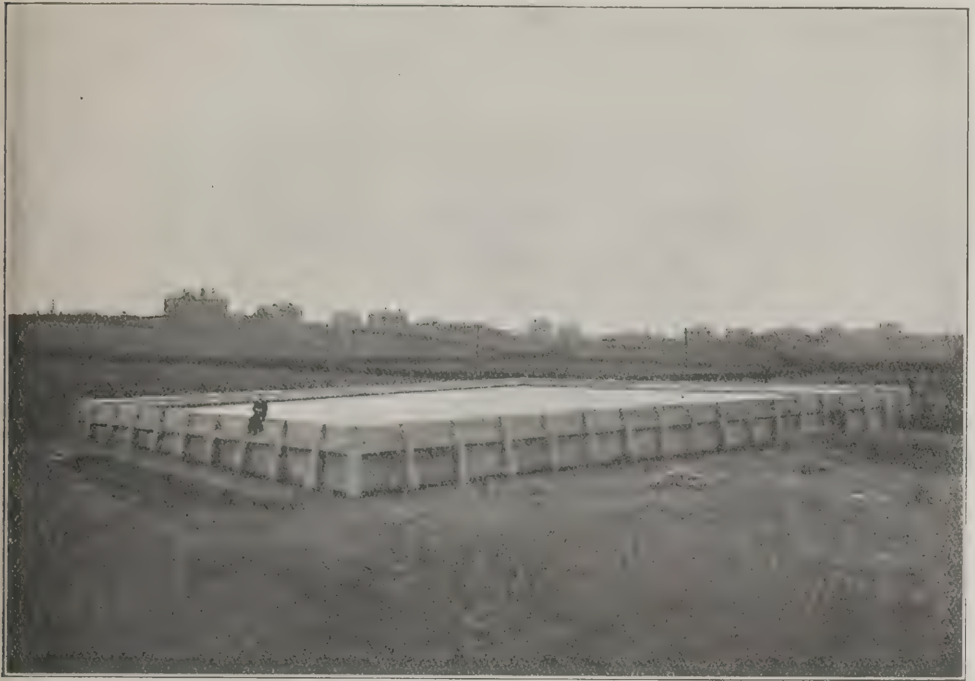

FIG. 7.—STORAGE RESERVOIR, PUDSEY, YORKSHIRE. CHAIN CONCRETE REINFORCEMENT. JOWETT KENDALL AND SON, ENGINEERS.

nature is extremely small, and the saving on this score alone must be very great in a building of this character compared with ordinary steel-frame construction.

The floors of the Cleckheaton factory are 3½ins. thick, finished with cokebreeze concrete for nailing boards. Through the building there is only one line of columns. In the basement these are 16ins. square, for the next two floors 14ins. square, and those to carry the roof are 11ins. square. The main beams running across the building have a span of 27ft. 3ins. from wall to column; they are 17ins. deep by 11ins. wide, while the secondary beams, which are arranged in three lines down the building, namely, one in the centre, and the others two on each side in the centre of the bays, are 11ins. deep by 7ins. wide. The columns are at 10ft. 6ins. centres. The distributed load of the tank is about 300 tons.

One important point in connection with reinforced concrete construction, namely, the freedom from vibration, has been given emphasis in this building. In a cotton factory, practically the whole is given over to machinery of an intricate and highly delicate character. Vibration in such circumstances is a serious consideration, and a steel frame structure has generally the disadvantage that it is subject to great vibration. It is very interesting to note that in this building, owing to the non-existence of vibration, the machines have been speeded ten per cent. higher than when working on wooden floors. The total area of the floors and flat roof in this factory is about 5,000 square yards.

Fig. 7 shows the storage reservoir, which has been constructed at Pudsey in Yorkshire. The walls, it will be seen, are only 8ins. thick, and they stand 9ft. above the ground level. The capacity of the reservoir is 500,000 gallons. It was constructed for Messrs. W. C. Forrest and Co., Prospect Mill, Pudsey, the engineers being **Messrs. Jowett Kendall** and Son, of South Parade, Pudsey. The construction is clearly shown by the photograph, and the working drawing (Fig. 8), showing that it consists of a wall 8ins. thick between buttresses, with a beam between near the top to stiffen the structure. The arrangement of the reinforcement, together with the patent clips is clearly shown on the drawing. The reservoir is faced with 1 cement to 1 sand ½in. thick.

As regards the general methods of calculations favoured by the Chain Concrete Syndicate, this is the ordinary customary theory which may be described as conforming generally to the recommendations of the Committee on reinforced concrete, appointed by the Royal Institute of British Architects.

Fig. 9 shows a view of steel Chain reinforcement for a bank strong-room at Leeds, carried out under the instructions of the architects, Messrs. Carby, Hall and Dalby, of Park Row, Leeds. The illustration shows the spacing of the bars and the rigid fixing of same by the special clips. The walls will be 10ins. thick when finished, with double steel-work.

The firm prepare their own designs for construction and execute the whole of the work themselves, which they claim is not only a responsible method of working, but as the patent rights are their property, no royalty has to be paid to the patentees, and that economy therefore is obtained. A great deal of work has been carried out in Yorkshire, and we give below a list of some of the more important works:—Cover to reservoir, Kirkireton Water Works, near Derby; retort house floors, at Wath-upon-Dearne Gas Works, near Rotherham; retort house floors, at Castleford Gas Works, Yorks; retort house floors, at Knottingley Gas Works, Yorks; foundations to chimney stack, The Mount Brick Works, Glass Houghton, Yorks; drill shed at Welbeck Street Schools, Castleford; floors, corridors and beams, Glass Houghton Schools; floors and flat roofs, Normanton Police Station; floors, etc., to piano warehouse, Castleford; floors, etc., Normanton Joint Hospital, Featherstone; floors and flat roofs, 5,000 yards sup., Carding Factory, Cleckheaton; floors and flat roofs, Heckmondwike; floors and flat roofs, Heap Riding Mill, Stockport; floors and balconies, Clay Pit Lane Barracks, Leeds; roofs, etc., to extensions, Beechwood, Roundhay, Leeds; floors to school buildings, Heaton, Bradford; storage reservoir, Prospect Mill, Pudsey; foundations for oil tank, near Rotherham; floors, corridors and roofs, Secondary School, Castleford; floors, etc., Millshaw Leather Works, Churwell, near Leeds; floors and roofs, Deanfield Mill, Morley; floors to drying room, Clifton Mills, Bailiffe Bridge; floors and girders to residence, Shadwell, near Leeds; and roof to concert hall, Church Street, Castleford.

London's shortest street, it is claimed in a recent newspaper correspondence, is Hammet Street, Minories, E.C., which is 80ft. long, and contains only two houses, one on each side.

* * *

The Factory Department of the Home Office, it is understood, will be shortly transferred to the Board of Trade. The proposed transfer has been the subject of several departmental conferences, in which the weight of evidence in favour of the change has been acknowledged. The work of factory inspection is so closely associated with the operations in which the Labour Department of the Board of Trade has been engaged in recent years, that the transfer may be regarded as of the character of a natural development, and it may be expected to lead to many economies in administration, which are likely to have the further advantage of increased efficiency. The transference would, of course, occupy some little time in its completion.

Patent Act: Reprisals in France.—In view of the restrictions which have been imposed or are contemplated in other countries, upon the exercise of patents, the French Government proposes to amend the law of July 5th, 1844, which enacts that failure to exercise patent rights shall entail lapse of the patent. In the interests of French industry and commerce, a Bill has accordingly been drawn up which provides for an amendment of paragraph 32 of the law of 1844 in the following sense:—Patent rights shall be held to lapse in the event of failure on the part of the holder either to exercise his rights in France or in the French colonies for a period of three years after applying for his certificate, or to resume exercise after a similar interval, or secondly, in the event of only partial exercise of the patent in French territory. In the second event the Patent Courts will be invested with discretionary powers to call upon the holder of the patent to show cause why he should not exercise his rights in French territory "in an adequate degree." These provisions will be held to cover designs and models as well as discoveries and inventions, and their force will be retrospective.

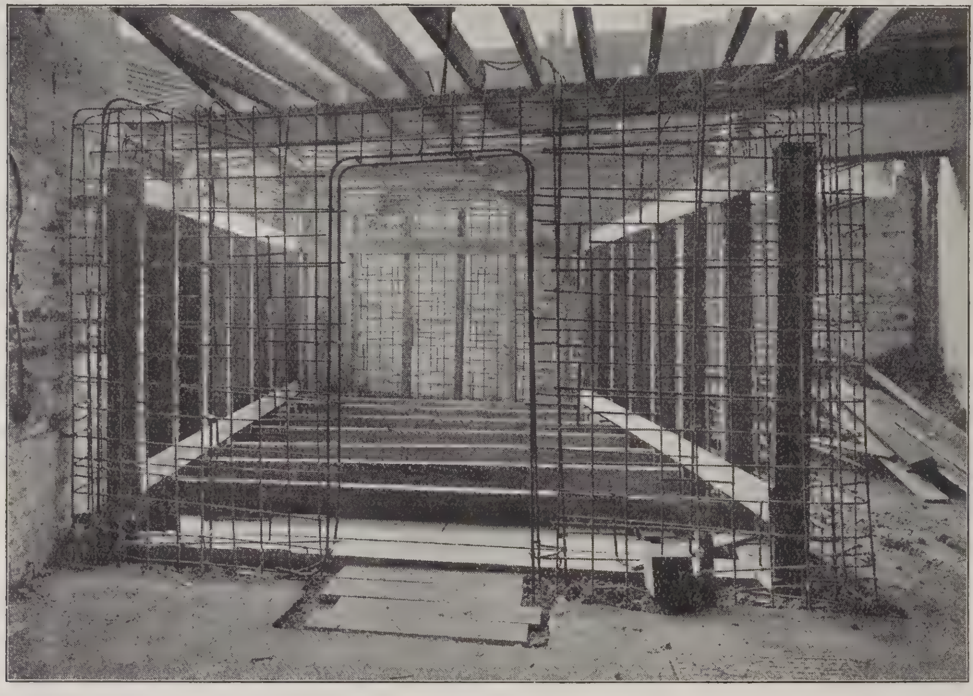

FIG. 9.—BANK STRONG ROOM IN LEEDS. SHOWING CHAIN CONCRETE REINFORCEMENT BEFORE THE CONCRETE WAS PLACED IN POSITION. CARBY, HALL AND DALBY, ARCHITECTS. (*See previous page*).

REINFORCED CONCRETE IN FOUNDATIONS.

By Vere Sussex Hyde.

Of the various forms of modern building, reinforced concrete may be styled the most versatile. It can, with success, be adapted to almost any kind of structure, and perhaps it may be shown to one of its best advantages in the construction of foundations, on particularly awkward and dangerous sites.

In a case where it would be necessary to construct very deep and wide foundations of the usual type, the use of reinforcement in concrete, by placing bars near the bottom surfaces, will considerably reduce the thickness of ordinary footings; consequently, on a very bad site, if reinforced concrete is used entirely, great economy may be exercised, and, apart from that, a reliable foundation can be built in a degree of certainty that would be lacking if it were built in the ordinary way.

Treatment of Marshy Sites.

Taking, for instance, a very marshy site, or a site that consists of made-up ground of, say, 20 ft. deep over the whole area on which it is proposed to erect a building. It will be found that a foundation constructed on the principle of a huge raft supported on reinforced concrete piles is most successful. By this method it is possible to distribute loads safely over the whole area. A fine example of this means of construction is nearing completion at the new Generating Station, Dundee, which has been carried out on the Coignet system. The accompanying photographs give an excellent idea of the method employed.

In building a foundation of this type, the piles are driven in groups according to the manner detailed on the plans and specification. When a sufficient number of piles have been driven, the work of building the raft can be commenced. The first thing that is done is to strip the heads of the piles down to the necessary levels, leaving the rods bare. Blocks or caps are formed in falsework, generally termed centering, around the heads of the groups of piles; then moulds for the principal beam and secondary beams are erected. The necessary reinforcement is placed in the cap and beam moulds. These are concreted, and thus whole beams, piles, and caps are made monolithic. The ground is then made up to the level of the underside of the slab. The reinforcement or armouring is laid and connected in the same manner as an ordinary floor slab. (See Fig. 1.)

Foundations for Heavy Loads.

For foundations subjected to heavy and vibrating loads, such as engines for electrical plant and for engine beds, blocks may be constructed in a similar fashion to those already referred to, supported on piles.

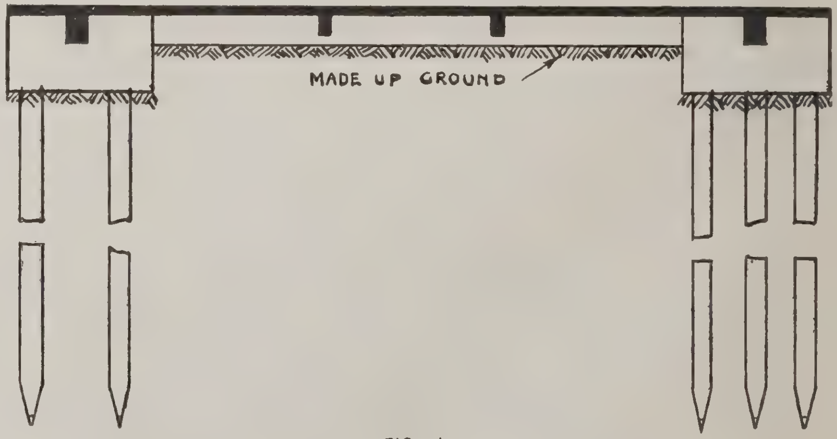

FIG. 1.

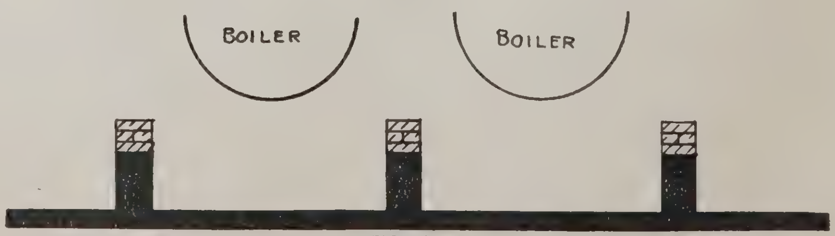

FIG. 2.

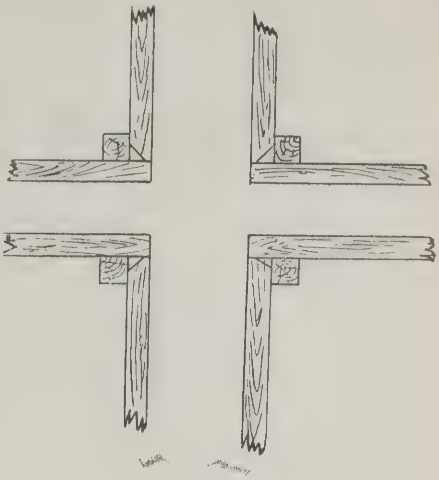
View showing block to support chimney shaft.

ILLUSTRATING "REINFORCED CONCRETE IN FOUNDATIONS."



PLAN

FIG. 5.

A very interesting example of the adaptability of armoured concrete for sustaining heavy loads may be found at Messrs. J. C. and J. Field and Son's new candle and soap factory at Rainham, in Essex. The work is the foundation for boilers on very marshy ground. It was constructed as an ordinary floor slab on beams, but inverted. By this means the reaction of the ground is withstood, and corresponds to an ordinary superload, spread over the whole area. (See Fig. 2.)

Footings for Posts and Walls.

Footings for posts and walls are sometimes erected on the ground if sufficiently sound, but in a bad case, on piles. Figs. 3 and 4 illustrate two types of footings as advocated by two well-known systems; they sufficiently explain themselves, so it will not be necessary to give a detailed description of them.

Economy in the Falsework.

There is a good opportunity for an ingenious foreman to exercise considerable economy in the falsework, shuttering, or centering in foundation work. The ground can be made up and levelled to the under side of the beams and slabs, and so save placing bottom planking. This is an item of great consideration in an ordinary floor. No props are required, and other necessary means of support, unavoidable in floors or slabs above the ground level. Care must be exercised so that all beams are straight, rigid, and in their proper positions, and should be strutted from one another, so that they do not bulge during the process of concreting.

So that the beam moulds may be easily removed, it will be found a good practice to splay the ends of the sides of the moulds where they meet, as shown in Fig. 5.

A new road bridge, connecting the Berw side of the Toll river with the Cilfynydd side, has just been constructed of reinforced concrete on the Hennebique system, at a cost of £3,500 for the Pontypridd Urban District Council. It is the largest span bridge built of this material in Great Britain. The total length is about 170ft., with a uniform width of 30ft., and the main arch is 120ft. long. The two piers are carried on reinforced concrete pile foundations, driven to the rock, and the whole work has taken just over six months to complete. A few days ago the bridge was tested with a weight of nearly 40 tons. The centre deflected to the extent of from ⅛in. to 1-10in., and resumed its normal position immediately the weight was removed. The bridge was designed by Mr. P. R. A. Willoughby, surveyor to the Pontypridd Urban District Council (who has just accepted the position of Commissioner of Works for the Government of Jamaica), and the contract was placed with Messrs. Page and Co., Cardiff.

REPORTS ON TESTS AT BIRMINGHAM NEW TELEGRAPH STORES.

Ground Floor, Block "B."—Normal load, 3 cwts. per foot super; full load 4½ cwts per foot super; area tested 324 ft.; thickness of slab, 4 in.; clear span of beams, 23 ft. October 31st, 7 a.m., deflection indicator set, loading commenced. 5 p.m. same day, load of 24 tons 6 cwts. (1½ cwts. per ft. super) on, deflection 2/64th in. Load left on until November 2nd 6 a.m., then doubled—3 cwts. per ft., or total load of 48 tons 12 cwts. This load was on by 11.30 a.m., deflection 5/64th in. Doubled load remained on until 12.30 p.m., then further 1½ cwts. per ft. (24 tons 6 cwts.) added and on by 2.30 p.m., deflection 10/64th in., under full load of 4½ cwts. per ft. super. This load remained until Tuesday morning, November 3rd, no further deflection taking place. Load gradually taken off and normal position regained by 5 o'clock.

Second Floor, Block "B."—Normal load 2 cwts. per ft. super.; full load, 3 cwts. per ft. super.; area tested, 324 ft.; thickness of slab, 4½ in.; clear span of beams, 23 ft. November 2nd, 7 a.m., deflection indicator set, loading commenced, 11.15 a.m. same day normal load on, deflection under beam 13/128th in. Load left on until 12.30 p.m. same day, and additional 1 cwt. per ft. added, 3 cwts. on by 2.30 p.m. same day, deflection 13/64th in. 2.40 same day load removed, floor immediately commenced to regain normal position—reached by 4 p.m., there still being load of two tons on floor. Both floors examined afterwards, no sign of any cracks, etc., whatever.

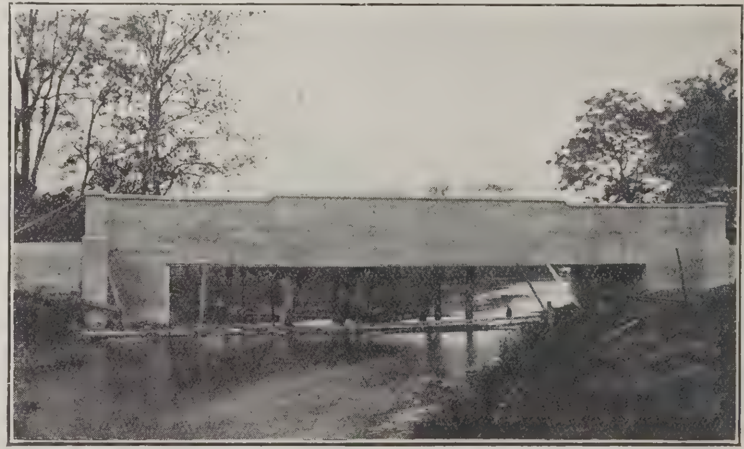
Reinforced concrete work carried out by Cubitt Concrete Construction Company. Reinforcement, Kahn Trussed Bars. Building consists of four floors and roof, and is 202 ft. 7 in. long, 65 ft. wide at greatest width, and 60 ft. high. Ground floor designed for superimposed load of 336 lbs. per ft. super. First and second floors 224 lbs. per ft. super. Decking of ground floor, 5½ in. and 4⅜ in. thick. Main beams, 23 ft. clear span, 24 in. total depth. Entire skeleton of building, viz., columns, beams, decking, etc., erected in reinforced concrete. Facing of brick and stonework carried at each floor level on reinforced concrete beams. Wall practically erected in panels and entirely carried by framework. Walls do not carry any of floor loads.

Note.—This building is a replica of Block "A" constructed by this company, only designed to carry lighter loads.

The test was carried out on November 2nd, 1908.

The general designs are by Mr. J. Rutherford, H.M. Office of Works.

A REINFORCED CONCRETE BRIDGE IN KENT.



REINFORCED CONCRETE BRIDGE OVER THE RIVER STOUR AT CHILHAM, KENT.

Messrs. D. G. Somerville and Co., the well-known specialists in reinforced concrete, have just completed for the East Ashford Urban District a reinforced concrete bridge.

This bridge, of which an illustration is shown, spans the River Stour at Chilham: the span which for a flat girder type is considerable, is 47ft. in the clear, the width of roadway being 15ft. The abutments, which also form retaining walls, are carried down to a solid bottom 10ft. below the surface of the roadway. The main girders are carried up to form the side parapets, and are finished with an ornamental moulded coping. The roadway is carried on a 5in. thick reinforced concrete deck supported on intermediate beams.

The bridge was successfully tested a few days ago in the presence of Mr. H. P. Maybury, the county surveyor, the test consisting of two 12-ton traction engines connected together and run over at five miles an hour. A feature of the construction was the rapidity with which Messrs. D. G. Somerville and Co. carried out the work, only taking six working days from time of completing the necessary excavation for the foundations, the system of reinforcing being that of the Kahn bar.

In order to facilitate the working of the Patents Act, the London Chamber of Commerce is arranging the formation of a central committee or association.

* * *

A miniature rifle range has been constructed on the roof of the new Victoria Railway Station Buildings, Manchester, by the Lancashire and Yorkshire Railway Company, for the use of their employees.

Notes and News.

The sale of Queen's Road (Bayswater) baths and washhouse, and the site they cover, by Paddington Borough Council has been negotiated, Messrs. William Whiteley, Ltd., having agreed to purchase for £60,000, provided the consent of the Local Government Board can be obtained.

* * *

By a Bill now being promoted by the London County Council, it is proposed to spend £1,090,000 for the extension of tramways in London. The Bill deals with the construction of new lines in Paddington, Clerkenwell, Finsbury, Shoreditch, Islington, Hackney, Battersea, Putney, Wandsworth, Deptford, Greenwich, Woolwich, and Highgate, and includes provisions for the purchase of the Highgate Hill Tramways. Of the amount proposed to be expended, £638,500 is for the construction and equipment of new tramways, the reconstruction of existing tramways, and the purchase of land; while £451,000 is set apart for new streets, street improvements, widenings work, and land purchase. The Shoreditch Borough Council has petitioned against the Bill, which will be considered on February 17th.

* * *

The site of the Franco-British Exhibition at Shepherd's Bush is to be utilised this year for an Imperial International Exhibition, which will open in May. The exhibition will be run on the same lines as last year, but will be open to the products of all countries. The old palaces, re-decorated, will be available for housing the exhibits.

* * *

Lockwood's Price Book.—The term "Price Book" has been long considerably outgrown, and "Lockwood" contains not only every building-trade item to which a price can be attached, but also many other features that do not admit of this qualification for inclusion—such as, for example, the lists of surveyors, the notes on legal decisions, the full texts of several Acts of Parliament affecting buildings, and a number of useful tables and other memoranda. The volume is, in fact, a builders' year-book, as complete and comprehensive as could be desired. The editor, Mr. Francis T. W. Miller, A.R.I.B.A., has been, as usual, assisted in the legal department by Mr. A. J. David, LL.M. Messrs. Crosby, Lockwood and Son, 7, Stationers' Hall Court, Ludgate Hill, E.C., and 121a, Victoria Street, Westminster, are the publishers, and the price is 4s.

* * *

A silver and ebony altar cross has been placed in Croyland Abbey, to the late Rector of Croyland, the Rev. T. H. Le Bœuf, who had a fatal seizure whilst conducting service in the abbey. The altar cross bears the inscription round the base: "To God and His Church, in memory of Thomas Henry Le Bœuf, priest, and sometime rector of Croyland. R.I.P." The late rector did a very important work in connection with the restoration of the famous abbey, and wrote some thousands of letters, which resulted in a large sum being realised and expended in the restoration of the fabric.

A "skyscraper church," or combination church and business building, has been designed for Pittsburg, Mass., by Mr. Eugene C. F. Ernst. The building is to consist of three 80-ft. sections. The two outside sections will contain shops and offices, while the middle section will contain the church, with more offices above. An assembly hall, 240ft. by 110ft., will be found on the fourteenth floor. A clock with a 10-ft. face, will be placed on the sixth storey, and above it there will be set of chimes. The estimated cost is £400,000.

* * *

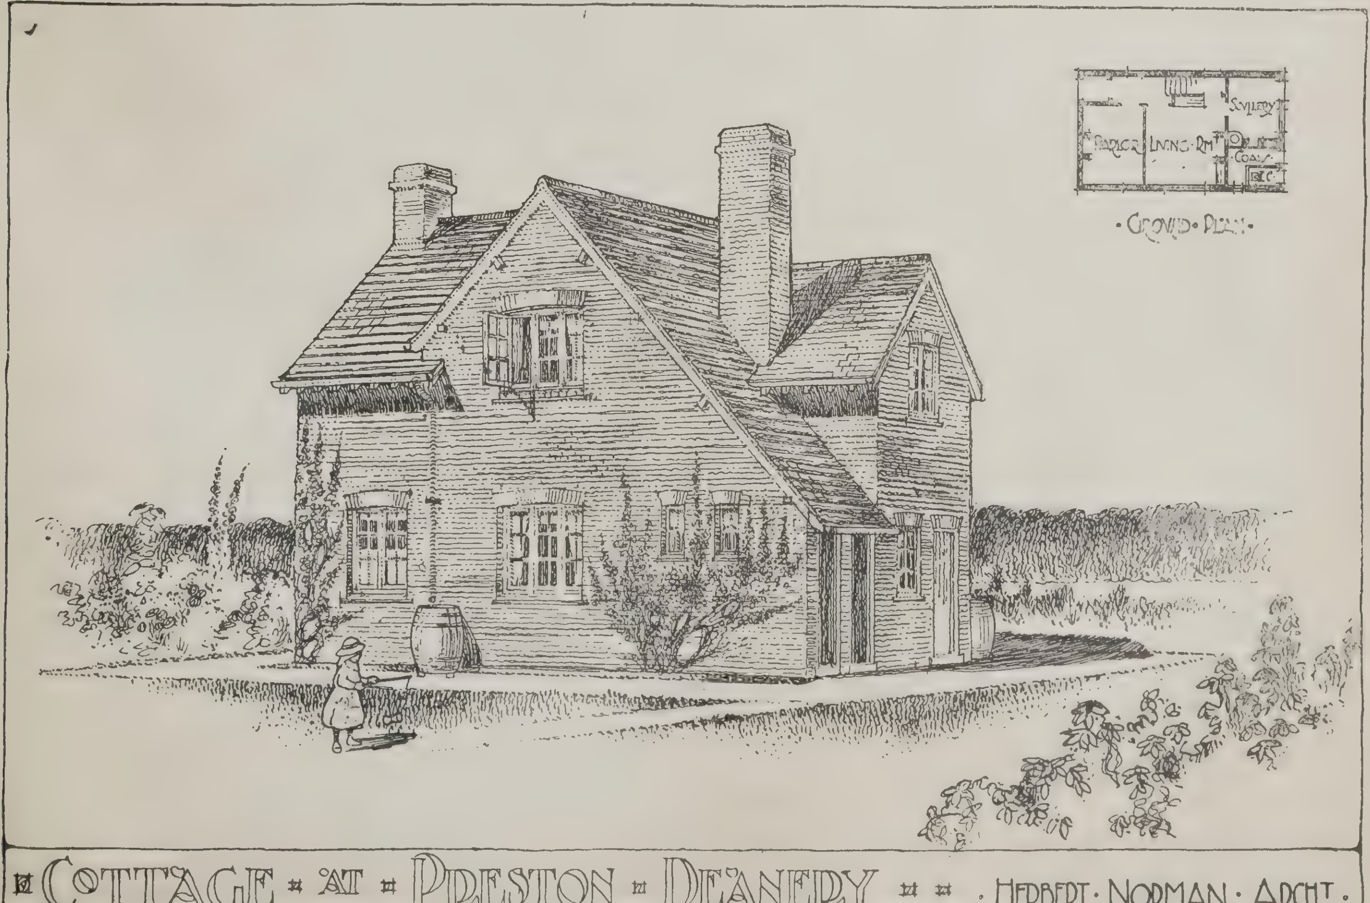
The directors of the First Garden City, Limited, in their report for the past year, state that four new factories and several workshops have been established, or sites have been taken for them, and 134 new buildings have been erected or commenced. A sum of £18,987 has been expended on capital account during the past year, and a further sum of £10,000 could very advantageously be applied forthwith, and further capital before the end of the year.

* * *

The members of the Shakespeare Memorial Executive Committee met on Thursday evening, at the Mansion House, under the presidency of the Lord Mayor. The reports of the two sub-committees appointed to examine the proposal for a national theatre and a scheme for making a public appeal for funds were considered and approved. Some other matters in regard to the movement were adjourned. The scheme for the erection of a national theatre as a Shakespeare Memorial is, therefore, approved, but the proposal will come up for final consideration at a future meeting of the general body.

* * *

The Borough engineer of Camberwell, in his report on the recent snowfall, remarks that it was the heaviest experienced in the borough for twenty-eight years. The total expenditure incurred there in the clearance of snow was £2,492. The previous fall, in 1906-7, cost the ratepayers £1,931. The Council is responsible for 117½ miles of roads, with 235 miles of footways. The engineer is of opinion that no better facilities for disposal of snow are available in Camberwell than the sewers afford, provided a sufficient supply of water is running therein to secure that the loads of snow when shot are swept away immediately by the current. This was the first occasion that snow had been treated in this way, and the experiment has resulted in a saving of time, labour, and "barging." Each sewer has since been examined, but no evidence of injurious effects was found. The Works Committee has passed a resolution expressing appreciation of the efficient manner in which the Borough engineer and his staff dealt with the emergency.



COTTAGE AT PRESTON DEANERY. HERBERT NORMAN, ARCHT.

This cottage is built with local-made bricks and has a slate roof, the object being to get, at a low figure, a pleasing grouping by means of the broken roof and chimneys. The builder was Mr. Henry Martin.

The beautification of Cardiff is going on. Lord Tredegar's agent having been approached with respect to the development of land on the Penylan side of the Cardiff railway, it was intimated that Lord Tredegar was willing that the streets should be 70ft. wide instead of 50ft., if the corporation would agree to 10ft. on each side being reserved for the planting of trees and shrubs. The committee agreed to the proposal, which they thought very generous, as well as conducive to the health and beauty of the locality.

* * *

A subway for the Elephant and Castle, Southwark, was advocated at a public meeting at which the Mayor presided. It was explained that the idea originated with a Bill promoted by the Baker Street and Waterloo Railway Company, who proposed to construct a station near there. The company had, however, after obtaining the powers, found it undesirable to construct that station, and had paid the borough council £6,000 towards the cost of constructing the subway. In the London County Council Bill the estimated cost of the work was £17,000. Towards that expenditure the borough council had in hand £6,086, and a further £3,000 would be contributed by the London County Council. The balance would have to be made up by loan. The resolution in favour of the project was carried unanimously. The town clerk of Southwark explained that the three subways would run:—(1) From the southern corner of St. George's Road to the eastern side of Newington Causeway; (2) from the eastern side of Newington Butts to the western side of Newington Causeway; (3) from the northern side of St. George's Road, and effecting a junction underground with the second section. The entrance in all cases will be on the footway principle.

* * *

At the annual meeting of the Garden City Association, which was held at Birkbeck Bank Chambers, London, on January 27th, Mr. Justice Neville, the president, claimed that the association had brought about a great change in the minds of the public in regard to the laying out of estates, and generally with regard to the housing of the working classes. As the result of their teaching, he declared, tenants were more exigent about the amount of space required in the rooms of their houses, and builders no longer attempted to put off upon the public the kind of buildings that used to be thought good enough. Mr. Edward Moon mentioned the suburb schemes at Warrington and Bristol, the village being formed on Holderness Road, Hull, largely through the endeavours of Sir James Reckitt, for the benefit of the employees at Messrs. Reckitt's works, and the model mining village of Woodlands, near Doncaster, where the Brodsworth Colliery Company had made an advance over anything hitherto attempted. More villages on similar lines were being projected by colliery owners in various parts. Dr. R. O. Moon submitted the balance-sheet, which showed a deficit of £150, the subscriptions for the year having fallen off by £60. Mr. Justice Neville was re-elected president.

* * *

The County Councils Association has decided to hold in London on April 29th and two following days a conference on roads. Among the public bodies which have already appointed delegates are many English, Scotch, and Irish county councils, the Association of Municipal Corporations, the Urban and Rural District Councils Association, the Convention of Royal Burghs, the Association of Municipal and County Engineers, the County Surveyors' Association, the Institution of Municipal Engineers, the Institution of Mechanical Engineers, the Central Chambers of Agriculture, the Royal Automobile Club, the Scottish Automobile Club, the Yorkshire Automobile Club, the Roads Improvement Association, and the Motor Union. The delegates appointed include the Marquis of Winchester, the Marquis of Breadalbane, the Marquis of Bute, Lord Valentia, Lord Montagu of Beaulieu, Sir W. H. Browne-Ffolkes, Sir W. Chance, Colonel C. Crompton, Admiral Hart-Dyke, Mr. C. D. Rose, M.P., and a large number of county and borough surveyors.

* * *

The excavations during the past year at the site of the Roman city of Corstopitum (Corbridge-on-Tyne) are described in the annual report of the Newcastle Society of Antiquaries, in which it is stated that the results more than realised anticipations of the nature and character of this buried city. This centre disclosed in the granaries, and in the massive masonry adjacent, a series of buildings in keeping with the magnitude of a large town. A piece of folded lead was discovered, which, on being opened, was found to contain a gold ring and forty-eight gold coins. These ranged in date from the reign of Valentinian (A.D. 364 to 375) to that of Magnus Maximus (A.D. 383 to 388). Many detached Roman camps were observed, which suggested new problems in relation to the successive military operations during the subjugation of these parts by the legionaries.

Law Case.

Storage Reservoir a Building.

In the very useful digest of law cases that is published weekly in the "Standard," the following case is summarised: "A covered storage reservoir, with concrete floor and walls of brickwork, backed by concrete and earth, covered in by brick arches supported by piers, the arches being covered with concrete and earth, and of a cubical extent exceeding the statutory maximum of a building structure under the London Building Act, 1894, is a building within the Act, and is subject to its provisions, including the supervision of the district surveyor, notwithstanding that it has been constructed under the powers of special Acts of Parliament. So held on January 19th by the Divisional Court in a case stated by a metropolitan police magistrate. "Venner v. McDonell" ([1897] 1 Q.B., 421); "London County Council v. City and South London Railway Company" ([1891] 2 Q.B., 531); "Surrey Commercial Dock v. Bermondsey Borough" (73 L.J., K.B., 293; [1904] 1 K.B., 474) distinguished.—MORAN AND SON v. MARSLAND.

Correspondence.

A Rod of Brickwork.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—A correspondent in "Notes and Queries" for Nov. 14th last asked—When the rod, which he assumed to be a land measure, was first used for brickwork? and the following week, in the BUILDERS' JOURNAL, the retort courteous was made that possibly things might be reversed, and the question put—When was the rod as a brick measure adapted to land?

Referring to this, a correspondent makes the following interesting observations:—

"The origin of the rod, pole, or perch as a lineal and superficial measure has been traced to the rod, pole, or goad used to urge and direct a team of oxen pulling a plough. So it came about it was used as a convenient and handy land measure in feudal times by the lords in allotting plots of land for agricultural purposes to the villans and others. One rod wide and forty long (i.e., one "furrow-long" deep) built up a quarter of an acre. The furlong—or four poles wide, and the same depth, i.e., 40 poles, one acre—was a convenient length for a furrow before turning the plough. Of course, these lengths somewhat varied in different parts of the country where soils and agriculture varied, but gradually the slight variations grew less, and finally the present accepted statutory acre was evolved. Gunter's chain of 66 ft. (ten square chains to the acre) was invented by the Rev. Edmund Gunter (1581-1626). He was a professor of astronomy at Gresham College, London, and ingenuously adapted it to facilitate decimal calculations in land measurements.

"The use of the rod—in superficial measurements of brickwork—and lineally in hedges, ditches, and fences, followed as a convenient existing measure. A square rod is 272¼ superficial feet. There was an old Winchester corn gallon (enacted in 1712) of 272¼ cubic inches, but this was not derived from the superficial rod. The old Winchester bushel was 2,150.42 cubic inches—omit the fraction, add one Winchester wine pint—said to have been added as an allowance for waste in grinding—28 cubic inches (also omitting fractions), and we get 2,178 cubic inches—divide by eight for gallons, and 272¼ is the result."

An old authority gives the length of the original rod—the ox-goad—as varying from 16ft. to 20ft.

From the above it would appear the rod was originally a land measure.—Yours truly,

Exeter. HARRY HEMS.

Obituary.

The death is announced of Mr. Robert Henry Boyce, of Hampton Wick, late Principal Surveyor in his Majesty's Office of Works. Mr. Boyce was born in February, 1834, and received a scientific education, on the completion of which he entered the Civil Branch of the Royal Engineers. A few years later he was selected to proceed to China in connection with the fortification of various British settlements. This occupied him for some years, and he was then appointed to design and superintend the erection of various Diplomatic and Consular buildings in the East. He afterwards joined the Office of Works, from which he retired some seven years ago. In recognition of his services he received the Companionship of Bath. Just before his retirement Mr. Boyce built at Hampton Wick a house which was in many ways a remarkable type of architecture, combining many of the features which its owner had noted during his travels, and was so constructed that even extreme variations of external temperature scarcely affected its inhabitants.

Mr. James Neale, F.R.I.B.A., F.S.A., who died on January 18th, at 10, Bloomsbury Square, W.C., in his fifty-ninth year, was the architect of many residences in Hampstead and elsewhere. He also laid out the New Malden Station Estate, in Surrey. He was the author of an excellent architectural monograph on St. Albans. He was the R.I.B.A. Pugin Student in 1875, and Institute Medallist (Drawings) in 1876. He was elected Associate in 1875, and Fellow in 1890.

Mr. Walter Hill.—The death occurred at Hever, Edenbridge, Kent, on Sunday evening, January 17th, of Mr. Walter Hill, of Peterborough, one of the members of the firm of John Thompson and Co., church builders and restorers. Mr. Hill, who was in his 61st year, had for more than forty years taken a great part in cathedral and other restoration work in all parts of the kingdom; the new tower and spire of the American church in Paris was also built under his direction. He first became associated with the late Mr. John Thompson in 1865. He took part in the erection of the Royal College of Music, the Church House at Westminster, and the Royal Holloway College, Egham, and also superintended the additions to the King's and Queen's apartments at Sandringham. He was also employed in the restoration of Canterbury, Hereford, Ripon, Chester, Salisbury, Llandaff, Winchester, Peterborough, Lichfield, Lincoln, Rochester, and Bangor Cathedrals. At the death of Mr. John Thompson he became a partner in the firm.

Architectural Societies.

Glasgow Institute of Architects.

The triennial competition, open to Britain, for the Alexander Thomson Memorial Studentship, value £60, under the management of the Council of the Glasgow Institute of Architects, as trustees, has this year resulted in favour of Mr. David Robertson, a second prize of £20 being awarded to Mr. Alexander Thomson Scott. The object of the contest is to select a student for furtherance of his studies by giving him acquaintance at first hand with Classical architecture, of which the late Mr. Thomson, in whose memory the studentship is instituted, was a warm admirer, and practised very successfully, as many Glasgow works testify. Drawings are required from the competitors as evidence of study in books, and from buildings by sketch and measurement, and besides these an original design is required: the subject this time being a city church with halls and manse. Five sets were submitted, and of four the standard reached is stated to be higher than on any previous occasion, especially in the matter of excellent draughtsmanship. The winner is in the office of Messrs. Stewart and Paterson, and the second prizeman is with Messrs. Campbell Douglas and A. N. Paterson, and both are students of the Glasgow School of Architecture, another of whose students, Mr. R. W. M. Gunn (as reported in our issue of January 20th) gained the R.I.B.A. "Tite" prize for architectural design.

Leeds and Yorkshire Architectural Society.

Mr. H. Phillips Fletcher, F.R.I.B.A., in the course of a paper on "Georgian Domestic Architecture," read before the Leeds and Yorkshire Architectural Society on January 14th, explained that Georgian architecture the style principally in vogue in the 18th century, was the English expression of the great Renaissance movement. He traced the influence of Inigo Jones, and the effects of his visits to Italy in the middle of the 17th century. He also pointed out how Wren nurtured the style with his borrowings from the architecture of the Netherlands, producing buildings so peculiar to this period. The lecturer attributed the decay of Georgian work to the age of the succession of revivals, and pointed out its reintroduction some twenty years ago under the name of Queen Anne. A house in the close at Salisbury was taken as typical of the smaller house, and the well-proportioned sash windows and stout wooden bars were noted, the most prominent feature being, perhaps, the central doorway, with its consoles and the boldly projecting consoled cornice. The lecturer then analysed the characteristic features of the style, and remarked that Wren popularized red brick walls; although in suitable districts stone was much employed. The Swan House in Chichester was quoted as a good example of rubbed brickwork with the employment of raised blocks at the angles. A doorway at West Wycombe was taken as being a simple and satisfactory example in which fluted pilasters and a simple cornice were used. It was pointed out that the doorways of the period were finely executed in wood, and formed a strong contrast to the Italian marble doorways of the same period. The doorway at Mr. Seymour Lucas's house, with its typical shell hood, was also shown on the screen. The windows of the sash type set flush with the wall were taken as being typical of the style, and it was noted that such windows were considerably smaller than those of the Jacobean period. The introduction of external shutters from Italy was also borne in mind, and their effect upon the scale and appearance of the buildings was also considered. It was pointed out that the cornices projected boldly and formed special features, and it was also shown that they were frequently of wood, and often carried right round the house. The method of roofing was then dealt with, and that at Tyttenhanger, Herts, was taken as being characteristic. The effect of its reposeful skyline, and the dignity and unity of design, were contrasted with the numerous gables so frequent in many modern houses. The feature that Georgian architects made of chimney stacks, and their symmetrical grouping, was also dwelt upon.

The lecturer then dealt with the treatment of internal work. Commencing with the walls, he pointed out the frequent division of the same into three—namely, the low dado, the large panel, and the cornice which gave a certain breadth to the whole, which was sometimes wanting in Jacobean work. The framing of the doorway in one of the classical orders was also noticed. Examples of the rich treatment of the fireplaces were also placed upon the screen.

The lecturer also decribed the bold and effective Georgian staircases, and the geometrical treatment of the ceilings.

Mr. Fletcher then dealt with the grouping of smaller houses together, which produced such fine designs, and took the terraced houses at Stamford as characteristic of the style. He then showed an example of another house in Salisbury Close, showing the plain simple treatment for a detached town house.

Eltham House, Kent, was treated as a good example of the simple block plan for a country house, and Groombridge Place, Kent, was shown with its H-shaped plan.

Houses having a centre block with wings were then dealt with, and many slides of Stoke Park, Northants; Blenheim Palace, and other buildings, were shown upon the screen. The town mansion was then dealt with, and Marlborough House, London, and Kensington Palace were shown.

In conclusion, Mr. Fletcher pointed out the appropriateness of the different buildings to their special requirements, and the homely comfort of the smaller buildings contrasting with the stateliness and grandeur of the large buildings. He also noted the tendency in certain directions towards simplicity in design at the present time, and hoped that the study of Georgian architecture would assist in this direction. He specially pointed out that the *motif* of much of the Georgian work was suitable for houses of the present day. He thought that the successful results of the period were due to a very large extent to the very extensive and diverse attainments of so many of the Georgian architects which gave them the facility for grasping at once the measures that in each individual case would be appropriate. He considered that the versatility and refinement in Georgian design was due largely to liberal education of the architects, who did not confine themselves to the study of their profession alone, but of whom many were, in addition, skilled mathematicians, astronomers, dramatists, and even, so it is rumoured, not indifferent performers with the rapier. The lecturer thanked his brother, Mr. Banister Fletcher, for having placed his collection of slides at his disposal, and he mentioned that this collection contains more than 7,000 slides, a very large number of which were made from photographs specially taken in various parts of the world by Mr. Banister Fletcher.

Sheffield Society of Architects.

At the monthly meeting of the Sheffield Society of Architects and Surveyors, held at the University, Mr. J. R. Wigfull, A.R.I.B.A., described a visit paid to Rouen, Caudibec, and St. Wandrille. He gave a graphic description of the magnificent cathedral at Rouen, and also had a few words to say about the various parish churches of the city, including those of St. Ouen and St. Maclou. Afterwards he took his audience to the picturesque little town of Caudibec, where there is a fine church of the 15th century, containing a tablet to the master mason, who, for 30 years. directed the work The church and the quaint streets of the town were spoken of, and, in conclusion, Mr. Wigfull dealt with the Abbey of St. Wandrille, mentioning its connection in early times with the churches of Sheffield and Ecclesfield. The great tithes of Sheffield went to the monks of St. Wandrille, and Ecclesfield was a priory of the Abbey until the time of Richard II., when the alien priories were confiscated. The lecture was illustrated by slides made from photographs taken by Mr. Wigfull. At the close there was a discussion in which the President, Mr. Gibbs, Mr. Hall, and Mr. Mitchell-Withers took part.

Architectural Association.

At the ordinary general meeting, held on January 22nd, it was announced that the following gentlemen were unanimously elected:—E. L. Apperly, Lancaster Gate, W.; O. Newbold, Beckenham; H. Boyd-Walker, Rosario, Argentina; C. J. Newberry, Adelphi,, W.C.; B. H. B. Symons-Jeune, Henley-on-Thames; T. H. Chalkley, Bermondsey, S.E.; A. C. Newman, Chiswick, W. ; J. B. L. Tolhurst, Beckenham, Kent; A. Thorpe, Hampstead, N.W.

Views and Reviews.

Calendars, Year Books, and Diaries.

It is not yet too late to notice a batch of annual publications, the receipt of which, from want of space, we have been hitherto prevented from acknowledging. A "tear-off" wall calendar from Messrs. Arthur L. Gibson and Company, 19-21, Tower Street, Upper St. Martin's Lane, W.C., is adorned with a very fine three-colour reproduction of E. Lamasure's painting, "A Country Road." "The Mill on the Floss," by A. Malcolm, an excellent "Rotary Photo" reproduction, adorns the wall calendar sent out by Messrs. W. Hall and Co., mahogany and timber merchants, of Hackney Road, N.E., and Rye Lane, Peckham, S.E. "The Year's Art, 1909," edited by Mr. A. C. R. Carter, and published by Hutchinson and Co., 34, Paternoster Row, is the thirtieth annual issue of a publication that not only reviews the past year's art (architecture being, of course, included), but describes succinctly the principal art institutions at home and abroad, and includes a valuable directory of artists and art workers. "The Mechanical World Pocket Diary and Year Book for 1909" (Emmott and Company, Ltd., 65, King Street, Manchester) contains a collection of useful engineering notes, rules, tables, and data, and is, without flattery, a wonderful sixpennyworth. The "Diary and Handbook of the London Master Builders' Association" (2s. 6d.: 31 and 32, Bedford Street, Strand) contains in handy form a great deal of information that is indispensable to building-trade employers, and that cannot be easily obtained elsewhere—such, for instance, as the list of members of the London Master Builders' Association, the "short history" of the association, and the summary of working rule agreements with the operatives. "Willing's Press Guide" (1s.: James Willing, jun., Ltd., 125, Strand, London, W.C.) is a concise and handy alphabetical list of the newspapers and periodicals issued in the United Kingdom, with the year of establishment, when published, price, and publisher's name and address, different classes of periodicals being conveniently indicated by distinctive type. The "Sanitary Record Year Book and Diary for 1909" (5, Fetter Lane, E.C.) has for its principal feature an excellent diary, interleaved with blotting paper, but it contains also a variety of useful information on sanitary matters, with a useful review of the sanitary legislation of 1908. The "Decorators' Diary and Trade Year Book, 1909," edited by Arthur Seymour Jennings (The Trade Papers Publishing Co., Ltd., 365, Birkbeck Bank Chambers, High Holborn, W.C.), includes an excellent interleaved diary, many valuable tables, and, for the first time, a "List of Prices for Painters' and Decorators' Work," for which it is claimed that it is the most complete list of the kind extant.

Federation News.

LEEDS ASSOCIATION.

Secretary: J. Davidson.

The monthly meeting of the Leeds Association was held on January 12th, Mr. W. Irwin, president, in the chair. The president reported that the Highways Surveyor of the Leeds Corporation had intimated his willingness to fall in with the views of the Association that the payment of paving repairs should be based on measurement and not by time, the alteration to take place from January 1st, 1909.

A letter was received from the Buildere' Labourers alleging breach of working rules with respect to wages paid on a Corporation contract. As a result of considerable correspondence, information was ultimately divulged which showed that the matter had been the subject of previous correspondence between the operatives' society and the Corporation. It was ascertained that the town clerk had written to the society intimating that the Corporation Committee, after carefully considering the matter, had arrived at a decision that there was no breach of the Corporation's fair trade clause requirements. The members expressed themselves very strongly on the procedure adopted by the operatives of taking any dispute direct to the Corporation without first bringing it under the notice of the association. Ultimately a resolution was passed to the effect that the operatives having appealed to the Leeds Corporation, the members felt that they ought to be satisfied with the decision of the Corporation committee.

The president and Messrs. P. Rhodes and J. S. Myers were elected as representatives to the National General Meetings, with Mr. G. W. Wilson as reserve. Five firms were elected as the associate members of the association. Two small accounts were presented for consideration, and passed for payment.

NEWPORT (MON.) ASSOCIATION.

Secretary: R. Richards.

The annual meeting of the Newport (Mon.) Association was held on Monday, January 11th, Mr. A. W. Brownscombe, president, in the chair. After the usual business of the association had been dealt with, the election of officers for 1909 took place, the new president elected being Mr. W. Jewell, of the firm of Messrs. W. Jewell and Son, contractors; vice-president, Mr. John Charles, contractor, of the Shaftesbury Steam Joinery Works. Councillor Wm. Blackburn is re-elected hon. treasurer, Mr. George Martin and Mr. D. Nicholas are re-elected auditors, and Mr. Richard Richards was re-elected secretary for the ninth year in succession. The delegates to the National Federation meeting are the president, vice-presidents, and Mr. R. W. Moon. The delegates to the South Wales Federation are the president, vice-presidents, and Mr. A. W. Brownscombe. Delegate to the Ratepayers' Association, Mr. Albert W. Brownscombe. The following constitute the local Conciliation Board of the Building Trades as regards the Employers' Association:—Messrs. W. Jewell, John Charles, Councillor William Augustus Linton, Councilor W. M. Blackburn, William Moore, W. R. Pitt, J. Hubert Leadbeter, R. W. Moon, A. W. Brownscombe, A. S. Morgan, Richard Richards (secretary).

Upon the motion of Mr. John Charles, seconded by Mr. R. W. Moon, a vote of thanks was accorded to the officers, hon. treasurer, hon. auditors, etc., for their past services, and to Councillor W. M. Blackburn for the use of the Assembly Hall for the association meetings.

It is interesting to place on record that during the past season, at the suggestion of Mr. A. S. Morgan (a past president of the association), Mr. John Bain, F.R.I.B.A. (now the architect to the Monmouthshire County Council), kindly gave a lecture, illustrated by superb lantern slides, on "Later Renaissance Architecture in England." Councillor W. A. Linton has been approached with a view of his preparing and giving a lecture upon his recent visit to Rome and other Italian cities.

A useful handbook has been prepared and issued to the members of this association, for the use of members only, entitled "Schedule of Prices and Charges for Day Work and Jobbing Work Generally." It has been compiled by order of the association and edited by the secretary. A special committee, consisting of practical and experienced members of the association, have devoted many months in drawing up the schedule of prices, which has been so compiled in order to ensure uniformity of charges in the trade generally "for jobbing and day work" and work where no specific agreement has been entered into. This book was issued to members on January 1st, and will form the schedule of prices until further notice.

SOUTH SHIELDS.

Secretary J. G. Robertson.

The second annual whist drive and dance in connection with the South Shields Association was held in the Crown Assembly Rooms, South Shields, on January 13th. About 120 ladies and gentlemen were present. The whole of the arrangements were in the hands of a small special committee, at the head of which was Councillor J. T. Armstrong.

STROUD ASSOCIATION.

Secretary: A. T. Browning.

A meeting of Stroud Association was held on January 16th, to receive the balance-sheet for the past year, which was read and considered satisfactory.

The following officers were elected for the year: Mr. W. F. Drew (Chalford), president; W. F. Drew and A. T. Browning, joint treasurers; A. T. Browning, secretary.

Owing to the depression in trade, there has been no business of interest during the past year.

Trade and Craft.

"Modern Factory Construction."

Under this title Mr. W. H. Brown, M.S.A., etc., of Standard Buildings, Leeds, has issued a handsome booklet in which a system of factory construction that has been patented in all commercial countries is described and illustrated. In this system the floors and roofs are not solid, but tubular, and are thus, it is claimed, rendered warm, ventilated, sanitary, insulating, sound-proof, light, and strong. They are also proof against condensation cracks, and are constructed to carry a load of 17cwt. per foot super., with 10ft. clear spans. The non-weight carrying walls Mr. Brown constructs of reinforced brick, the outer portion being a brick on flat, the inner portion a brick on edge. This cavity wall is cheap and effective, is weather-proof, and gives efficient insulation against dampness and variations of temperature. Partition walls of reinforced brick have a lateral resistance equal to 2cwt. to the square foot, and will carry heavy fire doors and support machinery gear, etc. This system of construction has been adopted in this country and in India and the Colonies by some of the largest manufacturers, as well as by H.M. Prison Commissioners, and it is claimed that the cost is often one-half that of ordinary construction. The illustrations given in the booklet afford a very clear exposition of the system.

* * *

In the notice, on p. 66 of our issue of January 20th, of Messrs. Dennison Kett and Co., Ltd., 11, Queen Victoria Street, E.C., the style of the firm should have been rendered as here shown.

Coming Events.

Thursday, February 4.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS.—Mr. B. J. Fletcher, "Notes on Town Planning."

Friday, February 5.

ARCHITECTURAL ASSOCIATION.—Mr. H. T. Buckland, on "Schools."

Friday, February 12.

MANCHESTER SOCIETY OF ARCHITECTS.—Professor Beresford Pite, M.A., F.R.I.B.A., on "The Growth of Design and Craftsmanship in English Masonry and Woodwork," 6.30 p.m.

Monday, February 15.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. T. T. Rees, F.R.I.B.A., on "The Liability of Architects to Clients and Public."

Friday, February 19.

BIRMINGHAM ARCHITECTURAL ASSOCIATION. — Mr. Frank T. Baggalay, F.R.I.B.A., on "Roman Architecture."

Friday, Febaruary 19.

ARCHITECTURAL ASSOCIATION.—Mr. A. Needham Wilson, A.R.I.B.A., on "The Poets and Architecture," 7.30 p.m.

Wednesday, February 10.

EDINBURGH ARCHITECTURAL ASSOCIATION. — Mr. William Davidson on "Norfolk Church Rood Screens and their Paintings."

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. J. A. Gotch, F.R.I.B.A., on "The Elizabethan House, as Illustrated by Contemporary Architectural Drawings."

Monday, Ferbuary 8.

GLASGOW INSTITUTE OF ARCHITECTS.—Mr. J. Honeyman, R.S.A., on "Architectural Education: A Retrospect" and a Forecast."

Tuesday, February 9.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Discussion: "Would the Establishment of a University Degree be Desirable?"

Thursday, February 11.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—Prof. C. H. Reilly, M.A., on "The Grand Manner in Architecture."

Thursday, February 18.

CONCRETE INSTITUTE.—General meeting. Mr. L. Serraillier, on "Certain Aspects of Reinforced Concrete."

New Companies.

JAMES ROBINSON AND SON (SHEFFIELD), LTD.—Registered January 1. Capital £7,500, to take over the business of manufacturers of and dealers in bricks and other articles carried on by Mrs. M. H. Armitage, Miss C. E. Robinson and Miss L. Robinson at the Park Brick Works, Duke Street, Park, Sheffield, as James Robinson.

BEWICK AND CO., LTD.—Registered with a capital of £4,000, to acquire the business carried on at 357 and 359, Deansgate, Manchester, as "Bewick and Co.," to adopt an agreement with J. Practical Notes for Architectural Draughtsmen.

By ALFRED W. S. CROSS, M.A., F.R.I.B.A.,
and ALAN E. MUNBY, M.A., A.R.I.B.A.

Complete Set Now Ready (27 Large Plates in a Portfolio), 12s.
POST FREE, 12s. 6d.

Prof. C. H. REILLY, of Liverpool University, says: "I think it is a very valuable book, and I hope it will find its way into most architectural offices."

THE "PRACTICAL NOTES" gives in most convenient form for use on the drawing board examples with concise rules, explanations and dimensions for preparing Designs, Perspectives and Working Drawings for Classical Architecture with rapidity and precision.

STUDENTS preparing for the examinations of the R.I.B.A. can learn how to draw The Orders correctly with the smallest possible amount of study and work by utilising the invaluable drawings and data given in this publication.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Feb. 4. PETERHEAD.—Erection of new corridors at Boddam public school. Plans and specifications may be seen with, and schedule of quantities obtained from the architect. Masons and carpenters should submit tenders by 10 a.m. on Feb. 4 to James Watt, C.E. and architect, 26, Marischal Street, Peterhead

Feb. 4. BRYNMAWR (Mon.).—Rebuilding the old Castle Inn, Brynmawr, Mon., for A. Buchan and Co., Rhymney Brewery, Rhymney. Plans and specification may be seen with T. Roderick, architect, Clifton Street, Aberdare, where bills of quantities may be obtained on application. Endorsed tenders to be sent to T. Edwards, Rhymney Brewery, Rhymney, Mon., by mid-day on Feb. 4.

Feb. 5. ABERCYNON.—Erection of a detached house at Abercynon for D. Evans. Plans and specification may be seen at the office of William Dowdeswell, architect, Treharris, and also at Greenfield House, Abercynon. Tenders, endorsed "House at Abercynon," to be delivered by Feb. 5 to D. Evans, Greenfield House, Abercynon.

Feb. 6. SCAMPTON.—Erection of a new chapel and classroom at Scampton. Plans, etc., may be seen either at Mr. Chantry's, Scampton, or the Rev. A. Morter's, 102, Burton Road, Lincoln.

Feb. 6. HOLYHEAD (Wales).—Erection of a Baptist chapel and school at Holyhead. Builders desirous of tendering may obtain full particulars and bills of quantities from W. Beddoe Rees, architect, 3, Dumfries Place, Cardiff, on deposit of three guineas. Tenders to be delivered by February 6.

Feb. 6. CHILCOMBE.—Erection of a coachman's cottage at Chilcombe, Bicknoller, near Williton, for the Rev. Cecil Martin. Drawings, etc., may be seen at offices of F. W. Roberts, F.R.I.B.A., architect, 2, Hammet Street, Taunton. Tenders to be submitted by Feb. 6.

Feb. 6. NODDFA, TREORKY. — Execution of large extensions at Noddfa Chapel, Treorky. Plans and specification can be seen at the office of Jacob Rees, architect, Pentre, and tenders to be delivered to James Thomas, provision merchant, High Street, Treorky, by Feb. 6.

Firms tendering must submit particulars of their quarries (which must be situated in Kent) and the material must be manufactured in the county. Sealed tenders must be delivered by noon on Feb. 8, to Fras. W. Crook, secretary, Caxton House, Westminster, S.W.

Feb. 9. POTTERSPURY.—Supply of granite (broken and unbroken), and slag for the year ending March 31, 1910, for the R.D.C. Forms of tender, with quantities required, and full particulars, may be obtained on application to James B. Fairchild, Potterspury, Stony Stratford, surveyor to the council. Tenders, marked "Tender for Materials," to be sent by Feb. 9, to W. R. Parrott, clerk to the council, High Street, Stony Stratford. Samples of stone to be delivered at the workhouse, Yardley Gobion, by Feb. 9.

Feb. 10. BRADFORD.—Supply of about 20,000 tons of road metal, required for the macadamised roads within the city, for the corporation. Form of tender may be obtained on application at the office of W. H. S. Dawson, city engineer and surveyor, town hall. Sealed tenders, endorsed "Tender for Road Metal," to be sent to Frederick Stevens, town clerk, town hall, Bradford, by Feb. 10. Fair wages clause.

Feb. 10. WELLINGTON (SALOP).—Kerbing, channelling, and flagging with adamant concrete a number of streets and footpaths in the Urban District of Wellington, Salop. Plans and sections of the proposed works (in four separate contracts) may be seen at the office of Geo. Riley, the council's surveyor, 14, Walker Street, Wellington, Salop, by appointment, and on production of copy specification and quantities. Specification and quantities of the four contracts may be obtained from the clerk, on deposit of cheque for £2 2s. Sealed tenders, endorsed "Streets," must be sent by Feb. 10 to J. W. Littlewood, clerk to the council, Bank Chambers, Wellington, Salop.

Feb. 11-22. SPALDING. — Supplying granite, slag, shingle, and gravel for the repair of highways, for the R.D.C. Tenders must be made on forms which may be obtained on application to H. Stanley Maples, clerk to the council, or will be sent on receipt of addressed envelope or post wrapper, delivered by Feb. 11, Samples to be sent to the union workhouse, by 9 a.m. on Feb. 22.

Feb. 12. HORNCASTLE.—Supplying about 6,485 tons of granite (XX) and about 1,440 tons of slag ($1\frac{3}{4}$ in.) to be delivered between April 1 and Oct. 30, in quantities and at times as the council or district surveyor shall direct. Specifications, conditions of contract, and forms of tender may be obtained on application at the office of the council. Tenders, marked on the cover, "Tender for Road Material," must be sent by post by Feb. 12, to J. E. Chatterton, clerk, council offices, Horncastle. Sureties possibly required.

Feb. 13. ILFORD.—Levelling and tar-paving the playgrounds of Valentine's School, Beehive Lane, Ilford, for the Education Committee. Plans and specifications may be seen, and form of tender obtained, upon application to the architect, G. J. Dawson, F.R.I.B.A., 11, Cranbrook Road, Ilford. Tenders, in sealed envelopes, endorsed "Tender for Tar-paving," to be delivered by noon on Feb. 13th, to W. S. Torbitt, M.A., LL.B., secretary, education offices, Cleveland Road, Ilford.

Feb. 13. BATH.—Supply of granite and basalt in lump; also macadam and chippings, for the county main roads, to be delivered to the various stations, wharves, and sidings, during the financial year ending March 31, 1910, for the Somerset county council. Specifications, schedule of approximate quantities required at the various stations and wharves, and forms of tender can be obtained upon application to the county surveyor, Bath. Sealed tenders, endorsed "Tender for Road Material," and samples of the macadam to be delivered by Feb. 13, to H. T. Chapman, county surveyor, 1, Chapel Row, Queen Square, Bath.

Feb. 15. GOSPORT AND ULVERSTOKE. — Making up the following private streets, for the U.D.C.: Bevis Road, Blake Road, Burnett Road, Coward Road, Cobden Street (part of), Parham Road, Stone Lane. Plans may be seen and copies of the specifications, bills of quantities, and forms of tender obtained at the surveyor's office on deposit by cheque of two guineas. Tenders must be sent in special envelopes supplied, by noon on Feb. 15, to E. Talbot Palmer, clerk to the council, Gosport.

Feb. 15. STREATHAM.—Making up and paving Parklands Road, Streatham, for the corporation of Wandsworth. Specification and drawings may be seen, and forms of tender obtained, at the borough engineer's office (new streets department), 56, East Hill, Wandsworth, S.W.), between 10 and 4 (Saturdays 10 and 12). Tenders, enclosed in sealed envelopes, and endorsed "Tender for Paving Parklands Road," must be delivered at the Council House, East Hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose by 4 p.m. on Feb. 15. Sureties may be required. Fair wages clause.

Feb. 16. LONG SUTTON, Lincs.—Supplying:—Granite, 590 tons XX broken. Slag, 100 tons, $1\frac{3}{4}$in. broken, also separate tenders for:—Granite, 150 tons X broken. Slag, 200 tons $2\frac{1}{4}$ in. broken, for the U.D.C. To be delivered, carriage paid, to Long Sutton station during the year in quanitites and at times ordered by the surveyor. Tenders, with samples, to be sent marked "Tenders for Material," by Feb. 10, to Saml. S. Mossop, clerk to the council, Long Sutton, Lincolnshire. The council have no form of tender.

Feb. 17. GLOUCESTERSHIRE.—Supply of stone for use on main roads for the year beginning April 1, 1909, and ending March 31, 1910, for the County Council. Forms of tender can be obtained from the county surveyor. Tenders must be delivered by Feb. 17th, marked outside "Tenders for Material," to E. S. Sinnott, M.Inst.C.E., county surveyor, Shire Hall, Gloucester.

Feb. 22. LITTLE HULTON (near Bolton).—Supplying broken granite, grit setts, granite and limestone chippings, grit kerbs, artificial and natural flags, stoneware pipes and gullies, cement, steam road rolling and scarifying, disinfectants, pitch and oil, for the U.D.C. Forms of tenders and particulars can be obtained from James H. Heyes, clerk, council offices, Little Hulton, near Bolton, any day between 9 a.m. and 5 p.m. Tenders, sealed and endorsed "Tender for ——," to be delivered at the council offices by 4 p.m. on Feb. 22.

March 2 MERIONETH.—Maintenance and repair of the rural main roads of the county, for the C.C. Particulars, specifications, bills of quantities, etc., may be obtained on application to E. Vaughton, county surveyor, Arthog, Dolgelley. The county is divided into 4 districts, and intending competitors may tender for any or all. As it has not been definitely decided whether the contract will be let for a period of 1, 3, or 5 years, tenders must be sent to cover each of those periods. Tenders to be delivered to David Breese, clerk to the council, Portmadoc, by 10 a.m. on March 2.

MISCELLANEOUS.

Feb. 8. MANCHESTER.—Execution of general contractors' and plumbers' work that may be required for the corporation, in connection with the drainage of houses and other premises, for a period of twelve months, ending March 31, 1910. Forms of tender, general conditions and specifications for each of the seven sections of the city may be obtained and samples of work and materials seen on application to H. Prescott, manager of the drainage department, on payment of £1 1s. for each of the said sections. Sealed tenders, addressed to the chairman of the drainage, etc., sub-committee, will be received at the drainage department, by 10 a.m. on Feb. 8.

Feb. 16. BROMLEY.—Supplying timber, ironmongery, builders' materials, tools, oils, paints, etc., ironfounders' work, tar-paving materials, steam road rolling, for the Corporation. Particulars and conditions may be obtained at the Municipal Buildings on payment of 10s. Tenders, duly sealed and endorsed, must be delivered to Fred. H. Norman, town clerk, municipal offices, Bromley, Kent, by 3 p.m. on Feb. 16.

No date. TYERSAL.—Execution of slater's, plumber's, and plasterers work, required for 23 houses, Akeroyd Park, Dick Lane, Tyersal. Persons desirous of tendering should apply to I. F. Akeroyd, 31, Springfield Crescent, Lidget Green, or on the job.

THE
Federated Employers'
Insurance
Association, Ltd.

HEAD OFFICES:
30, Cross Street, MANCHESTER.

Non-Tariff—Founded by Builders.

THIS ASSOCIATION GUARANTEES THE DUE PERFORMANCE OF CONTRACTS and invites enquiries from Contractors in matters incident thereto. Negotiations tend to prompt and effective arrangements.

BUILDERS' RISKS so far as WORKMEN'S COMPENSATION AND PUBLIC LIABILITY are concerned form special features in connection with the Association's operations. Moderate Rates and equitable conditions apply.

FIRE, PERSONAL ACCIDENT AND ILLNESS, and miscellaneous Insurances are transacted.

Submit enquiries.

Federation Secretaries are invited to apply for an Agency

GEO. L. DREW,
General Manager and Secretary.

Telephone: 5948 Manchester.
Telegraph: "Federated, Manchester."

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 5 o'clock on Monday evening.

ADVERTISER (28), seeks re-engagement, ten years' thorough practical knowledge of building, estate management, and repairs, etc.; experienced in preparing plans and estimates, including quantities, for new works: highest refs. — Y., 86, Coniston Road, Muswell Hill, N. 4805

ARCHITECT'S and Surveyor's Assistant (25), 9 years' London experience; working drawings, designs, specifications, supervision, etc.; land surveying, and assist with quantities; prizeman and medallist.—W., 20, Holmewood Road, Streatham Hill. 4809

ARCHITECT'S Assistant (22), six years' experience; student R.I.B.A., good draughtsman, contract drawings, details, surveying, etc.; assist with quantities; salary moderate.—J. J. S., 1, Silver Street, Stockton-on-Tees. 4828

ARCHITECT and Surveyor's Assistant desires engagement; 6½ years' sound provincial experience; good draughtsman, working drawings, details, colourist; perspectives, surveying, levelling; assist quantities; general routine, specimen drawings; highest references; moderate salary.—S. Osgood, Chelsfield Park, Orpington, Kent. 4801

ARCHITECT and Surveyor's Assistant (25), six years' London experience, design, surveying, quantities, Hon. Building Construction Inter.R.I.B.A.; excellent references; salary £2 2s.—Apply Box 4780, Builders' Journal Office.

ARCHITECT'S Assistant (23), desires engagement; 7 years' eaxperience.—Sedgwick, Belvedere Road, Sunderland.

ARCHITECT and Surveyor's Assistant (25), 9 years' experience; excellent draughtsman, working drawings, details, specifications, perspectives, surveying, French, typewriting; moderate salary.—Arthur Bailey, 26, North Street, Hailsham, Sussex. 4819

ARCHITECT'S Assistant (23), late pupil, seven years' all-round experience, been clerk of works, working drawings, details, etc., knowledge of quantities and perspective.—E. P. Lee, 631, Commercial Road, London, E. 4781

ARCHITECTS, builders, estate agents (19), good energetic draughtsman, tracing, colouring, working drawings, etc.; willing to assist in office work; references.—F. J. Williams, 89, Shrubland Street, Leamington Spa, Warwickshire. 4796

ARCHITECT'S good all-round Assistant; 10 yrs.' exp. North, South, and Wales; quans., details, working drawings; mod. salary.—W. T., 14, Stanhope Road, Stockton-on-Tees. 4798

ARCHITECT'S assistant (23), over 7 years' London and Provincial experience; excellent references; Inter.R.I.B.A. Exam. — H. J. Wilson, "Brinkdale," Park Road, Peterborough. 4670

ARCHITECT and Surveyor's Assistant (21), seeks re-engagement; 5 years' experience in church and domestic work in larger provincial office; good draughtsman and colourist.—Box 4823, Builders' Journal Office.

ARCHITECT'S Junior Assistant (19), 4 years experience in West End Office, working drawings, details, perspectives, competitions, excellent references; salary 21s.—Box 4777, Builders' Journal Office.

ARCHITECT'S Assistant (23), seven and a quarter years' varied London and provincial experience. First-class draughtsman, details, surveying, and general routine. Excellent references. Inter. R.I.B.A.—H. J. Wilson, 90, Park Road, Peterborough. 4812

ARCHITECT'S, Surveyor's or Builder's Assistant (23), Inter.R.I.B.A., good draughtsman, levelling, surveying, specifications, assist quantities, supervision, estate work, correspondence, accounts; excellent references; moderate salary.—H. O'R., 80, Lavender Sweep, Clapham, S.W. 4810

ARCHITECT'S Assistant, thoroughly experienced, temporary employment; domestic work, business premises, schools, etc.; surveying and levelling, etc.; two years' experience in Structural Engineer's office; salary moderate. — Box 4820, Builders' Journal Office.

ARCHITECT'S Junior Assistant disengaged, 4½ years' articles, wishes to meet with architect in Lancashire office; specimen drawings, certificates for construction; sitting for Inter. R.I.B.A., June.—Box 4815, Builders' Journal Office.

ARCHITECT, estate agent, or builder's assistant, experienced in all branches; good references.—R. S., Eagle House, Marine Parade, Clacton-on-Sea. 4816

ARCHITECTS, and builders, experienced surveyor open to prepare quantities and estimates, check accounts and measuring; moderate terms.—Apply Box 4817, Builders' Journal Office.

ARCHITECT'S son, 10 years' office experience, wishes to take up agency or post as representative in Lancashire, or North of England, to well-known firm in any special line of Building trade. —Apply Box 4585, Builders' Journal Office.

ASSISTANT (27), good rapid draughtsman, competent all branches, will accept small salary for re-engagement in or near London.—Ernest Frost, "Dunsmore," Horeham Road, Sussex. 4824

ASSISTANT A.R.I.B.A. (29), 14 years' London and Provincial experience; working drawings, details, specifications, supervision, perspectives, assist quantities, well up in management; testimonials; references; salary, 2 guineas.—Apply A, 31, Cotswold Road, Westcliff-on-Sea, Essex. 4775

BUILDER'S general foreman, advertiser seeks engagement; 16 years' service as above with first-class London firm on important and various works; good references.—Address H., 150, Effra Road, Wimbledon, S.W. 4703

BUILDER'S or architect's assistant, 25, desires re-engagement, drawing, typewriting, shorthand, correspondence, accounts, and general office routine; also assist in quantities; excellent references, moderate salary.—Apply Box 4756, Builders' Journal Office.

BUILDERS' Assistant desires work; plans, estimates, setting out buildings, measuring up, prime costing, surveying, and levelling plots, ordering exact quantities, materials; 11 years' experience.—Box 4803, Builders' Journal Office.

BUILDER'S or Architect's Junior Assistant (18), good tracer, well up in prime cost, and general office work; excellent references; three years' experience. — J. W., 164, Wellesley Road, Ilford, Essex.

CLERK of Works seeks re-engagement; just finishing public building; varied experience, notably ferro-concrete construction; well recommended; testimonials most excellent; age 45.—A. B., Box 4814, Builders' Journal Office

CONTRACTOR'S outdoor manager and surveyor desires engagement; present situation 17 years; age 37; keen on variations; expert in measurements; all trades, quantities, estimating; town or country.—W., 2, Dalberg Road, Brixton. 4776

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, Builders' Journal Office.

ENGINEER, general, wants permanent appointment, **official or private staff; thorough all-round** experience; **electrical, plumbing, smith, married,** 34; good **testimonials.—86, Bathurst Gardens,** Willesden. **4704**

ESTATE Owners.—Bricklayer, all-round, stone-waller, and general repairs; abstainer; good references; moderate wage for permanency.—Quinton, 12, Holland Road, Aston, Birmingham. 4802

FIREPROOF Engineers and Concrete Specialists. Advertiser, connected with above trades for 10 years, and whose name is well known in connection with same, desires position as manager, traveller, or head clerk; first-class book-keeper; aged 33; very moderate salary.—P. W. Potter, 73, Penshurst Road, Thornton Heath. 4719

FIRST Class Architectural Designer and Draughtsman, artistic and practical, experienced in planning; elevations and details, office and competition work; moderate salary.—Apply Box 4792, Builders' Journal Office.

FOREMAN Painter (working) seeks re-engagement); experienced in all class work in building trade, as for general alterations, etc.; good supervisor, and reliable; either town or country; abstainer.—X. Y. Z., 8, Barton Street, Westminster. 4807

GENERAL Foreman seeks re-engagement, thoroughly practical in all branches; trade, carpenter and joiner, good draughtsman, first class references; town or country.—A. J., 196, Murchison Road, Leyton. 4804

GENERAL Foreman seeks re-engagement, town or country; thoroughly practical in all trades; energetic, reliable and good manager of men; good references.—E. C., 15, Park Road, Merton, S.W. 4778

GENERAL Foreman seeks re-engagement; alterations or new, practical experience in all branches; carpenter and joiner; good references; age 36; moderate wages.—Caplen, 3, Victoria Mansion, Edgware Road, Paddington, W. 4779

GENERAL Foreman seeks re-engagement, thoroughly practical and reliable; new or alterations; carpenter and joiner; life abstainer; first-class references.—Foreman, 3, Hawbridge Road, Leytonstone. 4787

HEATING.—Schemes, quantities and prices, tracing, workmen's sheets and costs; shorthand-typist (speeds 90/40); 5 years in Midlands; good refs.; disengaged.—Box 4834, Builders' Journal Office.

JUNIOR Assistant desires situation, home or abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate salary.—Box 4613, Builders' Journal Office.

PLUMBING, etc., Sanitary or Lead-laying, job wanted, day or piecework; anywhere; lowest prices; best work; excellent references; used to speculating or jobbing.—Squirrell, 47a, Woodland Street, Dalston, N.E. 4749

QUANTITY Surveyor's Assistant (21), 4 years' experience, desires engagement, certificates and good references. — Apply Box 4745, Builders' Journal Office.

QUANTITY Surveyor's Assistant, temporary assistance rendered in taking-off, measuring variations, land surveys, dilapidations, etc., by experienced surveyor; references. — Box 4808, Builders' Journal Office.

REINFORCED concrete foreman, disengaged, long and varied experience, especially in Kahn bars and expanded metal, timbering a speciality; carpenter by trade; good refs.—G. C., 59, University Road, Tooting, London. **4721**

R.I.B.A. Final Exam., 7 years' experience, 1½ in Paris; good all-round man requires berth at home or abroad; good refs.; salary moderate.—Box 4799, Builders' Journal Office.

SURVEYOR'S, Architect's Assistant (27), good varied architectural, municipal and engineering experience; contract drawings, details, assist quantities, surveys, levels, etc., houses, schools, works, sewage works, roads, etc. Salary £2 5s.—Box 4811, Builders' Journal Office.

SHOP or General Foreman, long West-end experience, used to alterations and repairs; understands stairs; used to good jobbing work. Address A., c/o Mr. Seymour, 14, Allsop Place, Regent's Park, N.W. 4586

SUN copies, tracings, and plans prepared.—Geo. Tune, Trevor, Llangollen, N. Wales. 4831

SHOP or general foreman, good draughtsman, good all-round experience, including reinforced concrete work; or as estate manager, preparing plans for same, etc.; country preferred. — "St. Osyth," Goldsworth Road, Woking, Surrey. 4829

School Architecture. The paper on the planning of schools, which was read last Friday by Mr. H. T. Buckland to the Architectural Association, is certainly a most valuable contribution to a subject of perennial and ever-increasing importance. It is a mere truism to say that the influence of the school building upon national life and character is so potent as to demand the utmost skill and care as to site, planning, sanitation, ventilation, and appearance. Mr Buckland has given to all these matters, and to some others, the most thoughtful and studious attention. But, as Mr. T. J. Bailey, the education architect to the London County Council, has pointed out, Mr. Buckland has not dealt with schools of the higher elementary type, nor with the special requirements of schools for the mentally and physically defective. Seeing the length of the paper as it stands, one is by no means surprised at the omission. Mr. Bailey's very welcome appearance on the scene reminds us of the splendid work he has done during his long tenure of office, and makes us hesitate to make a comment that suggested itself whilst we were listening to Mr. Buckland's paper. But, in a matter of national importance, merely personal consideration should not be allowed to stifle honest opinion. We, therefore, feel compelled to reiterate what we have found occasion to say before with respect to official architecture. We do not think that the best interests of architecture are served in the best way when all the schools of a great city are stamped with the individuality of one man. The Council schools of London, which meet the eye at every turn, are a case in point. Even if they were beautiful exceedingly, their monotonous style would be extremely wearisome. But we do not think them beautiful, although it must be admitted that they might have been much worse. On the other hand, they might at least have some diversity of elevation. Not that they are all exactly alike; but they all, or nearly all, show the impress of the same mind. From such deadly uniformity there is but one way of escape. The work should be thrown open to competition The educational authority would still need its official architect, but his function would be mainly advisory. His advice would be invaluable, because his position and experience afford him unequalled opportunities of becoming an expert specialist in the essential requirements of this class of building. He would provide in the recognised way for every detail that tended to the health, comfort, and convenience of teachers and pupils; but the designs would show more originality and variety than could be expected from any one man, however versatile his gifts. London being hopelessly committed to the single-mind policy, our contention applies more forcibly to other parts of the kingdom, whose educational activity is only just beginning to find concrete expression. A school should teach by its exterior something of the dignity and amenity of knowledge, and it is only in open competition that the realisation of this ideal can be approximated in any given instance. Without the slightest disparagement to the London County Council educational architecture department—which, by the way, has just been reorganised without giving effect to our contention—it may be said that those provincial authorities that have anticipated the course we advocate, have chosen the more excellent way.

Conciliation and Disaffection. It is somewhat surprising to notice, from the reports of the proceedings at the annual meeting of the National Federation of Building Trades Employers, that, dissatisfied with certain results of Conciliation Board voting, one or two associations have apparently threatened to sever their connection with the parent body. Taking an entirely independent view of the situation, we suggest that such an extreme course is unwise and unnecessary. The Conciliation Board is a comparatively novel institution, and a perfect machine, if attainable at all, can only be evolved experimentally. Still, whatever its present shortcomings, and whatever imperfections it may happen to share in common with the highest legally-constituted tribunals, which, in spite of every precaution that the wit of man can devise, are unable to prevent an occasional miscarriage of justice, the Conciliation Board—we are referring to no special Board, but to the institution—has been, on the whole. amazingly successful. It has succeeded beyond the most sanguine anticipation in the difficult task of suppressing industrial strife. It has finely vindicated an excellent principle, and has completely justified its existence. Any premature action, therefore, which may tend to weaken its influence and authority, can only be regarded as extremely regrettable, and we can only suppose that the threats to forsake it must have been prompted by momentary disappointment with unexpected decisions, and are therefore not to be taken too seriously. The disaffected members will best serve their own individual interests, as well as those of the entire trade, by yielding loyal support to a principle that is unassailable, and to an organisation that, being of human invention, is certainly liable to error, but has, nevertheless, proved itself invaluable and indispensable; and it especially behoves employers to set an example to the workmen in the noble art of playing the game, even when it goes somewhat arbitrarily against one's own side. No committee is infallible.

Architectural Stimulus. Very few men whose knowledge of the past is at all comparable to that of Mr. W. R. Lethaby have anything like his felicity in turning it to practical account. Of this happy union of talents a further example was given last week, when Mr. Lethaby delivered, at the Midland Institute, Birmingham, an inspiriting lecture on "Local Patriotism and Art Production." The magnificence of ancient cities, he supposed, arose from the keen artistic rivalry between them, and the same competitive spirit gave us our finest early ecclesiastical buildings. Local patriotism —pride in one's own city—found expression in art and architecture. But the lecturer seems to imply that nowadays we have become too cosmopolitan to be very sensitive to the stimulus of local patriotism. "By the great centralisation which had taken place in London, not only had county capitals and the big towns ceased to compete with her; but London herself, no longer conscious of the rivalry of Edinburgh, Dublin, York, and Bristol, had fallen into gross slackness and slatternliness." The theory of excellence through emulation is doubtless sound enough; and, indeed, the principle would seem to be vital and fundamental. That it has lanquished from the causes and to the extent suggested by the lecturer is open to question. When London was comparatively small and insignificant, the county towns were too remote from it to think of competing with it. Travelling by pack-horse did not afford sufficient opportunities of comparison to stir up emulousness. The rivalry was between near neighbours, as the lecturer himself indicated when he remarked that "the foundations of the old cathedral at Coventry were enough to show that there was rivalry with Lichfield, and that one imitated the other." London itself, one can easily imagine, is more concerned in rivalling the Continental capitals; who, in their turn, are more strongly impressed with what London can show of grandeur than with its "gross slackness and slatternliness." This rhetorical expression might be more justly applied to Paris, whose municipal councillors, on their last visit, were as much struck by the tidiness of the London streets as by the dignity of the buildings. In these respects they are determined to rival us, and some of the English visitors to the International Congress of Architects held in Vienna last year seem to think that Baroque and beauty are synonymous terms. It would seem probable, therefore, that the modern facilities for travel and intercommunication are not wholly antagonistic to emulation, although they may possibly tend to the destruction of local feeling and character, as well as to the correction of insular prejudice. It is difficult to believe that larger knowledge, a wider field for comparison, and a better understanding and appreciation of the work of our neighbours are incompatible with the "love of home, love of city, and love of country," that, as Mr. Lethaby maintains, form the groundwork of the patriotism that he supposes to be so potent in the promotion of worthy architecture. Mr. Lethaby thinks that the present obliviousness to beauty is largely a result of the sudden expansion in our towns which followed on the introduction of railways, and he hopes that the "period of rapid swelling" will be followed by an "era of tidying-up, smoothing-out, and letting-in of sweetness and of light." Our railways, indeed, have much to answer for, particularly with regard to their stations, which not only tally too faithfully with his description of them as "colossal advertisement sheds, dirty, shabby, and irritating," but also have a blighting influence on the districts they disfigure. Their utter inferiority to Continental and American stations is a proof that in this direction international emulation has failed us. Our railway magnates lay too much stress on engineering, and too little on architecture; and they possess so much power that it is almost beyond hope that they will be bound by the sweet influence of the Town Planning Bill to show some regard for decency, if not for beauty.

The Bad By-law and the Defiant Duke.

Although in the main, we Britons doubtless deserve our reputation as a law-abiding people, it must be admitted that there are circumstances in which we hail with satisfaction and delight some instance of the breaking of the law. Hence, perhaps, the enormous popularity, some few years ago, of a picture, entitled "Defying the Law," in which was seen the heroic figure of a John Bull-like country gentleman who, ebullient with (doubtless) righteous indignation, stood at the top of a flight of steps, at the bottom of which, in picturesque confusion, were huddled the bodies of two "fired-out" process-servers. Popular sympathy was with the law-breaker—the honestly irate gentleman who had, as it were "taken the law into his own hands," and unceremoniously kicked it down the steps. As with the law, so with the by-law. There seems to be a popular impression that a bad by-law should be more honoured in the breach than in the observance. When Judge Grantham defied the Chailey Council and all its works, he became for the nonce a popular hero. The popular feeling seems to be that it is a meritorious action to break a by-law when you want to see it mended. This is the course that has been taken by the Duke of Northumberland. He was summoned by the Hexham Rural District Council for a breach of their by-laws "by erecting a new building at Barrasford of wood instead of brick, stone, or other hard or incombustible material." The Duke "deliberately, and in defiance of the by-laws, was found, in March of last year, to be erecting a building which was in substance a wooden erection." It was a wooden structure—a fish-hatchery—lined with asbestos. The defence was that the Duke took his stand as a matter of principle. He wanted to make it perfectly clear that the Council were applying the wrong by-laws. They were attempting to enforce, in a rural district, the by-laws that, in 1875, were made by the Local Government Board with an eye to the requirements of urban districts. Defendant's counsel agreed that, in the circumstances, the authority had no option but to proceed against the Duke, who, however, was determined to make it quite clear that the Council had the right to adopt other and more appropriate by-laws, such as were applicable to rural or semi-rural parishes. Probably the Duke expected to smart for his temerity, and no doubt he was prepared to suffer in so good a cause. If so, he perhaps found the result rather disappointingly tame. Once again were the uncertainties of the law made manifest. The Duke got off scot-free. The chairman of the Bench "intimated that they had very carefully considered the case, and, under the very exceptional circumstances, they had decided to dismiss it." Now, bad and antiquated by-laws are by no means peculiar to Hexham; but the Duke's example should not be followed, either there, or elsewhere, by mere commoners. There's a divinity doth hedge a Duke, and builders who happen to fall below that rank cannot confidently reckon that the precedent set by the Hexham Bench will be invariably followed. Where the by-laws are bad, the builders should combine to get them altered by less dramatic but more constitutional means.

Winchester Cathedral.

It appears from the latest report upon Winchester Cathedral, presented by Mr. T. G. Jackson, R.A., that the faults and weaknesses brought to light as the work of reparation advanced, will require the expenditure of a total of £99,000 to ensure the safety of the fabric. Thus to stop short of the century of thousands is, perhaps, an evidence of careful estimating, but, even so, it is, in Shylock's phrase, "a good round sum." As the amount realised by public subscription always seems to fall short of the actual amount required, and as we may not even yet have reached finality with regard to the defects, it might have been well to make a bolder appeal, on the principle that "he who shoots at the moon o'ertops the highest tree," and this continuous asking for yet a little more may ultimately find the public weary and unresponsive. This would be a thousand pities; for there is surely no building in England that is better worth preserving than Winchester—except, perhaps, Canterbury, which seems, indeed, to rival Winchester at every point—in the splendour of its beauty and of its beggary, and especially in the insecurity of its foundations: in which respect, however, the doubtful honours are with Winchester, since it has not yet been found necessary to employ divers at Canterbury. The methods of the old builders are instructively exposed by Mr. Jackson, who, in his report, makes the following interesting and rather startling statement: "The floor of the Lady Chapel (of Winchester Cathedral) had sunk owing to the giving way of the columns and vaulting below. When the easternmost column in the crypt had been collared and taken out it was found that it had crushed its base, which was broken in pieces, the middle having sunk, and the four corners being tilted upwards. Below was discovered a great wooden pile, 15 in. in diameter, on the head of which the column rested; and as the wood was so rotten that it could be cut with a spade, the subsidence of the vault was sufficiently accounted for. The column was re-set on a new pier of concrete and brickwork, resting on the gravel about 17 ft. below the outside ground. The second was afterwards underpinned also. The whole of the crypt vaulting had been disturbed by the movement of the walls; it has now been repaired by grouting and bonding—a very long and tedious operation." Well is it that the reparation has been entrusted to such capable hands, and we can only hope that Mr. Jackson will not be hampered in his good work by stinting of the necessary funds.

Unfair Contracts.

We are glad to see that the question of the unfair contract conditions imposed by public bodies, to which we drew attention in a recent issue, has been taken up very vigorously by the local press. It will be remembered that the Official Receiver in the course of a case that came before him in the Newcastle Bankruptcy Court, made some scathing observations on a form of contract which he described as "absolutely confiscatory." Taking up this parable, the "Shields Daily Gazette" makes the following observations: "It is the custom for a council to guard itself against any failure or possible defects by a particular form of contract that is all in its favour and all against the other side. It is a form, it is true, that has official sanction, but its adoption is not compulsory. Under the Local Government Act of 1894, a desire was shown to protect the interests of District Councils in every possible way, and it certainly cannot be charged against this contract form that it errs on the side of leniency. . . . . This particular agreement provides that, in the event of delay or failure to complete, the contract becomes void at the option of the Council and the amount then already paid to the contractor by the Council 'shall be deemed to be the full value or price of such work as shall have been executed and such materials as shall have been supplied by the contractor up to the time when such notice (seven days) shall have expired, and no further claim shall be made by the contractor under these presents in respect of the works or any part thereof.' Delay in completion means that the contractor must pay 10s. per day, and if there is default, a sum of £200 'as and for liquidated damages for breach of this contract.' . . . In the case of the small contractor it is easy to be seen that the result might be disastrous, and that his failure might reflect to a more or less serious extent on others. It is not suggested that the Haltwhistle Council applied the screw with undue force. The purpose here—as we take it the Official Receiver's purpose was too—is to call attention to the possibilities for evil of the system, because it is one that causes others to suffer in addition to those immediately concerned."

MR. ERNEST GEORGE'S ADDRESS TO STUDENTS.*

It is my privilege to-night to address our future architects, our students, may I say my fellow-students of architecture?—for the study of the great art is not accomplished in a lifetime. The young, however, have a capacity for learning and assimilating when the old have got into ruts and have acquired prejudices that hinder the reception of new impressions.

I speak to you who have the responsibility of remodelling our cities and of making the world that is to be, I trust with a great increase to its beauty. An artist paints his picture, and if it fails it can be obliterated, or if it has meretricious cleverness it endures for a time, but when found out its place need know it no more. In the art of building the case is more serious; what we build must be seen whether we will or no; it has its influence on the "man in the street." It may be a source of pleasure, or it may cause familiarity with and toleration of that which is bad.

Architects Must be Builders.

As architects it is a first necessity that we should be *builders*, for the arts of building and of architecture cannot be separated. The simplest structure may attain to architecture by admirable proportion and by a wise disposition of the parts; whether decoration comes in or not is of secondary importance. The question of style is a minor matter, for the artist's hand will be evident in the work, whatever the treatment he affects or the vogue of his time.

The education of the architect has been taken seriously of late, and his facilities for study are greater than ever before. I will not discuss the details of the training of which you have the advantage, but with it all I would say that what you do earnestly for yourselves is worth more than all that your able professors can do for you. They will endeavour to put you on the right path and to inculcate the principles, but it remains for you to give them practical application.

Much has been said about technical training, with the study and handling of material; and it would be all to the advantage of the architect that he should be a good joiner, mason, or worker in metal. When drawing a moulding he should have stone, oak, or plaster in his mind. He has so many good books of "Examples" now that he is apt to become a paper architect, losing familiarity and touch with the realities of building. Modelling is a useful accomplishment, and should be part of the training: it aids in the expression of ideas where the pencil often fails. The architect has, however, in the few years that can be given to preparation, so much to acquire that he can hardly spare time to grow efficient in the various crafts. Some have found practical knowledge by a term in a builder's yard, and I think I am right in saying that this was the early training of John F. Bentley, whose architecture gives evidence of his knowledge as a masterful constructor. Still, a boy must leave school prematurely and in a half-baked condition if he seeks apprenticeship to the crafts, and it is difficult to say at what age general education should give place to specialising.

Dr. Christopher Wren.

The greatest architect that England has produced was known only as a man of science and a professor of astronomy until the age of thirty, when the resources of his great mind were turned to the art of building, at which he presently showed himself an accomplished artist. Notwithstanding this late start in life, Dr. Christopher Wren was allotted sixty years in which to build our Cathedral, rebuild our City, and raise the many monuments that he has left to us as a precious heritage.

With the rudiments of scheming and planning, freehand drawing must be cultivated; and working from the cast and from the figure is perhaps the best training for the eye and for the hand, while it teaches a sense of proportion.

No work is more profitable than the measuring and careful study of existing buildings, making choice of fine specimens, and I am pleased to state that suggestions and directions for the guidance of students will shortly be published by the Institute in pamphlet form, giving a list of examples throughout the country that are considered most useful for study, also specifying those which will be valued as an addition to our architectural records. Those of you who go out with our scholarships, instead of sketching in a desultory way, will be advised to study seriously some building of distinct architectural merit, and it is intended that the result shall be published in some permanent form. It should add to the student's zeal and interest if he feels that he is thus contributing to the world's store of knowledge. See what details and mouldings give the strength and the quality that you admire; note their size and projection, but, doing this, show also their place on the building. Note-books are sometimes filled with interesting doorways or windows, without a record of their relation to one another or to the wall-spaces that give them value. Study critically the buildings that impress you as fine; find out where and why they are good. It is a curious thing that criticism has come to mean exposing the faults; that is the easier and the more telling form, but it is a bad spirit to adopt. I have often been shocked at the flippant criticism by mediocre men of fine work of which they would themselves be quite incapable. The faults they see probably exist, but the quality and essence of the building are not in those imperfections. Make mental notes, if you will, of ways that you feel should be avoided,

---

*Delivered by the President, Mr. Ernest George (Royal Gold Medallist, 1896), at the General Meeting, February 1st, 1909.

THE TOWN HALL AND PUBLIC OFFICES, HARRISMITH, NATAL. PRICE AND AGUTTER, ARCHITECTS.

but seek the good first; it is the more profitable study.

As architects you will often be asked what you think of this man or that; perhaps you do not feel the architect in question to be one of our great lights. Let me beg of you to stretch a point and say all that is generous, though perhaps of a rival. It is unsportsmanlike to give away a professional brother or to damn him with faint praise. His reputation is his stock-in-trade. Let us among ourselves use all frankness: it is helpful to have our weaknesses pointed out if we are wise enough to profit thereby.

Nimble Draughtsmanship.

We have had so much of draughtsmanship, sometimes with very little behind it, that great facility has got rather into disrepute. The mind is sometimes better employed when the fingers are not too nimble; nevertheless the power to draw and to express your ideas with the pencil is one of the happiest endowments of the architect, and should be assiduously cultivated. There should be a careful avoidance of tricky methods, for we have seen drawings so pretty in themselves that the absence of good design is overlooked; the drawing is looked upon as an end, instead of being a simple medium or a diagram of the proposed building.

It is curious to look back on the fashions that have prevailed in my own time. When I was a pupil most perspectives were coloured, and there was a small income for many who were adepts at a skilful throwing-on of colour; then George Street, Norman Shaw, and Eden Nesfield showed how much of the real qualities of a building could be expressed by line. One incident of the time was the discovery that one of these masters used a notched straight-edge, thereby admirably rendering the texture of roofs. I confess to having sacrificed a T-square myself in that cause. Light and shade, whether with line or the brush, are desirable to explain fairly the shape of a building. There was a pretty and telling way of leaving roofs and spaces white, as if under snow, with strong black touches here and there, the result being effective but not a fair rendering of the future structure. In one of my wanderings I met a nice young man who proposed making a study of art; I am not sure that he could draw, but he was interested in some blue and red chalk with which he touched in passages of his work: he found this treatment in the studies of the Old Masters to which he desired his sketches should approximate. If you have the power of drawing, it matters very little by what vehicle your thoughts are told, and all tricks are a hindrance to truthful expression. A method that obtained lately among the younger students was that of running the lines out beyond their natural limit, thus giving to a cornice or a stringcourse an unreal weight and importance instead of defining its contour. This may look brisk and sketchy, but a student's time is not very valuable, and a further half hour would be well spent in making the drawing correctly explain its parts. Do not be afraid of being methodical and exact, rather than sketchy. Nothing is more offensive than "sketchy" passages from a hand without the artist's mind, impressionism which is only scribble.

Bushy-haired Bohemianism.

Fortunately Bohemianism has ceased to be a distinguishing mark of the student, for I can remember when nearly every Academy student wore long bushy hair; I am not sure whether I did so myself; I could have done so then. I see among you now men of fashion, with the greatest correctness of costume. Still I would say to the serious student do not be so beautifully dressed that you cannot carry a sketchbook or a two-foot rule in your pocket. You should be so far ready for work that the eight o'clock dinner, for which you must dress, is not always imperative. Michael Angelo, during a fifteen hours' spell of work, was content to munch bread; he slept little, finding that sleep made his head ache; he said that though he had made himself rich by his work he had lived always as a poor man. We may not all, like this giant, bring the mind to dominate the body, but I am sure that simplicity of life is to be aimed at by the true artist. You are fortunate in having your great interest in life; you have no need of the expensive pleasures or distractions that save the gilded youth from being bored. Much good work has been done in a garret, and I believe that the admirably appointed young man finds it less easy to throw his soul into his work than does one to whom Art is the companion and solace. I would not have the artist a drudge; variety, good company, and recreation are necessary if the work is to be a pleasure. It is essential also to move among men and to make good friends, for it is no use being a good architect if you have not a client to bring the work. Accept week-end invitations—and, if you can, interest your host in a clever suggestion for altering and beautifying his place.

I hope with most of you that your art is sufficiently interesting to be the purpose of a holiday, whether in getting away on a Saturday or taking ten days in Brittany. They will tell you that you want relaxation from work—golf, perhaps, or a lounge in a house-boat. From my own experience I would say there is more change of thought and of interest for the mind in seeing and assimilating fine things, living out of doors all day, sketching and measuring with a change of scene, of climate, diet, and language. Our own beautiful country will supply matter enough for study, but crossing the Channel I have found to make a more complete break with the life of the office.

The Disciples of Norman Shaw.

I suppose, without question, in the period that my memory covers, Mr. Norman Shaw has been the most followed, I might say the most copied, through the successive phases of his work; for the strongest men will always have a large following of those who imitate their manner. I value to this day the several books I managed to buy out of my youthful allowance, and among these are the sketches of Shaw and Nesfield. In

their exposition of the architecture of France the examples chosen are all Mediæval, later work was not accounted of in those days.

Waves of Fashion.

I remember, in my own early visits to France and Spain, regarding the Renaissance screens in the churches as wicked innovations, although fascinated by them against my judgment. A chateau of Louis Douze or of Francois Premier was a rich find, while a work by Mansard or Vanburgh we counted ponderous and dull. By common consent we now seek the more formal examples of buildings, and what was once dull we find dignified and restrained; while some will tell us that the quaintly picturesque, our first love, is hardly to be taken seriously as architecture. Unquestionably the student should study the purer classical works, rather than the picturesque Jacobean or Dutch versions, or perversions, of the same. There was an earnest attempt to gather up the traditions that were snapped in Tudor times; now the prevailing desire is to revive the later methods that had become traditional here until the advent of chaos; and in this last is our best chance of arriving at a happy unity of aim.

We may be disturbed again by waves of fashion, for no arbitrary law exists in matters of taste. There are Eastern races with a really fine sense of beauty, as shown in their splendid arrangements of colour and in their gorgeous stuffs; yet, among these, a lady can make no claim to beauty unless she is fat. Our standard differs from theirs and our taste is more catholic; yet it is difficult even for the most cultivated to keep an open mind for the appreciation of what is fine if it is not in vogue.

It is unnecessary to insist on the advantage of wide knowledge and of general culture. Avoiding the purely archæological spirit, History is perhaps the most interesting subject and the most sympathetic with our central thought or study. The world's history is written in its architecture, and it is a part of our schooling to follow the developments and to trace the growth of the various methods of styles, noting the influence of one country or people upon another. Our interest is less in the names or in the characters and peculiarities of kings than in the work that was accomplished in given periods and in the great masters of the Arts that such periods produced. If a name or a date is mentioned, we can localise it by calling up the Byzantine, Mediæval, or Renaissance environment of the subject; it makes the past very real to us. The knowledge of foreign tongues is an invaluable aid to the architect. Through my own indolence in acquiring or in keeping up my knowledge of these many precious books are closed to me; while in travelling one is often surrounded by people with whom the exchange of ideas and even the gentle amenities of life are difficult.

Niceties of the Notebook.

I have spoken of the study of fine buildings and of the use and misuse of the notebook, which we like to bring home full of pretty things. In our search for the latter we may possibly miss what is noblest in architecture. The sublime is not readily transferred to the sketch-book; it is no use making picturesque jottings of the Parthenon or the Pantheon. Those who have great facility with the pencil find less effort in the use of the fingers than in the exercise of the mind.

Drawing, to which I give a high place, may at any time become a snare, being made a substitute for contemplation and analytical thought, the seeking out of a reason for the forms we see, learning whether they were determined by the necessities of construction or were evolved as a part of a beautiful composition.

My fellow-workers may expect of me some remarks about water-colour sketching, which has always been my happiest recreation. Under favourable conditions of climate, with a sympathetic friend, a day spent with the brush in a spot selected for its beauty is as good a time as I can well imagine. The travelling student may wisely turn to brushwork for relaxation from the more exacting forms of study. We architects do not sufficiently consider the value of colour. We think of form, and perhaps light and shadow; too often conceiving a scheme in elevation only. One who paints must consider buildings in perspective, also taking account of their colour and their relation to surroundings. Yet of the student who is good enough to obtain an architectural prize from the Royal Academy or from our Royal Institute I would beg that he stick to his trade. Let him not, because he finds that he can paint pleasantly, throw architecture aside, however great the difficulties to be faced, before palaces or cathedrals are entrusted to him.

What of Photography.

I have spoken of drawing and painting: what shall one say of photography? The art, or shall we say the science, brings to the eye all that is finest from all parts of the world—Indian temples, Venetian palaces, Eastern minarets, the sculptured doorways of great cathedrals, and these often taken with judicious lighting. By photographs or photo-prints memories of the world-treasures are brought to the armchair. As affects the student this is a doubtful advantage; that which he attains without effort is hardly a possession; he had better worry himself for hours making an indifferent drawing than secure the best of photographs or of book illustrations of his subject.

In the last few years choice books have been added to our architectural libraries: the subjects, admirably selected by men of judgment, especially setting forth the beautiful houses throughout our own country. These we value while urging the student not to misuse them or make them an excuse for shirking the prosaic work of measurement and personal study; he is apt to be distracted by the quantity of material ready to hand and the many inventions presented to him, hardly leaving him the chance of originating. There is also the handy "kodak," by means of which he could snapshot that which would take a day to draw. We accept these things with our advanced civilisation, while we question if art is advanced by photography any more than music by the marvellous gramophone.

Study and the Application.

We have discussed the methods of study; how can the acquired knowledge best be applied or tested? I think there is no more useful exercise than to enter heartily into these competitions for medals and prizes. Doing so you are for the time being the architect to a palace or some monumental work with grandeur and scale to which you may perhaps never have the chance of building; but whether the prize falls to you or another, the benefit of the effort remains yours. Again, a little later, you begin for yourselves, and confiding relations entrust you with an additional wing, stables, or a motor-house. Your time is not filled up as it should be, and it is worth your while to take your two-hundredth chance in competition for the exercise of your imagination, and powers of design; it is valuable training. The open competition is a quite unreasonable venture if looked upon in any other light than this; a multitude doing the work for which one only is commissioned.

The Prize Drawings.

This evening is the first occasion on which the prize drawings have been with us during the address to students and the review of their works; a discriminating friend will presently discuss the latter critically and in detail. [See Mr. Waterhouse's criticism in last week's Journal.] I will only say that the competitive drawings reach a higher level this year. Some of those that escape mention might have carried off a prize in some previous competitions. There is not only good draughtsmanship, but in some cases evidence of design and composition, with an effort towards the "grand manner."

As we have said, there are fashions in our art and they influence the student. It is interesting to note that whatever the subject set, whether the "Landing Stage," the "Corridor of Shops," or the "Pavilion," a dome of noble span is a leading element in the designs. Perhaps domes may become features in the architecture of the future; during my own career I have not been allowed the opportunity of raising a dome.

We have discussed methods of study and modes of working and drawing, but we must keep well in mind that these are but preliminary steps and stages. Looking on our great Cathedrals and the noble monuments of the past, we must remember how little they owe to draughtsmanship. No beautiful drawings, such as we see to-night, preceded the building of Westminster Abbey. The master mason chalked out indications of what was to be, and such lines were followed with more or less accuracy, slight inequalities giving a charm to the whole. It is pleasant to come upon elevations or studies for buildings by the great masters, but these, as drawings, would not pass muster with those before us to-night. We judge the embryo architect by his drawings, and it is generally a fair test of his worth. Yet we would remind him that to use art and science in Building is his vocation, and there is none higher.

A poet has said:—

To build! to build!
That is the noblest art of all the arts.
Painting and sculpture are but images,
Are merely shadows cast by outward things
On stone or canvas, having in themselves
No separate existence. Architecture
Existing in itself, and not in seeming
A something it is not, surpasses them
As substance shadow.

Our Plate.

Banking and insurance corporations provide our towns with their most strikingly handsome and sumptuous buildings, and the Sun Insurance Office, Lowgate, Hull, shown in our centre plate, does not fall short of that description. If it is thought that the elevation is somewhat bold and aggressive, it must not be forgotten that, after all, business premises should not err on the side of shrinking modesty. Mr. Jacobs has at all events produced a handsome and striking front, and this effect is obtained without excessive elaboration of detail.

After a heated discussion, the United States National Board of Trade has appointed a special committee to urge Mr. Root, Secretary of State, to incorporate in any treaty the Government might be about to conclude with Great Britain some provision for the protection of American patent rights. A deputation from the Board has called at the State Department last Thursday to protest against the British Patent Law, and was informed by Mr. Bacon, Assistant-Secretary of State, that the matter would be referred to the House of Representatives' Committee on Ways and Means.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Feb. 20	GUILDFORD. Footbridge over the River Wey. Designs are invited for a light footbridge in oak or other materials. Particulars from C. G. Mason, C.E., Tuns Gate, Guildford. Designs to be sent to W. Shawcross, Hon. Sec., 108, High Street, Guildford.
Feb. 20.	PENCLAWDD (WALES). Chapel. Plans are invited for a new chapel to contain 800 seatings. Approximate cost of chapel, including heating and acetylene lighting apparatus, £3,000. Premium—five guineas to the architect whose plan *the Committee may select.* Plans to be deposited with John Rees, Secretary, Penian, Penclawdd, S.O.
Mar. 1.	TORRINGTON (DEVON) Memorial Cross. The Committee of the Rolle Memorial invite designs for a memorial cross (preferably of granite), to be erected in the churchyard, Torrington. Cost, inclusive of erection, &c., not to exceed £100. Premium £2 2s. for the selected design, but no other charge or expense. Particulars from George M. Doe, Town Clerk, to whom designs are to be sent.
Mar. 8.	*PONTARDAWE (WALES). Offices for the Guardians, in Holly Street. Premium £10 10s. The premium is offered by the Guardians "for plans with abridged specification, *which in their judgment* are best suited." Particulars and conditions from C. B. Jenkins, Clerk, Herbert Chambers, Pontardawe, S.O., Glamorganshire.
Mar. 17	†NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3,500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council. Stanley S.O., Co. Durham.
Mar. 31	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days.
No date.	BLACKBURN. The Blackburn Small Holdings and Allotments Committee have decided to invite architects and surveyors in the Borough to submit competitive plans for the laying-out of the estate at Oswaldtwistle, recently purchased for small holdings. Premiums of £25, £10, and £5 are offered.

*We are advised by Mr. Jenkins that the supply of particulars and sketch plans is exhausted and no further applications can be entertained.

†The Royal Institute advises members not to compete.

Offices for the Stanley U.D. Council, Durham.

Messrs. Speir and Beavan, of Cardiff, have forwarded to us the following further correspondence concerning the above, which we think requires no comment:—

Mr. Joseph Routledge,
Surveyor,
Council Offices, Stanley,
County Durham.

New Council Offices.

January 29, 1909.

Dear Sir,—We are obliged for yours of 28th inst. in reply to ours.

We shall not, of course, compete, neither do we think you are likely to obtain designs from any architects of standing with the conditions you issue.

Yours faithfully,
SPEIR and BEAVAN.

Stanley R.S.O.,
County Durham,
January 30, 1909.

Messrs. Speir and Beavan,
Architects, etc.

Re New Council Offices.

Gentlemen,—I beg to say in reply to yours of the 29th inst. that we have no less than sixty architects, who have paid their £1, and got the block plan of the site, and out of the society there are some of the best architects in the north and south of England, and some of them members of the Royal Institute of British Architects.

Yours faithfully,
JOS. ROUTLEDGE,
Borough Chambers,
Wharton Street, Cardiff.

THE TOWN HALL, HARRISMITH, NATAL. PRINCIPAL ENTRANCE. PRICE AND AGUTTER, ARCHITECTS.

Blackpool Central Library.

Mr. G. H. Willoughby, F.R.I.B.A., of Manchester, the assessor, has delivered his award in the above competition, as follows: First: Messrs. Alexander Cullen, Lockhead and Brown, Glasgow. Second: Messrs. Russell and Cooper, London, W.C.; Messrs. Thompson and Bristow, Stamford Hill, London; Messrs. Cooper and Slater, Blackburn; Mr. C. H. Potter, Manchester; Mr. H. R. Gardner, Leatherhead. One hundred and forty-two designs were sent in. The assessor suggests that the whole of the premium money, 100 guineas, should be disbursed equally among the five designs next in order of merit to that placed first, and recommends that the authors of the first-placed design be entrusted with the work. The Free Libraries Committee have agreed to these recommendations.

Cornwall County Offices, Truro.

Mr. Fellowes Prynne, F.R.I.B.A., has delivered his award in the above competition as follows:—

1. Messrs. Silcock and Reay, Bath.
2. Messrs. Pearson and Milburn, London.
3. Messrs. Warwick and Hall, London.

We take the following particulars from the meeting of the Council reported in the "Western Morning News." In regard to the proposed new county offices, Mr. Fellowes Prynne, the assessor, reported that he had made a careful inspection of all the 59 sets of plans. In view of the unfortunate conditions in the particulars sent to the competitors, there was a very large divergence, both as regards the extent of the plans and the character of the designs generally. Consequently, the variations in the estimated cost was very large, and for that reason the work of the assessor became far more difficult and complicated. The variations between the lowest and highest estimates

given by the authors of the designs, which attempted to comply with the regulations, was no less than £32,000, the highest being £45,000 and the lowest about £13,000. It was sufficient to say that in the latter the estimated cost given was most unreliable. Several of the designs sent in were of the highest merit, but in most cases due regard to the question of cost had not been observed, with the result that many otherwise good designs had to be set aside as extravagant in plan and detail. He trusted the Council would accept his decision as final, as he was convinced that course would be not only in the interests of the Council, but more satisfactory to competitors, and it would prevent any suspicion or discussion as to the fairness of the competition. To No 43 he awarded the first place, first on account of general completeness and convenience of the arrangements of the plan; secondly, the grouping of the several departments on distinct floors and in blocks; thirdly, the arrangement of the Council Chamber and surrounding committee and other rooms used by the Council; and fourthly, the complete and self-contained arrangement of the caretakers' rooms. The estimate given by the author of the design might be considered approximately correct. No. 2 was awarded second place, and No. 38 was placed third.

Mr. Buller Howell moved, on behalf of the Offices Committee, that the report of the assessor be adopted, and that if the Council saw fit the present committee be continued in office to carry on the work. The envelopes containing the names of the successful competitors would be opened in the Council meeting.

Mr. Wakefield: May we have the estimated cost?

Mr. Coon thought it was preposterous to ask the Council to sanction any scheme without letting them know what the cost was likely to be.

Mr. Fellowes Prynne stated that the estimate of the first design was £19,861 with the Council Chamber or £16,261 without the Council Chamber; the estimate of the second design, £24,345; and of the third, £23,854. The cost of the lowest estimate of £13,000, when it came to be cubed up, had to be raised to something like £20,000. The prices were merely for the building, and did not include the boundary walls and the architect's commission.

Mr. Coon: The least expenditure capable of providing buildings is £19,191 then.

The Chairman: I think of all the plans, this one, if it is selected, is the cheapest.

Mr. Hosken: Are we committed to the policy of spending £20,000 for the erection of county offices? I have no recollection of anything of the kind coming before the Council, but before we launch on a scheme of that kind the vote of the Council should be taken.

Mr. Buller Howell said the Council committed themselves to getting a piece of land near the railway station—which they got—and to asking for competitive plans to see what the cost would be if the Council chose to build for the accommodation required. He did not think that beyond that the Council committed themselves.

Mr. Fellowes Prynne said the plans put before them were made in accordance with the conditions issued by the committee, specifying certain rooms of certain areas to be occupied, various apartments to be arranged. The one chosen was really the best arranged of any; it complied in every respect with the conditions, and certainly was by far the cheapest of those which complied with the conditions. As far as the conditions went, he did not really believe it would be possible to make a plan more economical. As a matter of economy in planning there was absolutely no waste in corridors and things of that kind.

Mr. Tyacke: What is the present cost of offices in the county?—A voice, £150.

Mr. Buller Howell said additional accommodation was almost necessary at once, and the lease of the present offices in Truro would run out at Christmas next year.

Mr. Tyacke: It means that the new offices will cost £1,500 a year.

Mr. Buller Howell: We calculate £1,200—a farthing rate.

Mr. Coon: The new offices will mean an annual charge ten times greater than we are paying at the present time.

Mr. Carkeek said it was not in keeping with the county that they should be beholden to the Corporation of Truro for rooms to hold their meetings. The least that could be done was to house those who were willing to sacrifice their time and ability to the interests of the county.

Mr. J. C. Williams: Is the Council finally committed to having new offices?

Mr. Buller Howell said there was no obligation on the Council to accept the plans of the successful architect, but if no action was taken on the plans in twelve months a further £50 would be due to the architect who was placed first.

On the motion of Sir Francis Layland-Barratt, the Council accepted the report of the assessor so far as it affected the award of the premiums to the successful competitors.

THE TOWN HALL, HARRISMITH, NATAL.

The buildings, comprising Town Hall, municipal and departmental offices, Public Library and Market Hall, were built at the cost of over £26,000. The architects were Messrs. Price and Agutter, of Maritzburg.

The new Town Hall is treated in the Renaissance style of architecture, being built of red brick with facings of local stone. The frontage of the Town Hall is 112ft., and the buildings extend back a depth of 194ft., the Town Hall block being alone 130ft. in depth. The height of the parapet of the main building is 36ft. above the ground floor, and the pediment surmounting the portico—which is a feature of the facade—reaches to the height of 44ft. and is surmounted by a flagstaff.

The vestibule is paved with marble, and the four columns, with their frieze and cornice over, will form an important feature here. Glazed teak swing doors admit to the lobby leading to main crush hall, which is paved throughout with marble tiles, and ornamented by twelve pilasters, the shafts of which are in selected Cippolino marble.

On the left or Southey Street side of the buildings on the ground floor are placed two retiring rooms, in connection with the large hall, and the Public Library, with its lending department and public reading and reference rooms.

The large public hall, the dimensions of which are 72ft. by 51ft., provides ample public accommodation for dances, concerts and theatrical performances in the town. The floor is in maple and the walls and plaster enrichments throughout are finished in Umzimkulu lime plaster, with main frieze in Cordilova, and gallery fronts in same material painted suitable tints. The hall is lit by clerestory windows in wrought-iron, with leaded lights, and the main barrel ceiling over the hall is carried out in Umzimkulu lime plaster. The seating accommodation, including that of the galleries, is for 850 people.

On the first floor, Bester Street side, is the Council Chamber and reception or banqueting rooms, divided by a large folding mahogany partition 16ft. wide by 12ft. 6ins. high, which, when opened, will convert the whole into one large apartment 62ft. by 19ft. 6ins. on the occasion of important functions or ceremonies such as receptions, banquets, etc., a service room being provided in connection therewith, having direct communication with the kitchen by means of lifts and a suitable storeroom with necessary cupboards. On the main front of this floor, on the right, is the Mayor's parlour, communicating with the Council Chamber, and on the left a large committee room.

The rooms on the Southey Street side are a museum and picture gallery 39ft. long by 19ft. 6ins. wide, and four rooms accommodating the Town Engineer's department.

The Central Market Hall is 66ft. long by 48ft. 9ins. wide, and is entered on three sides from the verandahs through sliding doors. Accommodation is provided in addition for five separate lock up stalls, averaging 12ft. by 11ft. each. The openings to these stalls are provided with steel roller shutters. In addition, a separate office is provided for the Market-master, with a fireproof safe and iron door. Under a portion of the market is storage cellar 60ft. by 23ft., with an iron staircase leading from the yard and a lift communicating with the market floor.

The erection was carried out under the supervision of Mr. E. A. Agutter, A.R.I.B.A. Messrs. Kelly, Anderson and Co., of Johannesburg, were the contractors, Mr J. Kelly being their representative. The clerk of works was Mr. B. Benson.

PLANNING OF SCHOOLS.*

By H. T. Buckland.

Peculiarity of English Schools.

In the daily time-table of both the elementary and the secondary school there is an assembly each morning before dismissal to class-work; this gives rise to one of the important differences between the plans of schools in this country and those of America and the Continent, viz.:—the relation of the assembly hall to the rest of the building. In the majority of our schools this occupies an important position, due mainly to its frequent use; in America and on the Continent it is usually placed on an upper floor and comparatively out of the way, owing to the fact that a daily assembly is not the rule, as the children enter the school and go straight to their class-rooms. For this reason we find many of these schools planned with a cloak-room in connection with each class-room.

Board of Education Rules.

The rules of the Board of Education to be observed in the planning and fitting up public, elementary, and secondary schools of necessity influence all planning so considerably that it is not possible to proceed very far without a reference to them, as they are the guide to which all authorities (upon whom the burden of providing school accommodation rests) are compelled to defer when arranging for the erection of a new building; rather, however, than discuss them *seriatim* I should prefer to consider their practical application. Let me assume for a moment that an Education Authority in a large town has to erect a new school, and is about to instruct an architect to prepare plans. What are the points upon which the latter will need to be informed?

1. The number of children to be accommodated. 2. In what number of departments the school is to be planned. 3. Is the building to be planned on one or more floors. 4. What numbers are to be accommodated in each of the class-rooms.

Site and Aspect.

I have assumed a site has already been chosen, as in large towns sites have frequently to be purchased long before a school is required, so that in many cases the architect who is eventually employed to erect the schools cannot be consulted. Where, however, this is possible, it should certainly be done, as the question of aspect is an extremely important one. We have, many of us, I dare say, been faced with the problem of planning a school to go on a long narrow site, with its short axis north and south, and an absolute instruction to get the majority of the class-rooms on the south side; no easy matter if the school is to have central halls, and the length of the site is comparatively limited. It is true in a large town that one is not able always to choose a site with the *best* aspect, for the simple reason that there is not one to be had; in that case obviously any instructions with regard to the aspect of class-rooms should be very general in character.

---

*Extracts from a paper read by Mr. Herbert T. Buckland before the Architectural Association on February 5th.

Preliminary Points.

I will now return to the points upon which I suggested an architect would need to be informed before commencing to plan a school, and consider them in the light of the Board of Education's requirements. Dealing first with elementary schools, my first two points together. Number to be accommodated, and in what number of departments. What does our guide say? "No school should ordinarily be built to accommodate more than 1,000 to 1,200 children in three departments. No single department should accommodate more than 400 children. A large school in three departments might conveniently be divided in the following proportions:—Boys, 360; girls, 360; infants, 380." It goes on to say: "In departments of this size, the most suitable plan is that of a central hall, with the class-rooms grouped round it." Now, it is obvious from this instruction that a school with three departments if planned as suggested must have three central halls, unless advantage is taken of a further instruction, which says: "A single central hall may be provided for the joint use at separate times of two departments, provided that it is so placed as to be readily accessible from the class-rooms of each department." There may be many examples of scholars where this condition has been taken advantage of. The only one I am personally acquainted with is at Darlaston. In this school, one hall is used for three departments. Now, although a three-department school may be the most efficient, it is also the most expensive both to build and to maintain, as a head master and two head mistresses have to be employed. Either this fact, or a preference for a mixed school, has led to the building of schools in two departments instead of three, viz.:—an infants' and a mixed department, whether with a view to economy or the preference already suggested, I am unable to say. If the latter, the plea is certainly justified by the Continental and the American practice, as mixed departments are the almost invariable rule both in America and on the Continent. And in Great Britain it may be said that as we go further north the mixed school gets more common, and in Scotland is almost universal.

Number of Floors.

The next question upon which we have to seek enlightenment is whether the building is to be planned upon one or more floors. Upon this point our guide says: "Where the site is sufficiently large, open and fairly level, the most economical plan is that of a school on a single floor. Such an arrangement is also preferable on educational grounds. In any case it is desirable that a school building should not be on more than two floors. A building on three floors is open to many objections, and should only be proposed in special circumstances or on very costly sites. This recommendation has, I think, been very widely adopted throughout the country; and in Birmingham no elementary school has for many years been erected with more than one floor.

Then as to the numbers to be accommodated in each of the class-rooms, after suggesting the sizes of the departments—boys, 360; girls, 360; infants, 380—the rules go on to say: "As a rule, such a department would probably require seven class-rooms." This would give us six for fifty each, and one for sixty, in each of the upper departments; and four for fifty, and three for sixty, in the infants' department.

Size of Class-rooms.

Education authorities and head teachers in elementary schools are, I believe, fairly generally agreed that a class of fifty children is all a teacher can efficiently teach. The need for class-rooms accommodating sixty is chiefly to provide for the classes at the beginning of the educational year, as they are always larger then than at any other time, and only gradually drop to the average.

These, then, are the main points to which consideration must first be given in the planning of all elementary school buildings; I will now show one or two examples illustrating various methods of dealing with them. I think there can be no question that a central hall is undoubtedly the best for an elementary school, as it affords excellent means of supervision and convenient access to class-rooms, and although schools have been recently built with an enlarged corridor which might almost be called a central hall, the examples I propose to show all have the marked characteristics of a genuine hall.

Different education authorities have different views with regard to the erection of a three-department school one one floor. We shall find some prefer all the departments in *one* block, others in *two* blocks (the infants' department being the one usually kept separate), and in some cases a preference appears to exist for each department in a separate block.

The *pros and cons* may be briefly summed up as follow:—A building in one block is more economical to erect; can be heated from one centre, and is consequently cheaper to maintain.

CONTRACTORS' SECTION.

THE DECAY OF APPRENTICESHIP.

In our issue of January 13th, we touched on the causes which have brought about the decay of apprenticeship, and suggested that, the question being one of national importance, ought to be dealt with on a wider basis than has hitherto been attempted.

We propose now to examine the question further, to see whether any broad lines of treatment can be suggested.

Hitherto the replenishing of the gaps which naturally occur in the rank and file of those engaged in trade and commerce has been left to the private initiative of those seeking a career and of those requiring workers.

The modern methods of production have admittedly acted adversely on the method of training the new industrial recruits by apprenticeship, both in this country and elsewhere. The question is: How shall industrial training be given under the new conditions? The matter needs considering from several aspects.

The General Point of View.

There is the general point of view, that it is essential to the continuance of our national welfare that every young person in Great Britain, broadly speaking, should be given a training which will enable him or her to earn a livelihood in some branch of industry or commerce, or in some profession, and that the efficiency of such training is equally a matter of national concern.

At one time, primary education was regarded as purely a matter for private initiative also, but now is rightly considered a matter of national concern. Secondary education is travelling rapidly in the same direction, and these two provide for the training of the young up to a certain point.

In view of the need there is for maintaining our national productivity at the highest level of efficiency; in view of the way the unemployed problem grows in magnitude through the growing excess of unskilled workers; and in view of the admitted defects in present methods of apprenticeship, it does seem that the next step should be the adoption by the State of the broad principle that the education of the children of the nation must be considered a matter for State supervision from the time they enter the primary school until they emerge from an apprenticeship able to earn their own livelihood.

Then there is

The Point of View of the Employer.

To the employer, the worker is in a certain sense a human productive machine, differing in kind, but hardly in principle, from the machinery which now plays so important a part in production. The employer wants the most efficient workers possible of their respective kinds, and he can hardly fail to recognise that it is as much his business to provide himself with efficient workmen as it is to have efficient machinery. Efficient workmen do not grow, however, they have to be made, and therefore it is the employer's duty to make them through apprenticeship, or some substitute for it. Employers probably recognise these facts in a general way, and many of them take some trouble to make apprentices, but the system of "laissez faire" which prevails in regard to making, training, and controlling apprentices, causes employers to avoid the responsibility, unless there is something clearly to be gained by employing the cheap labour of apprentices. This last motive is not a healthy one for the system, however; the whole legal theory underlying apprenticeship indentures is opposed to the exploitation of apprentices in that way.

Moreover, it antagonises the adult workers, which is detrimental to progress on the part of the apprentice. Employers' associations fully recognise the importance of this matter, but can do little beyond calling attention to it as things at present stand.

If, however, it became the duty of every employer to contribute to a national apprenticeship training fund, such fund to be assisted by Government grants; and if, although no employer was compelled to take apprentices, yet, those who did so experienced a relief in the amount of their contribution, a very different state of things would quickly come about.

If the administration of such a national fund was in the hands of representative committees elected from employers, workmen, and Government nominees, an economical organisation for the training and supervision of apprentices could be created.

The system of Government grants enables a proper control and direction to be given to the system.

It is not suggested that such a scheme should interfere with existing trade schools, technical schools, and the like; the suggestion is aimed entirely at providing apprenticeship training in the shop, works, office, etc. There ought not to be any serious difficulty about tuition if the services of the older workmen were utilised to act as teachers in the respective shops; a moderate remuneration would enable this to be done, and a further period of usefulness to open to men who are past their prime or have sustained accidents, while the valuable experience of the elder men would be imparted to the rising generation instead of being largely lost as it is under the existing lack of system.

There also is

The Point of View of the Young

and of their parents. In regard to the children, their welfare would be greatly promoted by the age at which they are permitted to leave school being raised from 14 years to 16 years of age. The latter age is quite young enough for entry into business life, and we believe employers generally prefer not to take apprentices until they are 16 unless they are exceptionally well developed.

There results a lost period between 14 and 16 which is often filled by youths acting as errand boys and the like, and seems largely a wasted time.

Again, there is no commoner experience than this, that a man finds when he reaches full age that he has chosen the wrong occupation and wasted his time in trying to learn a trade for which he was not fitted by natural capacity.

This waste of time and energy might be mitigated if the young people in the last two years of school life were given opportunities of seeing something of the kind of work they contemplated becoming apprenticed to. It is related of the celebrated Dr. Franklin that when he had finished school his father took the boy on a round of visits to the various workshops in Philadelphia and allowed him to see and say which he would prefer, and that as a result, printing was chosen, with every satisfaction in the outcome.

In regard to the parents, the principal difficulty is a financial one; they would like their children to stay longer at school and to learn a trade, etc., properly, but do not see their way to afford it; also, the wages earned in the earlier years by apprentices compare unfavourably with those of office and shop boys and the like.

The smaller earnings of junior apprentices is partly due to their starting at 14 instead of 16 years of age; the employer considers them not worth much for the first two years. This would cure itself to a great extent if the children remained at school until 16; they would be better developed both in mind and body, and if placed at once under the better tuition suggested, would quickly be worth a good deal more than they are under present circumstances, and more than could be earned by errand running and the like. There remains therefore only the question of the two years longer at school.

It is clear that the time is coming when children whose parents are unable to feed and clothe them enough to enable them to receive primary education will have to be assisted in these respects for humane reasons, and because it is in the National interest that this should be done, and the same argument would extend the assistance a little longer without much difficulty. It is probable that the amount of assistance required would tend to diminish after a couple of generations, because it is reasonable to expect that with better education and proper industrial training the causes which now make assistance necessary would largely disappear. From

The Workman's Point of View

the suggestions herein made could hardly fail to be beneficial; workmen's organisations have to provide funds for much unemployment, due to lack of early training or to premature superannuation on the part of their members; the better educated, the better trained the workers are the more intelligently will they be able to use their organisations to improve their lot, and the more intelligently the workman's organisations act the less hurtful are they to either employers or the community.

The opportunities, under such a scheme as is here suggested, for employment as practical teachers in the workshop, ought to prove very acceptable and help to solve a very knotty problem which is at present exercising the workmen's unions.

It would appear therefore, that, looked at from the standpoint of each of the parties concerned, the suggestions we have put forward would confer substantial advantages and solve satisfactorily the question of apprenticeship.

What is the Alternative;

for we take it the present methods must ere long give place to some better way.

The alternative is a large development of technical schools of various kinds, with consequent increase in the time youths will have to spend in learning their trades without being able to earn money meanwhile; this means a great increase in cost on account of the expensive buildings and teaching staff required; and the result cannot be so satisfactory, for all who have practical knowledge of this question will admit that the technical school training is no adequate substitute for the training of the workshop and the office.

Conclusion.

Whether, therefore, we look at this question from the side of efficiency or from the side of cost, a scheme on the lines we have indicated, where the control of the instruction to be given is kept in the hands of those who best know what is wanted, and who are most interested to see that the right kind of instruction is given and most concerned to see that no undue expense is incurred, must prove the most satsfactory and successful in every way.

Mr. Thomas Brock, R.A., has now practically finished the plaster model for the statue of Sir Henry Irving, and all that now remains, therefore, is the casting of the figure in bronze, which is, of necessity, a matter of time. It is hoped that the statue will be erected on the site arranged for it at the back of the National Portrait Gallery in Charing Cross Road, during the autumn of the present year.

NOTES ON PAINTING AND DECORATING.

Wall Paper.

The best sample books of the wall-paper manufacturers' new patterns just issued are rather interesting this year, as indicating the popular taste in mural decoration. Happily there is a considerable increase in the number of what one may term "adaptable" designs—that is, wall-papers which are produced in such a way that they may be used in different ways according to the size of a room. This is effected by supplying various borders, bands, etc., which are used for panelling, and by carrying the same system further in the frieze by providing the principal object of ornamentation with "extension pieces," which may be cut down according to requirements. By these means the objectionable feature in wall-paper decorations so frequently met is done away with, and this objection is that in many cases it is almost impossible to avoid prominent pieces of ornamentation, which "go round a corner," thus utterly destroying its ornamental character. With this new system it is easy for an ingenious decorator to place say, five of the principal centres of ornament of the frieze along the wall, and four on the wall at right angles, these being slightly further apart. Another feature noticeable in the new patterns is the many "cut out" designs. Instead of adhering strictly to horizontal lines, top and bottom in the frieze, there are many patterns now to be had which are expressly made to be cut or scolloped out, and this gives a much better effect. But after all there is nothing new about this system, except that it is once more brought to the front.

There is an increased number of Early Victorian papers, and a marked falling off in ingrains, doubtless due to the fact that this class of paper, although it gives an excellent background for pictures, and from a decorative point of view is in many ways satisfactory, yet is not always entirely beyond suspicion with regard to the quality of permanency.

It is interesting to observe also the change in colour in many of the patterns from year to year, and equally interesting to observe how the taste in decoration seems to run in cycles, hence the present demand for Victorian patterns.

It is not so many years ago since strong colours were mostly in demand, with ornamentation either of a strictly conventional and frequently rigid and ugly style, or of a pronounced effect which was equally objectionable. Then we came to find the prevailing colour a muddy class. Now we have arrived at something much better—that is to say, really delicate colours, suitable for drawing-rooms furnished appropriately, rich colourings in bright designs for large halls and places of public resort, which are bold enough to bear them. We have also a number of actual or realistic effects, many of a very beautiful character in the shape of roses, sometimes arranged to climb over lattice ladders, so to speak, with large intervals of white between.

On the whole, it must be acknowledged that wall-paper designs taken in the aggregate are at present as far advanced as they have ever been, when the price (which must regulate such matters to a great extent commercially) is taken into consideration. Last year there was a great number of heliotrope and violet designs, but this year there are by no means so many. Probably this is due to the fact that such colours do not show up well by artificial light.

There is, however, an increased number of browns, ranging from rich chestnut to biscuit colours, and those in plain papers with appropriate hand stencilled friezes applied on the extension principle already referred to, permit of very charming decorations at a moderate cost.

Paints.

There is unquestionably an awakened interest among architects and builders as to the merits of zinc oxide and pigments other than white lead. Time was when the building trade from the highest to the lowest considered that the best paint was one necessarily made from pure white lead, pure linseed oil, and pure turpentine; indeed, this opinion prevails very largely to-day. Those, however, who have closely studied the subject of paints and painting, are aware that it has been fully demonstrated that while the paint named is an excellent one, which may be taken as the standard for work of a uniform character, yet it is by no means the "be all and end all" of paints. On the contrary, a paint properly made is one which is exactly suitable for meeting the conditions of surface to which it is to be applied, and the atmospheric or other changes which tend to cause its destruction. Thus it will be found that if we start on the white lead base we usually add other pigments to counteract the weaknesses of that lead, and it is here that zinc oxide is so valuable, because it is unaffected by sulphurous fumes, which, as is well known, turn lead black. Zinc is said to be brittle, white lead, on the contrary, has a tendency to "chalk"—that is, in time to get into a condition where it can be rubbed off with the hand. A mixture of the two, however, will cause one to strengthen the other, and it is here that the ready-mixed paint manufacturers score. They, knowing this fact, are aware that when the two pigments are very finely ground together with pure linseed oil an almost ideal paint is made for many purposes. This, of course, is a simple illustration of what is old truth, and the practical paint man knows that it is impossible to turn out a paint suitable for any or all purposes—as impossible as it would be for a doctor to prescribe medicine which would effect a cure for all human ailments.

Some of the best special brands of paints are good and durable, because the point mentioned has been carefully studied, but also because the manufacturers have recognised that it is not only to the pigments they must look, but to the binding liquids or materials—one must be varied according to the nature of the other.

It will probably surprise many readers when I say it is my opinion that one of the most durable and cheap paints—as far as durability is concerned—can be made by grinding together in an appropriate vehicle equal parts of best white lead, zinc oxide, and pure barytes. The last-named mineral is, of course, the well known adulterant of white lead, which is looked upon as generally having a terribly deleterious effect upon paint, but which is, as a matter of fact, absolutely inert, and therefore durable, but possesses the disadvantage of having little or no "body." This means that a paint made of the materials named might render it necessary to apply four coats instead of three, but if the cost of labour or length of time were taken into consideration, I believe it would be far cheaper in the end to give four coats instead of three of ordinary white lead.

Washable Water Paints.

It is only during the last twenty years or so that washable water paints have been known. Their advantages are so remarkable, and their use has increased to so great an extent that there is now hardly a prominent manufacturer of painters' materials who does not make also his particular variety.

The most convenient way to describe this class of material is to say that it is a half-way-house between ordinary distemper and oil paint. When two coats are applied—and it is rarely necessary to give more—a complete covering is given to a wall surface, and if the work is done by expert hands, there is absolute uniformity without the suspicion of a break or line between the various coats. There is no limit practically to the colours. Beautiful greens, blues, browns, and yellows, say, to the extent of a hundred or more different shades, hues, and tints, are stocked by all the principal manufacturers, and they are, as a rule, quite permanent, even when put upon new plaster, or, at least, such colours which are not fast under such circumstances are clearly differentiated from those which are considered lasting under such conditions. The price of a washable distemper may be taken at about one-half to two-thirds that of oil paint.

But it is not only in connection with the prime cost that there is an advantage in the use of washable distempers. In an ordinary room, say, for example, one which is used for public gatherings, a concert room, or a meeting place where ordinary wall paper would hardly be considered appropriate, the choice comes between oil paint, distemper, or a washable water paint. If oil paint is used, the trouble that is likely to ensue is that when the air becomes charged with moisture, as it is certain to do when meetings are held in the evening, there will be a condensation of moisture upon the walls, particularly at the top. The oil paint being non-absorbent, will cause this condensation to descend, carrying with it any dirt which may be in the atmosphere, and usually leaving nasty marks and streaks upon the walls.

When distemper is used exactly the same thing occurs, but with this difference, that the dirty and irregular mark becomes fixed upon the surface of the wall and cannot be removed, excepting by redistempering the whole surface.

In the case of washable distemper, the surface presented is, to a considerable extent, absorbent, yet not so much so as to prevent the surface being washed down and the effects of the condensation referred to being removed. From what has been said, it will be readily conceded that washable water paints are in many respects most suitable for the walls of public institutions, hospitals, workhouses, etc., and the beauty and refinement of the material cannot be too highly spoken of. It is not so long back since it was thought necessary, in order to properly decorate a place of resort to cover the surface of the wall with ornament, but happily this idea has to a very large extent been removed and most people understand now that the requirements of decoration insist upon a restraint in the use of ornament and particularly in the production of a restful and quiet effect. Even with these objects in view, it must be acknowledged that washable water paints have much in their favour. By their use one is enabled to obtain an absolutely flat surface, free from gloss, which is most valuable under certain circumstances, and particularly when irregularities in the surface of the wall would render the use of a varnished or glossy surface objectionable; and, of course, there is practically no limit to the ornament which may be introduced when washable water paints or distempers are employed, because the frieze, and, if thought desirable, the whole surface, can be stencilled with ornaments in appropriate colours. It should be mentioned here—and the facts cannot be too widely known—that a coat of a really good water paint under ordinary oil paint is an almost certain cure for blistering. I have known many cases of work specially exposed which have resisted all efforts at a cure, but which have never blistered again when the undercoat of washable water paint was applied.

An interesting triptych by Hans Memling (1425-1495), which was painted at Bruges about 1467 for Sir John Donne, of Kidwelly, Carmarthen, has been lent by the Duke of Devonshire to the Fitzwilliam Museum, Cambridge. There are, it is stated, only five other examples of Memling's art in England, two of which are in the National Gallery.

* * *

Of the sum voted by the United States Congress for the relief of the sufferers from the Italian earthquake, half a million dollars will be applied to the purchase of building materials, and the construction of 3,000 frame houses, which will be transported from New York in six vessels, and accompanied by several carpenters.

Bird's-eye View of the Residence and Experimental Ground, including the Museum and Workshops.

TRAINING SCHOOL AT ARCUEIL-CACHAN.

TRAINING SCHOOL FOR CONSTRUCTIONAL INDUSTRIES & PROFESSIONS AT ARCUEIL-CACHAN, NEAR PARIS.

In connection with the recent International Congress of Builders at Paris, mention has been made of a visit to an interesting school, which specialises in training for the building and other constructional trades. As it is claimed that this school is unique of its kind, it may be of interest to briefly describe its organisation, aims, and methods. The school is in two parts, consisting first of headquarters in Paris, where lecture courses are given by professors who are specialists. A list of 101 such professors is given. The second part consists of an institution situated about half an hours' journey from Paris, at the suburb of Arcueil-Cachan and standing upon a plot of about eight acres. Here are the director's residence, a large building used for the boarders, and a number of workshops and class-rooms of one storey, very cheaply, but suitably constructed, mostly by the pupils: a large portion of the land is left unbuilt upon to serve as a demonstration ground. For the morning courses, the students attend the lectures in Paris; for the afternoon, they attend the practical courses and do demonstration work at Arcueil.

The school consists of sections:—One, in connection with public works; a second in connection with building; a third deals with the applications of electricity; and a fourth with geometry and topography, as required in connection with the other branches. The teaching is divided into preparatory course (of 1, 2, or 3 years), and special courses. The special courses extend to two or three years, according to whether the student takes the full scheme of tuition or a modified scheme suitable for foremen, architects' and engineers' assistants, and the like. Diplomas are given to those who have attained a certain standard of efficiency.

The practical courses consist of designing, topographical work, testing and laboratory work; and practical work of all kinds such as excavation, masonry, brickwork, joinery, ironwork, and the uses of modern machines and methods connected with the industries under consideration. The preparatory course may be omitted if pupils have already acquired a sufficient knowledge of elementary science and mathematics to enable them to follow the special courses. In the latter the idea is to give a theoretical and practical training which will fit students to fulfil positions such as managers and engineers of works, contractors, managers of railway companies, electrical and architectural engineers, foremen, clerks of works, etc.

Three methods of teaching are pursued to suit day students, evening students, and corresponding students.

The school is a private venture, has no State or other assistance, and has been in successful operation for sixteen years, during which the number of pupils has steadily increased from 15 in 1892 to 5,994 in 1907. During the long vacation students are afforded opportunities for spending as much time as possible in industrial concerns, where they make themselves useful and see in practical work the application of the theory they have studied at the school. It is evident, therefore that the school meets a real want, and, indeed, it is claimed that the employment for finished students from this school exceeds the supply.

Interior of the designing room.

The main features which seem to make for its success are:—First, the combination in one school of the four related sections referred to, which enables a definite programme of practical work to be laid out for each year, as, for example, in 1906 and 1907, when the installation of a small railroad was undertaken, involving every kind of operation necessary to a complete installation. This was first studied and designed and then executed on the experimental ground by the pupils. Each section had its share in the completed work. This method is superior to that which attempts to deal exclusively with one trade or handicraft, as brickwork, joinery, and the like, and must be much more interesting to the students.

Second, the combination of theory with practical applications, which pervades the whole scheme, and the opportunities afforded to visit works in progress.

Third, the methods of teaching, by correspondence, evening classes and day classes, which enable students at a distance to go to Paris to enjoy the advantages of a full course: thus the whole of France becomes a recruiting ground for the school, and accounts for its large number of students.

There would appear to be an opening for a college on similar lines in this country, combining the sections of architecture, building, civil engineering, and electrical engineering, working in sympathy with existing agencies for training in these professions.

Mr. W. Kaye-Parry, M.A., Dublin University, M.Inst.C.E., F.R.S.I., has been appointed External Examiner in Sanitary Engineering in the Faculty of Technology in the Victoria University of Manchester.

* * *

We have received a copy of a pamphlet in which the plans and sections of the A.A.A.C., or Architectural Association Athletic Club, are set forth. Messrs. J. H. Squire, L. M. Gotch, F. A. Silk, and A. L. N. Russell, are the editors, and we judge from the particulars given that the A.A.A.C. is flourishing as the green bay tree.

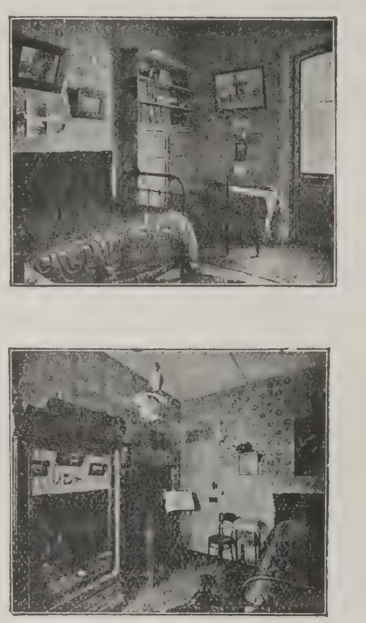
SOME RECENT COMPENSATION DECISIONS.

The Workmen's Compensation Act of 1906 continues to provide a most luxuriant harvest to the legal profession. The extreme vagueness of this piece of legislative venture, and the remarkable elasticity of which its provisions are capable, have been the subject of a good deal of criticism; and these shortcomings are exemplified in a batch of very interesting cases which have engaged the attention of the Courts during the last month or so. Generally the decisions that have been registered in these cases show all too clearly how judiciously has the net been spread to ensure the liability of the employer. But they do, thank goodness, in one or two instances establish the feasibility of a workman meeting with some sort of mishap in some circumstances, and yet cutting himself off from the support of his employer.

A case in this category is that of Warncker v. R. Moreland and Son, Ltd., in which the Court of Appeal has decided that the refusal of a workman to submit to a simple surgical operation disentitled him from compensation in respect of an accident for which the employers had already been held liable. The risk involved in the operation was hardly appreciable; but the County Court judge had held himself bound by an earlier decision of the Court of Appeal (in Rothwell v. Davies), and had reluctantly found in favour of the man. Their Lordships of Appeal, however, have reversed the finding of the lower court, on the ground that in the earlier case it was proved that the operation was fraught with considerable danger, whereas in the present case there was practically no danger attached to the operation. The reasonableness or unreasonableness of the refusal must be the deciding factor in such cases; and the workman's justification for declining to submit to surgical treatment depends upon the nature of that treatment and the man's physical condition.

Of direct importance to the building trade is an interesting decision that has been given by his Honour Judge Hans Hamilton in the Kirkham County Court. A bricklayer had met with an accident in the course of his employment, in respect of which he received compensation from his employer. Subsequently the employer executed a deed of assignment, and further payments were received from the Federated Employers' Insurance Association, Ltd. The payments, however, eventually ceased altogether, the insurance company denying further liability under a clause in the policy determining their liability in the event of the employer becoming bankrupt. The man asked for an order against the insurers for the continuance of the payments, and his Honour granted the application.

Another remarkable decision given by the Court of Appeal is that delivered in Colclough v. the Orrell Colliery Co., establishing the dictum that a posthumous illegitimate child is a "dependent" within the meaning of the Act. A young collier was engaged to be married. The banns were published, but two days before the date fixed for the marriage the man was accidentally killed at his work. A child was born to his intended wife three months after the man's death, and the County Court judge, holding that it was a dependent upon the earnings of the deceased, awarded it £155. The employers appealed, but their appeal has been dismissed. The Compensation Act has a peculiarity not possessed by any other Act of Parliament, in that for many purposes it puts an illegitimate child in the same position as a child born in wedlock. It has already been decided that a posthumous legitimate child is a "dependent," and the Master of the Rolls based his interpretation of the Act in this case upon that decision. It is important, however, to note that in this case the deceased had fully admitted the paternity of the child. In other circumstances it would be very difficult to bring it within the scope of the Act.



A Pupil's bedroom.
TRAINING SCHOOL AT ARCUEIL-CACHAN.

A decision has been given by his Honour Judge Rentoul in the City of London Court, which, failing its modification by the Court of Appeal to which it is to be taken, must have a marked effect upon the practice of employers of assisting injured workmen pending legal proceedings. A labourer met with an accident, in respect of which his employers for six weeks paid him compensation at the rate of £1 a week. It was then discovered that the man's wages averaged only £1 11s. 2d. per week, and that he was therefore only entitled to compensation at the rate of 15s. 7d. The employers naturally enough declined to make any further payments until the overpaid balance had been worked off. The man took them to court, contending that they were estopped in law with regard to the overpaid monies. Judge Rentoul found in favour of the man, declaring that the overpaid amounts were really a present to the workman, and so need not be repaid. The employers gave notice of appeal; and, as their counsel pointed out, if employers are thus not to be allowed credit for their voluntary payments, they will be less inclined than at present to give any assistance at all until the workman has obtained a verdict against them.

The vexed question of the respective liability of principal and sub-contractor is the subject of another recent decision of the Court of Appeal. Wilson and Co., Ltd., a firm of colliery proprietors, contracted with a sea captain to take out two lighters to an oversea coaling station. The officer engaged and paid his own crew, and on the voyage one of these, the boatswain, was injured. He claimed compensation under the 1906 Act from Wilson and Co., and the County Court judge decided in his favour. Wilson and Co. appealed, but the superior court has upheld the judge's decision. The Master of the Rolls expressed the view that Section 4 of the Act is not limited to the case

Interior of the workshop.
TRAINING SCHOOL AT ARCUEIL-CACHAN.

A Corner of the Electric Laboratory.

TRAINING SCHOOL AT ARCUEIL-CACHAN.

of a sub-contract; and that a vessel may be "premises" within sub-section 4 of the same sections. His Lordship, however, refrained from expressing any opinion as to the effect of this very abstruse section where the facts may be different. Its interpretation must be according to the merits of the case; a useful instance of the wonderful ingenuity underlying the construction of this wonderful Act.

The power of the judge to reduce or suspend the weekly payments under an order under the Act, in the event of the plaintiff's imprisonment on indictment, has been asserted by Judge Sir Sherston Baker in the Lincoln County Court. An injured workman had obtained an order for 13s. a week compensation, and this his Honour has reduced by 1d. per week during the man's term of 9 months' imprisonment. There were four children dependent upon the "earnings" of the workman, and his Honour expressed the wish that the 12s. 11d. should be paid meanwhile to them, a suggestion which the applicants, Clayton and Shuttleworth, Ltd., said should have their attention.

We have outlined a few of the more striking of recent decisions under the Act. They serve to point the indeterminable scope which it gives in the workman's favour, and should impress the employer of labour with the extent of the liability to which it exposes him—liability, however, against which he can readily indemnify himself. We need hardly point out that with an Act at present so fruitful of indeterminate legal points, for a building trades employer to neglect to protect himself is to court disaster.

BIRMINGHAM CLERKS OF WORKS AND BUILDERS' FOREMEN'S ASSOCIATION

The last two monthly lectures delivered to the members of the above Association have been particularly interesting. In December Mr. W. H. Bidlake, M.A., gave an address on "Doorways," which he treated as the main features of every building, and traced their forms from the earliest times—when they consisted simply of two strong wood or stone uprights with a lintol over—through the Assyrian, Egyptian, Greek, and Roman periods, up to the Gothic and highly-decorated cathedral doorways of the Middle Ages.

The lecture, which was illustrated by lantern slides from photographs mostly taken by the lecturer, attracted a large audience, who accorded the lecturer at completion a very hearty vote of thanks.

In January, Mr. F. G. Whittall, the president of the Master Builders' Association, addressed the members, the subject of his lecture being "The Romance of a Building Stone." Mr. Whittall explained how the earth was at one time a molten mass surrounded by heavy clouds of steam, and how at that time the particular attraction of certain bodies for each other caused the formation of certain substances, as, for example, the combination of quartz, felspar, and mica, resulting in the formation of the granitic rocks; and how in later ages the sand resulting from the disintegration and crushing of the quartz, became compressed and hardened by the weight of superincumbent matter, through which water slowly percolated and became charged with lime and other cementatious substances, which were deposited among the grains of sand, thus forming our sandstone beds, whilst on the bed of the ocean limestones were being formed by the dead bodies of oolites, corals, and other marine organisms. These lime-

The Residence.

TRAINING SCHOOL AT ARCUEIL-CACHAN.

stone deposits were in later centuries upheaved by volcanic action, and through the depression of the ocean bed, and "the gathering together of the waters," they became land and the stone was ready for the use of man. The lecturer treated the difficult and vast subject of geology and the earth's formation and metamorphosis in a simple and interesting manner, which could be understood by everyone, especially as he produced samples of the various rocks when referring to their characteristics. The large audience followed his remarks with great attention, and at the conclusion many expressed their great delight and wonderment that their was so much to be learned about a simple stone. A hearty vote of thanks was given to the lecturer.

Proposed New Works.

ABERDEEN.—The Plans Committee of the Aberdeen Town Council have considered plans for the erection of one dwelling-house for two tenants, three dwelling-houses each for six tenants, and new aerated water factory in Seaforth Road for Messrs. Sang and Company. The Plans Committee have approved the plans of the following buildings:—Dwelling-house, on the west side of King Street (Woodside), for Mr. William Watt, carpenter; office and showroom on the west side of Holland Street, for Mr. William Masson, plasterer, per Mr. William Beattie, architect; two dwelling-houses on the south side of Willowbank Road, for Messrs. W. Henderson and Son, architects; hall, on the west side of Greyfriars Place, for the rector and vestry of St. Margaret's Church, per Mr. George G. Irvine, architect.

BAKEWELL.—The architects (Messrs. Bryden and Walton, of Buxton), have been instructed to proceed with the specifications and quantities for proposed new baths and pump-rooms, and application is being made to the Local Government Board for a loan of £3,500 for the work.

BLACKBURN.—The Town Council have approved of application being made to the Local Government Board to borrow £24,150 for the erection of a new higher elementary school, and £4,435 for the construction of a swimming bath in connection with the school. These buildings will be erected on a part of a site which cost the corporation more than £80,000.

CRUMPSALL.—The erection of a new library for the Crumpsall and Cheetham Hill district has been sanctioned by the Manchester City Council.

DUNFERMLINE.—At a Dean of Guild Court held at Dunfermline, Messrs. H. and J. Philip, joiners, Campbell Street, applied for and obtained warrant to erect a dwelling-house and stable at Castleblair Park; and Robert Macgregor, pasterer, Grantsbank Street, received permission to erect three tenement blocks of dwelling-houses at the corner of Victoria Terrace. It was stated that each block would contain six houses.

ECCLES.—The Town Council have agreed to borrow £2,739 to build twelve working-class dwellings in Corporation Road.

HALIFAX.—A scheme of church extension for the parish of St. Paul's Kingcross, is estimated to cost about £15,000, but the prospect of building is not immediate.

HOLBORN.—The Primitive Methodist Connexion, who have acquired Holborn Town Hall, expect to have to spend £10,000 on its conversion to suit their requirements.

INVERNESS.—The Town Council are considering the advisability of rebuilding the Burgh police buildings, at a cost of about £4,000, instead of altering the present buildings at a cost of £1,700.

LEWISHAM.—The following building and drainage applications have been approved by the Borough Council:—H. Brickell, Rojack Road, to build and drain an addition to No. 34, Stanstead Road; W. J. Scudamore and Sons, Manor Park, to build two houses on the north side, Nos. 97 and 99; B. Hosegood and Sons, Myrtle Grove, to build and drain two houses on the north side; W. Benton, Ewhurst Road and Crofton Park Road, to build and drain five houses and shops at the junction of Ewhurst and Crofton Park Roads; J. Watt, Eliot Hill, to build and drain six houses on south side (Nos. 7-12); J. Johnson, Brownhill Road, to build and drain two houses on the south side; J. W. Heath and Sons, Phœbeth Street, to build and drain seven houses on the west side (Nos. 22-32); James Watt, Eliot Park, to build and drain six houses on the north side; J. Laird, Farley Road, to build and drain two houses on the north-west side.

LLANDRINDOD WELLS.—The U.D.C. have resolved to apply to the Local Government Board for a loan of £10,000 for the erection of a pavilion in the recreation ground on the lines of plans submitted by Messrs. R. Wellings Thomas, F.R.I.B.A., and W. A. Millward. The original intention was to spend £6,000 on the proposed pavilion, but the Council are now satisfied that the needs of the place can only be met by a larger expenditure.

MATLOCK.—A Local Government Board inquiry has been held at Matlock Bath, dealing with the erection of a Kursaal and the conclusion of an improvement scheme which has been in hand for some years.—It was stated that under a special Act of Parliament the District Council was empowered to spend about £20,000 in promenades, pavilions, a pump room, etc., and in the acquisition of the property then standing on the sites. By private treaty and arbitration the Council has now acquired the most important sites in the town, and on the old Fishpond stables site is about to build a kursaal or pavilion, with a large ballroom, offices for the surveyor, town clerk, and the Council, and a pump room. The Council had left out of their Act, after buying the properties, about £3,000, and they now asked the Local Government Board to sanction the borrowing of a further £8,500 to complete the scheme. Mr. F. O. Stanford, A.M.I.C.E., was the inspector.

NEWBURGH.—The Town Council are applying for a grant of £5,000 from the Charles Anderson trust to provide a cottage hospital for the town and district.

PENDLEBURY.—The Swinton and Pendlebury Education Authority are about to erect a new public elementary school in Warwick Street, Cromwell Road, Pendlebury, and for this purpose have accepted the designs of Mr. T. J. Bushall, architect and surveyor, of John Dalton Street, Manchester. The new school, which is to be a single storey building will afford accommodation for 500 boys, 500 girls, and 250 infants, and the probable cost, based upon an allowance of £10 for each scholar, will be £12,500. The original intention of the Education Committee was to provide for only 1,000 children, but it was eventually decided to bring the number up to 1,250, and build a school which will in all probability meet the requirements of the immediate neighbourhood for the next 20 years.

WESTMINSTER.—An effort is to be made to complete a chapel to St. Joseph in Westminster Cathedral, at an approximate cost of £6,000. The altar and marble work alone are expected to cost £2,300.

BUILDING IN MOMBASA.

By A. G. H. Thatcher.

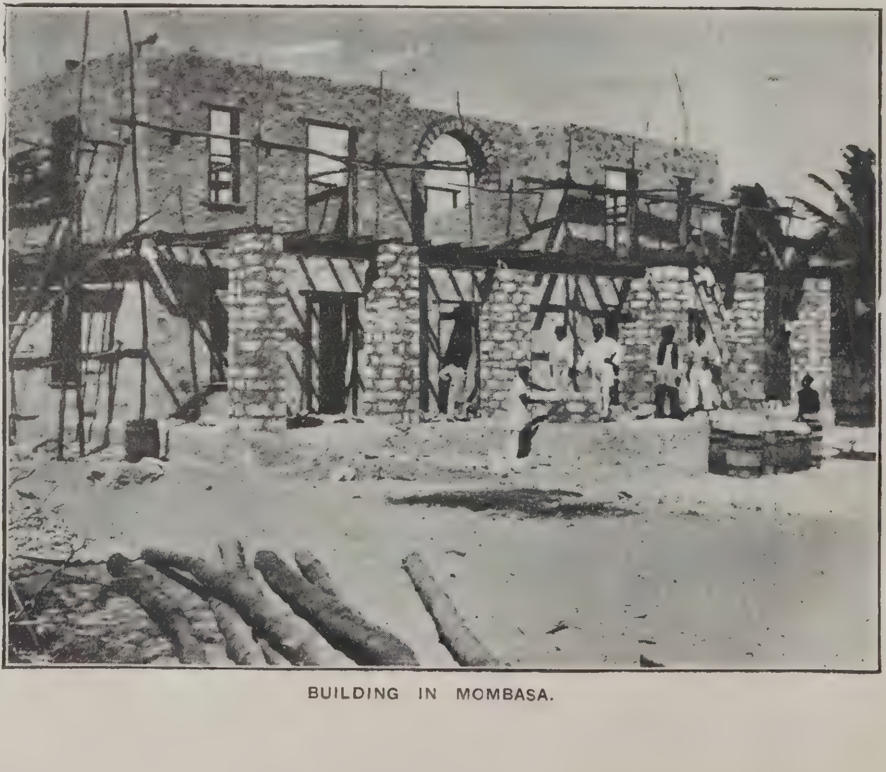
It cannot be expected that the means and methods of building on the East coast of Africa would be particularly up-to-date, and the photograph attached, which was recently taken in Mombasa, well illustrates that point of view. The building shown is to be a storehouse of two floors in height. The material for the walls is of a stone found locally and known as "coral." It is "cemented" together with a red earth, also found in the neighbourhood, but with better class work some lime is added to it.

The scaffolding employed is of the roughest quality, as will be seen from the print. The ladders are primitive, having an air of being "home made."

Brickmaking is quite a new industry in this part of the globe, at least on a systematic scale, but its recent commencement on a more extended basis probably points to a considerable increase in its use for buildings in the future.

This must not be taken to mean that there will be any opening for British labour in the connected trades. These are monopolised by the "fundi," or mechanics, who each work at their own trade. Hindoos and Swahili are chiefly employed, and their rate of pay—for the Hindoo an equivalent of about fifteen shillings per week, with no rations, and for the Swahili twelve shillings, with rations of rice—practically eliminates all possibilities of competition from white labour at present.

Europeans are not accustomed to live at the standard represented by the purchasing value of a few pence per day; and until such times arrive when European skill is required in the various operations necessary in this trade, the conditions are not likely to alter.



BUILDING IN MOMBASA.

THE NATIONAL FEDERATION OF BUILDING TRADES' EMPLOYERS OF GREAT BRITAIN & IRELAND.

Half-yearly General Meeting.

The half-yearly general meeting of the National Federation of Building Trades' Employers of Great Britain and Ireland was held in the Balmoral Room, Trocadero Restaurant, Piccadilly Circus, London, on Wednesday, January 27th, Mr. C. H. Barnsley (Birmingham), President of the Federation, presiding. There were also present:—Messrs. H. Marshall, Southampton; R. Hall, Bury; J. A. Tweddle, Tees-side; J. Proud, W. Hartlepool; R. J. Huntley, Sunderland; H. Willcock, Wolverhampton; A. Krauss, Bristol; G. Humphries, Bristol; J. B. Johnson, Liverpool; F. Griffiths, Liverpool; W. F. Drew, Stroud; M. Coltherup, Portsmouth; G. R. Chamberlain, Portsmouth; F. W. Amphlet, Birmingham; S. Ambrose, Bath; W. G. England, Barnsley; J. Davidson, Leeds; S. Easten, Newcastle-on-Tyne; W. Foster, Newcastle-on-Tyne; J. H. Walker, Derby; A. Wright, Derby; B. Talbot, Bolton; F. Woods, Bolton; J. Hamilton, Altrincham; W. Irwin, Leeds; J. Denver, Manchester; N. R. Stirling, Liverpool; E. J. Brown, London; J. Carmichael, London; E. J. Hill (substitute for F. Higgs), London; P. Rhodes, Leeds; D. Williams, Pontypridd; R. W. Moon, Newport, Mon.; T. Hartley, Blackpool; W. R. Thompson, Dewsbury; W. Jewell, Newport, Mon.; W. Cooke, jun., Preston; H. Matthews, Manchester; W. M. Blackburn, Newport, Mon.; G. Macfarlane, Manchester; E. Archer, Northampton; W. Tinker, Manchester; W. Hall, Liverpool; A. S. Smith, Birmingham; F. G. Whittall, Birmingham; H. Erwood, Bath; J. Wright, Nottingham; A. Chambers, Leicester; E. J. Neale, Bristol; W. Wistance, Walsall; S. A. Dove, Leicester; W. Yates, Leicester; W. H. Hope, Sunderland; T. Costigan, London; G. W. Wilson, Leeds; H. Smith, W. Bromwich; H. Lever, Liverpool; — Stokes, Worcester; J. B. Whitehouse, Birmingham; A. W. Chamberlain, Burton-on-Trent; J. T. Armstrong, S. Shields; W. Johnson, Wigan; J. Charles, Newport, Mon.; J. Beggin, Sheffield, W. T. Ledgard, Leeds; C. Dent, York; J. Hardgrave, York; G. F. Leadbeter, Newport, Mon.; A. Mastin, Sheffield; W. Shepherd, London; R. Chambers, Walsall; W. Thomas, Cardiff; J. S. Brown, Liverpool; J. Storrs, Stalybridge; W. Bullen, Liverpool; S. B. Depree, London; T. Wilkinson, Middlesbrough; and the Secretary (Mr. A. G. White).

Notice of Meeting and Non-attendance.

The notice convening the meeting having been taken as read,

The SECRETARY (Mr. A. G. White) announced apologies for absence from Messrs. J. E. Tinline (Bury), W. Marshall (Manchester), J. Marshall (Manchester), W. H. Jessup (Huddersfield), E. Turner (Cardiff), E. W. Wooster (Moseley), E. Wm. Nicholson (Leeds), F. Higgs) (London), H. Moore (King's Norton), and R. J. Hill (Great Yarmouth).

Minutes.

On the motion of Mr. Matthews (Manchester) seconded by Mr. Cooke (Preston), the minutes of the last meeting (printed copies having been previously supplied to the members), were taken as read, and were adopted on the proposition of Mr. A. S. Smith (Birmingham), seconded by Mr. Cooke.

Executive Council's Report, Statement of Accounts, etc.

The CHAIRMAN moved the adoption of the Executive Council's thirty-first annual report for the year ended December 31st, 1908, of which a summary appears as the first item in the Federation monthly reports.

The CHAIRMAN having called attention to several of the items in the report which had been under discussion by the Council at their meeting on the previous day, and explained what had been done in regard to them, moved the adoption of the report.

Mr. G. MACFARLANE (Manchester) seconded the motion.

Mr. W. R. THOMPSON (Dewsbury) called the attention of the meeting to paragraph 23 of the report, referring to the case of a member at York, and said this was distinctly a case to which the National Federation ought to give its support. The sub-contractor was a member of the Yorkshire Federation, but beyond that there was a question of principle involved. That which had occurred in respect of this material might occur in respect of other materials used in the building trade, and other contractors might find themselves placed in the same difficulty as this particular sub-contractor. The course that he would suggest the National Federation should take would be to step in and give its support to the Yorkshire Association, who were moving in the matter. He moved that the National Federation give power to the Administrative Committee to deal with the case as they thought fit after proper consideration. All the facts would be placed before the committee, and the matter could be thoroughly gone into.

Mr. MACFARLANE seconded the motion, and stated that the Yorkshire Federation had promised to furnish the Administrative Committee with all the details and documents.

The motion was carried, and the report of the Executive Council adopted.

The TREASURER (Mr. J. W. White) then moved the adoption of the statement of accounts, and said that the expenses were slightly in excess of the receipts. The contributions from members amounted to about £790, of which £400 came from the Northern Centre, and the balance from other Federations. This showed a diminution of about £60 or £70. The reserve fund showed an increase. There was also a considerable amount outstanding, and he hoped that the members present would see that the various federations kept up their contributions in fairness to those federations which had paid. There was a sum in hand on reserve account amounting to about £700, and he moved that the Administrative Committee be instructed to invest £500 of it.

Mr. JAS. WRIGHT (Nottingham, hon. auditor) seconded. The professional auditor, Mr. Robertson, of the firm of Messrs. Minton, Robertson and Co., chartered accountants, he said, had assured him that the accounts had been duly checked, and were all in order. One matter which arose during the Council meeting the previous day was as to the advisability of members being informed as to the current value of their investments, and it had been arranged that next year this information should be given. Mr. White had said that the expenditure slightly exceeded the income, but he (Mr. Wright) would like to point out that in the past year's accounts there were several items, amounting to £50 and £60, which were extraordinary expenditure. He fully sympathised with the remark that gentlemen in the various federations should see that contributions were duly paid. The Federation ought to have sufficient income to meet its expenditure.

Mr. S. SMETHURST (Oldham) asked whether any statement was forthcoming concerning the Birmingham case (Smithies v. N.A.O.P., see BUILDERS' JOURNAL, January 6th, p. 7).

The CHAIRMAN asked Mr. Albert Smith to reply to the question. Mr. A. S. SMITH repeated the information given in the report, and said that in the event of the N.A.O.P. deciding to carry the matter to the House of Lords, it was stated that they might do so if they deposited £50 as damages by a certain date. That date had expired the previous day, but he could not say whether the money had been deposited.

The motion that £500 of the funds in hand should be put out for investment was carried, and the statement of accounts adopted.

The Recommendations of the Administrative Committee.

The next business was the consideration of the recommendations of the Administrative Committee, which had been endorsed by the Executive Council.

The CHAIRMAN moved the first, namely, "That the resolution of the general meeting limiting the sale of the agreed form of contract to members of the Federation, as passed on July 22nd, 1903, be rescinded."

Mr. SMETHURST seconded, and it was carried.

The next recommendation had reference to the N.A.O.P. agreement. The CHAIRMAN again moved: "That the joint committee as required by Rule 5 be constituted, and that the employers' side of the said committee consist of ten members apportioned as follows:—Three to be elected by the N.A.O.P., four to be representative plasterers elected by the centres, three to be representative general contractors elected by the National Federation."

It having been seconded by Mr. Mathews,

Mr. W. COOKE (Preston) asked whether that was the only outcome of the resolution which had been passed at Birmingham. According to that resolution, a committee was appointed to consider the mending or ending of the agreement with the Association of Operative Plasterers, and report to the annual meeting. Now, he supposed, the only thing they were going to carry out was one clause of the agreement. Why that clause was not carried out at the time the arrangement was come to he could not understand.

The SECRETARY read the recommendation of the special sub-committee appointed by the Administrative Committee, which was to the effect that the complaints which had arisen would probably be satisfactorily dealt with if a joint committee, as required by Rule 5, was constituted.

Mr. J. B. JOHNSON (Liverpool) said that the matter gave rise to considerable discussion at the sub-committee's meeting, and various proposals were put forward. The general impression, however, was summed up by the chairman (Mr. S. Smethurst), who said that the grievances complained of resulted largely from the fact that the joint committees had not been kept in active operation; the remedy was to carry out the rules properly, and he recommended that the joint committee as required by Rule 5 should be agreed to. This was carried, and it was further recommended that the employers' side of the committee should consist of ten members, three of which were to be members of the N.A.M.P., four to be plasterers' representing the centres, and three to be general contractors. That was confirmed by the Administrative Committee, and by the Council on the previous day.

Mr. SMETHURST said the proposals of the Birmingham resolution and those originated by Mr. Johnson had been fully discussed, but it was not considered necessary to take action on any of the individual points raised by Mr. Johnson. There was a difficulty in doing so, because the agreement provided for a joint committee of employers and operatives to deal with grievances which might arise in connection with the plasterers' trade, and this committee had not been formed, and grievances had remained undealt with in consequence. It seemed obvious that before taking any other steps they should get the joint committee constituted to hear any grievances which might be forthcoming; hence the recommendation. Then, if any complaint were made of a breach of the agreement, the case would be reported and investigated, and a decision arrived at upon the facts as presented by both sides This was the unanimous finding of the committee.

Mr. DAVIDSON (Leeds), asked whether the committee had considered the desirability of the operative plasterers becoming parties to the National Conciliation Scheme, and thus bringing them into line.

Mr. SMETHURST said that the operative plasterers had been approached on this matter on several occasions, but they had always declined, being of the opinion that their agreement arrived at in London was preferable to the Conciliation Scheme. It had been suggested that the employers might abrogate the London arrangements, but many of them did not desire that, and so they had taken the only other proper course, viz., to recommend the use of the proper machinery for dealing with the situation. If, however, that were not successful, then they might have to adopt the proposal to abrogate.

Mr. HOPE (Sunderland) asked when was the last occasion the plasterers were invited to come into the scheme. He knew that, in the North of England, there was a disposition to come into line, and he would like to know whether there had been any lately to bring them into the scheme.

The SECRETARY: They were invited last year, but for a second time they replied that they could not depart from their original attitude. I have seen their secretary, but they prefer the old agreement.

Mr. COOKE said that of course he would accept Mr. Smethurst's explanation, but he could not help expressing surprise that an agreement which had been in operation for some time had not had one of its vital principles carried out. Along with the National Committee, local committees had to be formed to consider cases in their districts, and then if they did not agree they had to be sent to the National Board. They were formed in many towns, yet the higher tribunal to which they had to appeal was not existing.

The recommendation was then put to the meeting, and carried.

The CHAIRMAN proposed, *re* the individual members of the National Federation, "That every individual member who pays £2 2s. per year subscription should become entitled to one year's free supply of the official journal, the account for this to be sent to and paid by the Federation."

Mr. SMETHURST seconded. He did not think, he said, that the object of this recommendation was very clear to the Council, but it was the opinion of their secretary that it would prove a means of propagating the membership of the Federation. In certain parts of England, which were very rural in their nature, it was exceedingly difficult to get anything like organisation. The southern counties had only a few towns containing members of the Federation, and were scarcely in a position to run an effective organisation. The secretary thought, therefore, that this recommendation might obtain an increase of individual members who would subsequently form the nucleus of federated associations. He (Mr. Smethurst) thought the scheme was a good and wise one, and he had great pleasure in seconding the proposal. It would admit members, where there was no association in their district, as individual members at a subscription of two guineas, carrying with it a copy of the official journal, which helped considerably the objects of the Federation.

Mr. GREENWOOD (London): Are there no individual members at present?

Mr. SMETHURST replied that there was only one in the Federation.

Mr. GREENWOOD asked if there were any rules which applied to such members, and what was the subscription.

The SECRETARY replied that there was a rule which applied to such members, and that the subscription was two guineas.

Mr. GREENWOOD: The proposal is, then, that there is no alteration in the provision as to the introduction or the subscription of individual members. All that is proposed is to give them a copy of the "Journal" without any increased subscription.

Mr. HOPE said that there were also individual members of various federations throughout the country in districts where there was no association. In such cases these individual members were in the same position in regard to local federations as those particular members were in regard to the National Federation.

Mr. DAVIDSON asked whether it was possible for any individual member to become associated directly with the National Federation if that member was in the area of a county federation.

The CHAIRMAN: No. They join through the latter.

The recommendation was carried.

Mr. STORRS (Stalybridge) next moved the following recommendation in regard to the application of builders' labourers for admission to the Conciliation Scheme:—"That this committee recommend that the application of the builders' labourers for admission as parties to the National Scheme of Conciliation be not acceded to, but that builders' labourers be allowed to join local conciliation boards where the employers and skilled operatives are in favour of such a course, provided that the agreement under which they are so admitted shall clearly state that their admission is purely optional and not of right, and shall further provide that no labourer representatives shall sit on the Centre or National Boards to adjudicate on cases from towns where the labourers' union or unions do not receive recognition, and shall only sit on local boards when matters affecting their interests are concerned. That where a labourers' union is admitted into the local conciliation board of any district, and a dispute arises which the local board cannot settle, a joint application by the parties concerned for their case to be heard by the Centre and National Boards shall be granted, provided both applicants agree to accept the decision of either of these Boards, and to pay all expenses of the hearing or hearings. That the above resolutions be duly communicated to the National Board." Mr. Storrs explained that application was made by some of the societies of labourers for admission to the conciliation scheme. When that matter was under discussion, it was found that great differences of opinion existed with regard to it in various parts of the country. Some districts, particularly in the Midlands, had recognised rules relating to builders' labourers, and would naturally like to join in the benefits of the conciliation scheme. There were other districts where labourers were not recognised by any of the master builders' associations, and especially was this the case in Lancashire and Cheshire. He thought it was very desirable, in all places where builders' labourers were recognised and had copies of rules signed between themselves and their employers, that they should be allowed to participate in the benefits of the conciliation scheme; but owing to the wide difference of views held in the various parts of the country, it was impossible to agree to their admission to the full benefits of the scheme. The Administrative Committee, therefore, had decided to recommend the resolution he had just submitted to the meeting.

Mr. DAVIDSON seconded. He did so, he said, in order to ask whether, before going before the National Board in case of a dispute, some representation could not be made to carry out the spirit of the rules. In Yorkshire many operatives' societies were prevailed upon to bring cases in dispute before local authorities. That was a direct breach of the letter and spirit of the rules. The conciliation rules stated that all matters in dispute should be brought before a conciliation board. One of the very societies desirous of benefiting in this matter took what they considered a breach of the fair wages' clause before the local corporation, and a committee of that authority considered the matter for some time, and heard evidence. They finally, however, passed a resolution that no such breach had been committed. In spite of this decision, the next thing the society did was to ask that the local conciliation board should be called upon to deal with the same matter. They were told, however, that all such matters of dispute should have been referred to the conciliation board in the first instance. They had chosen to take it first before the corporation, and the conciliation board would not now entertain it. It was a matter of principle, and he strongly urged that all associations brought into line with the National Conciliation Scheme should be given definitely to understand that there was no right to appeal to any court until the Conciliation Board had first heard and determined upon the matter in dispute.

Mr. STOKES (Worcester) said that ever since the conciliation board was formed for his district, they had had representatives of the Labourers' Society upon it. These representatives had always attended the meetings of the board, and had always been good men to deal with. He did not know whether their admission to the board was a breach of the rules, but the arrangement had worked very satisfactorily.

The recommendation was agreed to.

The last recommendation of the Administrative Committee was the consideration of amendments proposed by the Northern Centre to the Conciliation Board rules.

Mr. MACFARLANE, dealing with the first proposal, said the suggestion was to add to Rule 2, after the words, "If, however, the principal place of business of the contractor is not situate within the district covered by the local conciliation board," the words, "or should a dispute arise on a job of an employer outside his own town or district," and then continue, "it shall be competent for him to demand that the case shall be heard by the Centre Conciliation Board of the district where the work is performed, in lieu of the local conciliation board," etc., to end of rule. This alteration, continued Mr. Macfarlane, was passed at the Council meeting on the previous day, and the effect of it would be to widen the scope of the rule without in any way altering it. He moved that the alteration be adopted.

Mr. BLACKBURN (Newport) seconded, and it was carried.

Mr. MACFARLANE proposed the next alteration, viz., in Rule 13 (regardng the decision of voting), the insertion of the words, "But should there be cross-voting the decision shall be given in favour of the side securing at least two of such cross votes," etc., etc. At the present time, said Mr. Macfarlane, one cross-vote carries a decision. It was considered by those who proposed the insertion of the words that if the arguments from one side convinced only one man, and so altered the decision of the Board, it could hardly be called a conciliation board. For his own part, he believed that if one-half of one side failed to agree with the decision of all the members on the other side, it was not a proper conciliation. They had cases where it was considered that there was a miscarriage of justice by reason of the fact that mistakes had been made owing to one individual voting along with the operatives, and carrying the decision with him without thoroughly realising the true position of the matter. This sort of thing had received not only the disapproval of the masters, but also of the operatives. Cases which had been decided by what might be called this "scratch voting" had been immediately brought up again for further consideration. They had two such cases in Lancashire which were likely to cause a great deal of friction. There could be no lasting conciliation if, immediately after a "scratch vote" of this kind, the losing side were filled with a burning sense of injustice. They thought, therefore, that the rule should be altered. If the arguments coming from one side were not sufficient to influence more than one on the other side, then they could not be very weighty, and it was not fair that such arguments should be sufficient to impose hardship on a side which considered itself unjustly dealt with.

Mr. THOMAS (Cardiff) seconded, and said he was guided in his opinion by the decision of a conciliation board appointed to deal with a dispute between masters and men in

Mr Macfarlane pleads for two cross votes

SKETCHES AT THE NATIONAL FEDERATION MEETING: BY OUR SPECIAL ARTIST.

the Welsh coalfields, and in that case if two or three cross-votes had been necessary, the decision would have been very different from what is actually was.

Mr. SHEPHERD (London) said there had been circulated in the room that morning a report of the proceedings on the previous day, and he thought it was only fair that he should state his views with regard to the matter. His view was that if two parties sat down to hear and consider the merits of any dispute between them, when they voted upon it a bare majority should decide the question, otherwise conciliation became a mere farce. In the case instanced it appeared that the decision had been given against the employer; but with their conciliation board in London they had had numerous cases where decisions had been given against the employer.

Mr. MACFARLANE: By one vote?

Mr. SHEPHERD: By a majority.

Mr. MACFARLANE: That is another thing.

Mr. SHEPHERD said they did not count the votes; he could not say whether it was one or two or three, but it certainly could not be many. (A voice: We don't want "many.") Was it to be assumed by impartial and unprejudiced persons that in the case of every dispute which arose the operatives were absolutely in the wrong? He contended that when the questions in dispute were debatable points, where evidence had been adduced by both sides, the matter had been thoroughly thrashed out, and a vote taken, the majority on that vote, whether it was one, two, three, five, or six, should decide the question. He failed to see what advantage would be gained by making the majority two. If the one side were dissatisfied with the decision arrived at, it was not likely that it would be more content because that decision was arrived at by a majority of one instead of two.

Mr. MACFARLANE: There is less chance of a mistake.

Mr. SHEPHERD: I don't think so.

Mr. MACFARLANE: But we know it.

Mr. SMETHURST said they were always very grateful for the opinions Mr. Shepherd might give them, because that gentleman brought the most mature judgment to bear on all questions he discussed; but it was only fair to mention that the London Association was not a party to the conciliation boards, and consequently had no knowledge of their working. What might appertain to London might not in the same degree appertain to the conciliation board elsewhere. Some alteration in the present system was necessary, and he believed the operatives felt the grievance as keenly as they did. The danger of the existing system of voting was of giving a decision contrary to all the facts, which tended to create a considerable grievance in the town where the judgment had been given against them. He had such a case in mind; and while the town in question loyally accepted the verdict, they had given notice to have it reversed through an alteration of rules at the earliest opportunity. Mr. Shepherd argued that these conciliation boards were in the nature of individuals coming with open minds to discuss the matters under consideration. That, however, was not the case at all. The parties came with the full intention of securing their own ends, or as much as they could. In his experience, the other side always came with a solid front, determined to grasp every point which might arise in their favour during the discussion. They, the masters, however, were not so well organised, nor had they got that solidarity which signalised the operatives. They were unable to argue their cases so efficiently or with such precision. It therefore sometimes happened that one member of the board, not understanding the merits of the case, gave his vote out of the kindness of his heart to the other side, and so turned the decision against himself and his colleagues. Again, there were men in the Federation who declared that they would vote on these boards just as they liked. They would simply go in and give their opinion, and so upset their colleagues on the issue. On the other hand, a great many decisions of conciliation boards had been arrived at by one side giving way to the other when the facts before the board were obviously in favour of their doing so, and many compromises had been reached by the sense of fairness felt on one side or the other. If, however, a case occurred in which neither side felt disposed to yield, because, perhaps, a principle was involved, then, having exhausted the resources of the conciliation boards, the parties could fight. These boards did not pretend to do away with the right of fighting out the issue. That was a condition of things which neither masters nor men desired to see changed; but what the Federation wanted to make sure of was that, before a dispute reached such a pass, all possible chances of a conciliation by compromise and by weighing thoroughly all the facts, were exhausted. The best way of making quite sure of this was to increase the number of cross-votes. Such a proposal did not destroy conciliation, but rather it strengthened it, and he was sure it would be readily accepted by the men who were most seriously concerned with conciliation cases.

Mr. HOPE said they had had the mature judgment of Mr. Smethurst on the one hand, and the equally mature judgment of Mr. Shepherd on the other. It was a question of expediency, and there was no balance of advantage one way or the other. If they were to look, however, at the working of the conciliation boards throughout the country, they would find that many satisfactory decisions had been given, and very few unsatisfactory ones.

Mr. MACFARLANE: By a majority of one?

Mr. HOPE: Don't anticipate me.

Mr. MACFARLANE: I can ask a question.

His point was, continued Mr. HOPE, that if they were prepared to come and tell him that most of the decisions which had been arrived at by a majority of one, and were disadvantageous, then he was prepared to be guided somewhat by their arguments; but that was not the case. The bulk of decisions given by the conciliation boards were secured by a majority of one, but were also advantageous, satisfactory, and likely to be permanent in their results. The only reasons which had been given in favour of the proposed alteration were of the same character as that put forward by Mr. Macfarlane, who had said that mistakes had been made in the past. Surely, however, they could not be asked to seek alterations in the rules because they themselves had been guilty of mistakes. They had been told that the operatives put their cases before the boards with more efficiency, and that on their own side men came who were not competent to exercise their judgment. Well, the remedy for that was to be more careful in their selection of men to represent them on the conciliation boards. When cases occurred of a decision going against them owing to the action of one man, it should serve to bring them to their senses, and induce them to send men competent to form a sound judgment, and give a proper decision.

Mr. STORRS said there were two parties to the scheme, and whatever might be the opinion of the majority in that room, it did not follow that that opinion would meet with acceptance by the other side. He had been associated with the conciliation scheme since its inception, and he was not in favour of the whole scheme being jeopardised by the alteration of the system of voting. If the other side could be persuaded to accept a majority of two cross-votes, he would not be opposed to it, but he wholly failed to see, in view of the decisions in the past, why members should be so much concerned in the matter. In the majority of cases before the conciliation boards they had come out on top. There had been cases where one of their own side had voted the other way and upset the decision, but was that the fault of the system? They must not expect that they were always going to get conciliation from the other side without ever advancing any from their own. If the matter went as far as a conference with the operatives, and he found that the whole scheme was likely to be jeopardised by forcing on the proposal of two cross-votes, he should certainly vote in favour of a bare majority.

Mr. THOMPSON referred to the later amendment, by which the parties would be allowed to retire and discuss the merits of a case before a board after having heard the facts. He believed that such a private consultation before coming to a conclusion would obviate the necessity of the proposed alteration in the voting.

Mr. SINCLAIR (Scarborough) said that Mr. Shepherd had said that the majority must rule, and he thought every member in that room would be prepared to agree with Mr. Shepherd on that matter. The gentlemen, however, who were proposing the alteration were men intimately connected with the conciliation boards, and their action was prompted by their experience. They found that there were defects in the working of the scheme, and they came to that meeting with a remedy. By making the majority of cross-votes larger, every member of a board would secure a scope for his individual judgment which at present he did not possess. Both operatives and employers very naturally wished to do fairly and justly on these boards, but when they would like to exercise their free and unbiassed judgment on one side or the other, they hesitated to do so, because one cross-vote would turn the whole decision. They found by experience that the system placed a restricting influence upon the judgment of members of conciliation boards. They had had more than one mistake owing to this system—mistakes which were not intentionally made. There was no appeal from the decision of a conciliation board, and they had had decisions arrived at in this way which had had most far-reaching effects upon the whole district. They pressed for the alteration, because their experience has shown them that it would be in the best interests of both employers and operatives.

Mr. WILKINSON (Middlesbrough) said that they had generally arrived at a unanimous vote in his district after a conference between the two sides. The decisions which had given rise to the question which the meeting was called upon that day to decide were decisions which need never have been arrived at at all. In one instance, where a rise of ½d. in wages was given, the operatives would have been delighted to vote along with the masters for a rise of ¼d. The men in that case were rather seeking re-arrangement of the time in the district than a rise of wages. They, therefore, came to get a question settled which was not really before the board.

Mr. SMITH said he spoke against the resolution at the Council meeting, and also voted against it, and he felt that he would have to take the same course again now. He did so because these conciliation boards had not been working for very long, and the time was comparatively too short in which to judge them. It was not advisable, therefore, to tamper with their working unless the case for doing so was very strong indeed. Personally, he did not think that the case was strong enough. Mr. Hope had hit the nail on the head when he said that the men sent to these boards should be men competent to form a sound judgment, and come to a fair decision on the facts and evidence placed before them. This suggestion for an alteration came from the North, and they had heard of several cases where a vote given by one of the masters in the North had affected adversely the question before the meeting. Later on a proposal would be moved which would give members of the conciliation boards the right to private consideration before a final decision was taken, and if that were carried, he thought it would cover the present question. The fact that mistakes had been made in the North was really not a sufficient reason to tamper with a system which had worked very well in the Midlands and in the South. In his own district they had never had a case of a master giving his side away, and it was not worth altering the rules because the hard-headed men in the North sometimes possessed soft hearts.

Mr. BULLEN (Liverpool) said Mr. Smith was evidently not aware that in the decision which had given so much cause for complaint the employer who voted for the men came from as near the Midland end of the district as was possible. Mr. Hope had said that the only reason which had been given for the proposed alteration was that mistakes had been made. But that was not all. These mistakes had certainly given rise to considerable agitation, but there was a far greater reason for the change than that. By some of the arguments which had been forthcoming, and especially at the Council meeting the previous day, one would imagine that this conciliation scheme was a heaven-sent scheme which was quite impossible of improvement. He noticed particularly that the gentlemen who spoke on this matter, and had so much to say in favour of the existing system, came from districts where the Conciliation Board had never held any meetings, and where the argument one way or the other did not apply. The promoters of the alteration came from the North, where they had had so much experience of the working of the present system and its bad results that they were getting sick of it. In fact, if it were not improved, most serious results would accrue to the Federation. In the Lancashire and Cheshire districts one association had already severed its connection with the Federation because of a "scratch decision" of a northern centre conciliation board. He was at the present time using every endeavour to get them back into the fold. There was another case of a most important association, which was finding some 25 per cent. of the income of the Lancashire and Cheshire Federation, and which had threatened to sever its connection with the Federation because of its experiences with the conciliation scheme. They declared they had had enough of it, and unless it could be improved, their only course was to withdraw from the Federation. These were serious matters, and unless the scheme was revised they would continue to be faced with them. Members had remarked that the conciliation boards must not be reduced to a farce. He quite agreed with those gentlemen, and the very idea of the proposed alteration was to raise them from the farce which these boards had become at the present time. It was surely absurd to suppose that a scheme which had only just been started was impossible of improvement. He was quite sure that it could be improved, despite the "wiseacres" who had come there that day to tell them that the scheme was already absolutely perfect. There was nothing perfect on earth.

Mr. STOKES said he objected very strongly to the proposed alteration. He had had experience of the conciliation boards, and if it were rendered impossible to get a decision by a bare majority of one, it might often mean that the board would have to meet again the next day, and another day's business would be lost to all the members present. For this reason he opposed the alteration on behalf of himself and his colleagues in the Midlands.

Mr. IRWIN (Leeds) remarked that a great deal had been said about "scratch votes." He objected to the words. He refused to bind himself, before going to a meeting of a conciliation board, to the way he was going to vote. If he were not competent to sit on a board without making up his mind beforehand, then he would not sit on the board at all. He also protested against the idea of holding a meeting before the board sat. He should oppose the alteration.

Mr. MACFARLANE said that Mr. Shepherd had spoken purely from the London point of view. He had, therefore, had very little to do with the National Conciliation Scheme, and that gentleman's experience should not be counted against the experience of actual members of conciliation boards who desired the alteration.

Mr. SHEPHERD: The principle is the same.

Mr. MACFARLANE: I wish to speak on the broad question of results. No member of the Northern Federation wishes to make these boards simply automatic machines; our desire is to keep them as conciliation boards. It is a question of justice and fair play to the towns affected by the decisions arrived at. Not only is the town in which a wrongful decision is given affected, but it affects other towns in the same area. Generally the question before the concilation boards involves a dispute about wages; and where injury has been done by the decision of a conciliation board, it invariably has been in the direction of higher wages. Mr. Storrs has said that he would not jeopardise the success of the conciliation board scheme; neither would I, but let us get our machine in the best working order. This matter is a serious one, and it affects the well-being, I may almost say, the life, of the Federation. (Cries of "No! no!") You may say "No! no!" but we who have had experience know better. We know that associations in the north have been killed by decisions of conciliation boards, and the greatest difficulties are threatening because of them, and if you who have no trouble are so hard hearted as not to give way in the matter, the position will be a serious one indeed.

The meeting then proceeded to vote on the proposed alteration, with the result that it was lost by the narrow margin of thirty-five votes to thirty-eight. The CHAIRMAN announced the figures amid loud cries of "scratch vote," and applause.

The following new rules were then proposed by Mr. MACFARLANE and carried:

Period for which a decision shall endure. —"That it shall be the duty of every Board of Conciliation when giving a decision to take into consideration the desirability of stating a minimum period for which such decision is to endure."

Private Consultation at Board Meetings. —"That should either side desire to retire for private consultation during the sitting of any of the Boards after hearing the evidence, they shall be allowed to do so."

Mr. SMETHURST asked whether it would be competent for them to go forward and discuss the above matter at the meeting of the conciliation board, which was to be held in May, and which would include both employers and operatives, and whether they could take a verdict upon it. He pointed out that under rule 19 of the Building Trades Conciliation Boards any party desiring an alteration of the rules should give six months' notice in writing to the joint secretaries of the National Board prior to the annual meeting, and that such notice should at once be communicated to all parties to the agreement, and the National Board should have power to alter the agreement by a majority of votes of those present at the annual meeting. That notice, he said, had been duly given, and it would be under the consideration of both parties. The northern centre had given notice through the secretary of the Federation, and it would be circulated as an amendment to the rules. As he understood, the Northern centre would be able to go forward with that proposal, despite the vote just given.

The CHAIRMAN said he saw no reason why it should not be discussed.

The SECRETARY, in answer to a question, said that due notice of the alterations had been given to both himself and the operatives secretary.

Mr. WRIGHT (Derby) thought Mr. Smethurst's contention was perfectly correct. The vote which had just been taken only affected the National Federation. The Northern centre could act independently.

Mr. STORRS said that if the National Board met, and one side voted solid for the alteration and the other against it, the proposal would fall to the ground, because their Federation, which was really the head of the Conciliation Board, did not give the requisite consent.

The CHAIRMAN: That is the way I take it.

Mr. MACFARLANE: There is a provision in the rules for the alteration of the rules by members of the Conciliation Board. We wanted the authority of the Federation behind us, and we have got it by thirty-five votes to thirty-eight. (Loud laughter.)

The matter then dropped.

Election of Executive Council, &c.

The Secretary announced the following elections for 1909:—

Executive Council.

Elected members:—*Northern Centre.*—Northern Counties Federation: Messrs. T. Wilkinson, Middlesbrough; S. Easten, Newcastle-on-Tyne; John Proud, West Hartlepool. Yorkshire Federation: W. R. Thompson, Dewsbury; W. G. England, J.P., Barnsley; A. J. Forsdike, Sheffield; W. T. Ledgard, Leeds; J. Biggin, Sheffield. Lancashire and Cheshire Federation: T. Hartley, Blackpool; Jas. Storrs, J.P., Stalybridge; H. Matthews, J.P., Manchester; W. Johnson, J.P., Wigan; J. Hamilton, Altrincham; W. Tinker, Manchester; J. B. Johnson, Liverpool; W. Bullen, Liverpool; W. Cooke, junr., Preston; J. E. Tinline, Bury; F. Woods, Bolton. *Midland Centre.*—Arthur Chambers, Leicester; F. G. Whittall, Birmingham; F. A. Fish, Nottingham; J. Barnsley, J.P., Birmingham; W. Winstance, Walsall; H. Willcock, Wolverhampton; A. S. Smith, Birmingham; H. Smith, West Bromwich. *South-Eastern Centre.*—London Federation: Wm. Lawrance, London; J. W. Lorden, London; T. Gregory, London; F. L. Dove, L.C.C.; F. Maitland May, London; J. Carmichael, London; S. B. Depree, London; A. W. Turnbull, London; F. G. Rice, London; Fredk. Higgs, London. Eastern Counties Federation: J. Bell, J.P., Cambridge; Great Yarmouth president. Southern Counties Federation: W. F. Wallis, Maidstone; H. Marshall, Southampton. *South-Western Centre.* — South-Western Federation: H. Passmore, Exeter; E. W. Wooster, Bath; E. J. Neale, Bristol; W. P. Lewis, Hereford; W. F. Drew, Stroud. South Wales Federation: W M. Blackburn, Newport, Mon.; J. E. Turner, Cardiff; D. Williams, Pontypridd. Dublin: R. Denne Bolton. Belfast: R. B. Henry, J.P. Scottish representatives (honorary members): Hector MacVinish, Inverness; Jas. Leslie, Aberdeen. Representatives on the Employers' Parliamentary Council: The President (Ernest J. Brown, London), and Wm. Shepherd, London.

National Board of Conciliation.

Nominations for the National Board of Conciliation were received, and the following election made; members to take office in May next:—*Northern Centre.*—Northern Counties Federation: Messrs. T. Wilkinson, Middlesbrough; J. W. White, Sunderland. Yorkshire Federation: A. W. Sinclair, Scarborough; J. Biggin, Sheffield; W. R. Thompson, Dewsbury. Lancashire, Cheshire and North Wales Federation: Jas. Storrs, J.P., Stalybridge; S. Smethurst, J.P., Oldham; George Macfarlane, Manchester. *Midland Centre.*— J. Barnsley, J.P., Birmingham; J. H. Walker, Derby; H. Willcock, Wolverhampton; J. H. Kellett, Leicester; A. Brazier, Bromsgrove. *South-Eastern Centre.*—H. Marshall, Southampton; J. Bell, J.P., Cambridge President. *South-Western Centre.*—Wm. Thomas, Cardiff.

The Parliamentary Council's Report.

The report of the Employers' Parliamentary Council for 1908 was presented. In this it was stated that the operations of the Council during an exceptionally protracted Parliamentary year were, with one important exception, confined to watching the proceedings in connection with, and resisting the progress of, various Bills containing provisions which were either detrimental to employers' interests, or which sought to establish new arrangements in the conduct of industrial undertakings that would be prejudicial to trade and labour. The exception was with respect to the Coal Mines (Eight Hours) Bill—a Government measure, brought in at the instance of the Miners' Federation, to provide for a compulsory eight-hours day in coal mines. The Council held special meetings to consider the Bill, and resolved to co-operate with the Coal Consumers' Defence League in opposing this measure, which would result in a heavy burden being placed upon the whole coal-consuming community, to say nothing of establishing the principle of State interference with the hours of labour of full-grown men, and of proving a sure stepping-stone to legislation to regulate hours and wages generally. The Council did everything in its power to encourage opposition to the Bill, which, however, was allowed to pass into law with only a slight amendment which will have the effet of extending the working day by about half an hour on the average. It is further recorded that in the Parliamentary session which began on January 29th, 1908, and ended on December 21st, 1908, the Executive Committee issued weekly to the chairmen and secretaries of employers' associations, Members of Parliament, and others, a list of Bills opposed by the Council, showing the purpose of each Bill, the Council's objections to the Bill, the names of Members of Parliament introducing it, and the stage reached. During the Session, constant communication was kept up with Members of Parliament favourable to the views of the Council, and to those Members the best thanks of employers are due for their courteous co-operation with the Council on all occasions when it was necessary to give effect to the Council's opposition to these measures. It is satisfactory to be able to report that many of these measures, having been persistently opposed, were defeated, dropped, withdrawn, or lapsed owing to the Prorogation intervening. The Council, having been supplied with a summary of the evidence offered by workpeople to the Parliamentary Fair Wages Committee, carefully considered the demands made in this document, and sent to the Committee a memorial in reply, in which a protest was entered "against the idea that 'the trade-union rate of wages,' as such, should be considered as in any way binding upon a contractor. . . . To require any contractor to pay the trade union rate of wages simply because it is the union rate is to hand him over gagged and bound to a small body of men who could easily ruin him if they wished to do so. The further suggestion, that a firm which may have removed its factory 'to a more or less rural district' is to be forced to pay the trade union rate current in the nearest town, is still more monstrous. Many firms have gone to very considerable expense in the last few years for the purpose of establishing their works away from big towns; and the conditions suggested really mean that their expenditure in this respect is to be thrown away by their being deprived of one of the main advantages of working in a rural district." The subsequent report of the Committee shows that the Council's representations, especially on the question of forcing employers to pay the trade union rate of wages, have not been without influence.

Mr. SHEPHERD, in moving the adoption of the report, said that the kernel of it was contained in the introduction. If members would read it, they would realise the difficulties which were experienced, through the political position of the present day, in getting proper consideration of any of the principles which were involved in legislation or the consideration of the interests of persons affected by legislation. The one idea which seemed to pervade both political parties at the present time was the means by which they could secure votes for one party to remain in power and the other party to displace them. In the meanwhile, the interests of the general public were absolutely ignored and sacrificed. Those present would remember that last year the Trades Disputes Bill was before Parliament. The Employers' Parliamentary Council interviewed the Opposition members of the House of Lords, who expressed themselves as antagonistic to the proposals and principles involved in the measure, and when the deputation retired they had every reason to believe that when the matter came before the House of Lords they would give effect to their convictions. Instead of that, the Lords, for reasons of political expediency, allowed the Bill to go through! The same thing had occurred with regard to the Miners' Eight Hours' Bill. Every leading member of the Opposition expressed adverse opinions on the Bill; but when they had to decide the question, they simply said: "We will make the present Government responsible for a proposal which is so detrimental to the interests of the general public, and will assist them to bring it into operation!" He had referred during the meeting to something being a farce, but surely legislation under these circumstances was an absolute farce.

The CHAIRMAN: A political farce.

Mr. SHEPHERD, continuing, said that the questions before Parliament were not determined upon the basis of principle in any sense. He was sorry that they, the Parliamentary Council, had not been more successful in their efforts to prevent the passing of legislation which was detrimental to the true interests of the country. But they had done their best under the circumstances, and he had no doubt that, if they had not entirely achieved their objects, they had to some extent ameliorated legislation, which otherwise would have been more prejudicial than was actually the case. At the end of the report they would see a number of Bills, private and public, which had been brought forward, but which, owing to the daylight which had been thrown upon them and the subjects upon which these Bills proposed to legislate, had not succeeded in becoming law. It behoved the Council, however, not to relax their efforts in procuring the legislation they desired, because if they did they would be simply allowing things to go by the board. If there was no interest taken in upholding the rights and liberties of every individual in the community, and in opposing detrimental proposals, things would sink back to a far worse state than they were in at the present time. He would recommend them to read carefully that portion of the report which dealt with Fair Wages Committee. Upon that report the Employers' Parliamentary Committee made strong representations to the Secretary of State. These, and other representations, were considered, and some mitigation was obtained. The character of the Bills opposed by the Council was quite sufficient to justify that opposition. There was no doubt, however, that all those Bills would be revived; and unless some very exciting matters came before the House of Commons, they might be pushed forward, together with many others which would be promoted in the ensuing session of Parliament. Whether the great question of the House of Lords was going to absorb the whole time of the House of Commons, he did not know, but to an outsider like himself the idea seemed an absurdity. The Employers' Parliamentary Council, however, made up as it was of representatives of nearly all the industrial corcerns in the country, would continue in its endeavours to justify its existence.

Mr. RHODES seconded, and said they all thanked Mr. Shepherd for the able way in which he looked after the interests of the building trade as a member of the Employers' Parlimentary Council. He asked whether any steps had been taken in the matter of the representation of employers of the Federation on the panels of the new Arbitration Court.

Mr. SHEPHERD replied that the Council would continue to press the matter. They had made representations to the Board of Trade, and they would not relax their efforts.

The report was adopted, and votes of thanks were passed to Mr. Shepherd, Mr. C. H. Barnsley, and Mr. Greenwood for their services on the Parliamentary Council.

Election of President.

Mr. C. H. BARNSLEY proposed the election of Mr. E. J. Brown (London) to the presidential chair for the ensuing year. It was not necessary, he said, for him to employ many words in recommending Mr. Brown to that position. He had passed through the chair of the London Master Builders' Association, and that was an office which required a man of wide experience. Mr. Brown was a man of energy and enthusiasm, which were very important qualifications for the chairman of such a Federation as theirs, and moreover he possessed great commensense. They all knew the active part he had taken in reference to the BUILDERS' JOURNAL. Although the Journal Committee did its very best, Mr. Brown personally interested himself in the early negotiations, which he was sure they would all agree had been brought to a successful issue. He had no hesitation in recommending Mr. Brown with perfect confidence to fill the presidency for the ensuing year.

Mr. STORRS seconded, and Mr. Brown was unanimously elected to the chair.

Mr. Barnsley having vacated the chair in favour of the new president, and placed upon him the chain of office,

Mr. BROWN returned thanks for his election. He thanked the meeting for the cordial way in which they had elected him to the office, and assured them if he could only live up to one-half of the kind things Mr. Barnsley had said of him he should be a proud man. It was true he had been "through the fire" in London, but if he had not been through it he would never have been in a position to accept the proud distinction of the presidency of their Federation that day. He thought the arrangement they had in the Federation and in most of its centres which rendered it impossible for a man to leap suddenly into a high position from the ranks was a most excellent one. It was only right that a man should work up step by step, because then when he finally obtained the honourable position which he himself held that day he felt more able to grapple with the duties he had to carry out. Federation was a difficult thing to learn. None of them knew what it really meant yet; but they were learning more and more every day. There were many things connected with the Federation which to his mind were burning questions, and first of all came the question of organisation. It was an easy thing for them to sit there and attempt to preach the gospel of organisation; but to carry out the propaganda and work to that gospel was another matter altogether. There were some parts of the country which were gradually sliding away not only from Federation but from Association work. He considered that a most deplorable state of things; and it was the first duty of the Administrative Committee to take up seriously the question of how to bring these parts of the country back to the fold. In this connection he especially referred to the southern and south-eastern districts. How it was to be done was truly a difficult question; but the Administrative Committee must use every means in their power to bring about the desired result. He could not sit down without reminding the meeting of his pet scheme—the journal. Twelve months ago he had the pleasure of introducing the BUILDERS' JOURNAL at that table, and he threw out a mild suggestion at the time that there was something ready-made for the Federation instead of laying down their tools of the building trade to take up those of the printing trade. In the BUILDERS' JOURNAL they had a ready-made paper with all the appliances and appurtenances at hand—a paper which could represent them in every possible way. After many negotiations and much argument—not many lawyers he was glad to say—the scheme was carried through, with the result that the Federation now had its journal. (Applause.) It would not do for them to think, however, that by the mere fact that they had secured a paper to represent them that was going to make a success of their journal. He hoped that not only would members of the Federation subscribe to the paper, but that they would also induce their friends to subscribe; that they would also advertise the paper in every possible way, and make people understand that it was a channel through which business was to be obtained. Reports of all they said and did would appear in this journal; and the knowledge made one somewhat careful and nervous of what he did say. He could not help recalling the words of Robert Burns:

> "If there's a hole in a' your coats,
> I rede ye tent it;
> A chiel's amang ye takin' notes,
> And, faith, he'll prent it!"

Mr. Macfarlane would tell him that was not Scotch.

Mr. MACFARLANE: You're aiming at it!

Continuing, Mr. BROWN said he hoped the journal would be taken up this year with more enthusiasm, and he hoped the local secretaries would put their shoulders to the wheel to make the scheme go. If it did, he would look forward to the time when they would not have to subscribe, but when it would pay for itself out of the profits, and put a substantial sum by in the reserve fund into the bargain. Passing on, the speaker said that when he looked at the chain he was now wearing and read the names engraved upon it, he could not help feeling that they owed great thanks to those who had preceded him. The Federation had been supported in the past by strong men, many of whom he was glad to say still remained with them in the Federation. He was perfectly certain that so long as they had such men among them and were able to profit by their counsel, they could not go far wrong. He urged those present to make it their earnest endeavour to serve the Federation as well, if possible—they could not do it better—as those who had preceded them, whilst for himself he would do his utmost.

Mr. STORRS proposed a vote of thanks to Mr. Barnsley for the efficient manner in which he had presided over them during the past year, and he moved that that gentleman's name should be added to the list of honorary vice-presidents.

Mr. MACFARLANE seconded, and the motion was unanimously carried.

Mr. BARNSLEY, in returning thanks, remarked that he had always endeavoured to do his best in the interests of the Federation, and would continue to do so.

The following officers were also elected:—Senior vice-president, Councillor S. Smethurst, J.P., Oldham; junior vice-president, J. W. White, Esq., Sunderland; hon. treasurer, James Wright, Esq., Nottingham; hon. auditors, F. Higgs, Esq., London, W. Thomas, Esq., Cardiff. Representatives on the Employers' Parliamentary Council, E. J. Brown, Esq., London, and Wm. Shepherd, Esq., London.

Next Half-yearly Meeting.

On the invitation of the president of the Portsmouth Association, it was decided to hold the next half-yearly meeting at Portsmouth.

Other Business.

The SECRETARY explained that there was other business before the Council on the previous day which did not appear on the agenda, as it came to hand too late to be printed. It might perhaps be convenient to the members if he briefly stated what the business was. There was a report about the National Form of Contract. It would be remembered that at the last half-yearly meeting resolutions were passed with regard to extending the adoption of the agreed form of contract, and to approach the R.I.B.A. in the matter. This had been done and a report had been made, but the President had reported that there was an amendment under discussion between the Builders' Institute and the R.I.B.A. as to clause 30 of the contract. The Council, therefore, decided that the suggested action as to circularising the various public bodies with regard to the use of the contract should be temporarily suspended. Mr. Hope had suggested that the Administrative Committee should consider how the contract had worked, and whether amendments from the builders' side were required. He (Mr. White) understood that Mr. Hope's suggestion amounted to this: that they were to ask for a report from the Federation as to any experience which they thought should lead to an amendment of the contract, and that the Administrative Committee should consider any reports received, so that action could be taken while clause 30 was on the tapis. Further, it was decided to ask the Builders' Institute not to arrive at any decision on clause 30 without first consulting the Federation. The International Trades Exhibition had sent an invitation to the Council which included members generally. It stated that from April 17th to May 1st an important and representative building exhibition would be conducted at Olympia, and invited members of the building trade to pay a formal visit, the date to be decided by the Council. If the invitation was accepted, the Exhibition Committee would be pleased to send tickets of admission. The Council had instructed him to accept the invitation, and arrangements would be made in due course. As regarded the tabulated statement of wages, the matter had been looked into in response to the request of the Lancashire and Cheshire Federation, and arrangements were being made with the BUILDERS' JOURNAL to reprint from time to time, probably once in six months, a list of wages and hours of labour in the Federated towns. With regard to schedules of quantities, a resolution was brought before the Council from the Midland centre, and referred to the Administrative Committee for consideration, also one from the Lancashire and Cheshire Federation as to Government departments not issuing quantities in certain cases. A letter from the Warrington Master Builders' Association was also receiving attention, and a resolution from the Yorkshire Federation with reference to wages boards had been remitted to the Employers' Parliamentary Council with a request to take the matter up. A letter with reference to the Housing and Town Planning Bill from the Yorkshire Federation had also been referred to that Council.

In answer to a query by Mr. Easten (Newcastle) in reference to the decision of the Administrative Committee to suspend their operation in regard to local authorities and the form of contract,

The CHAIRMAN said he did not think it need tie the hands of the local Federations in any way.

Mr. EASTEN (Newcastle-on-Tyne) said he did not want the action of the Council in suspending their proposed canvass of the various public bodies for the adoption of the contract to interfere with the individual action of localities. He wanted them to go on pressing for the contract just the same as if the proposed amendment of the R.I.B.A. had not occurred.

Mr. LEVER (Liverpool) asked when something was going to be done to better prices. There had been a great outcry about this, he said, but many members were afraid to take the matter up individually. He thought the opinions of the Federation might be obtained on the matter, and embodied in a report. He did not think trade would be so bad if, instead of cut-throat competition, they were to go in for getting fair remuneration. Something ought to be done, for the position of affairs in the North was very bad.

The CHAIRMAN: The first thing to be done is to get every contractor into the Federation. It is the outside men who cut the prices.

Mr. LEVER thought the fault lay quite as much with those inside the Federation.

Mr. GREENWOOD: We are all thoroughly in sympathy with the member's object. I would suggest that he should formulate a scheme which might be submitted to the Administrative Council to see whether it is practicable or not.

Mr. SMETHURST said that a scheme was absolutely impracticable. The Lancashire and Cheshire Federation had circulated a letter pointing out the inadvisability of cutting prices, but that was the best that could be done in the matter. It was impossible to make arrangements by which men could be bound, because the whole thing was too complicated. They could only use moral persuasion.

Mr. J. W. WHITE objected to the idea going forth that it was the intention of the Federation as a body to raise prices. The matter was one which must rest with the members themselves. If people would continue to do work at less than cost price, they were bound to come to a standstill at some time.

Mr. DAVIDSON instanced an experiment in the North which had proved successful. The local authority would not recognise the masters' prices. As a result, the local Association sent a deputation to the local authority and pointed out that the authority had passed a fair wages clause. They then argued that if it were right for the protection of the operatives that this clause should be passed, it was equally fair and equitable that the local authority should recognise the employers' trade prices. He was glad to say that this argument convinced the authority, who recognised the masters' claims.

The conference then concluded.

THE STABILITY OF WALLS.

By Henry Adams, M.Inst.C.E. etc., Member of Council, The Society of Architects.

(*Concluded from p. 92, No. 730*)

Anomaly in Buttresses.

A very curious anomaly occurs in connection with these buttresses, which would not be credible except for mathematical proof. An illustration will explain. Assume a 9in. brick wall 6ft. high and consider a length of 12ft. unattached; let the brickwork weigh 1cwt. per cub. ft. and the wind blow horizontally with a force of 28lbs. per sq. ft. at right angles to the face.

Then the maximum stresses on the base will be $\frac{W}{A} \pm \frac{M}{Z} = \frac{12 \times 6 \times {\cdot}75 \times 112}{12 \times {\cdot}75} \pm \frac{12 \times 6 \times 28 \times 3}{\frac{1}{6} \times 12 \times {\cdot}75^2}$ $= 672 \pm 5376 = 6048$ lbs. per sq. ft. compression, and 4704 lbs. per sq. ft. tension. Now add a buttress 18 in. wide and projecting 4½ in. in the centre as in Fig. 13. The section modulus will be

$$Z = \frac{BD^2bd^2)^2 - 4BDbd\,(D-d)}{6\,(BD^2 - bd^2)} =$$

$$\frac{\times \quad 1{\cdot}125^2 - 10{\cdot}5 \times {\cdot}375^2)^2 - 4 \times 12 \times 1{\cdot}125 \times 10{\cdot}5 \times {\cdot}375\,(1{\cdot}125 - {\cdot}375)^2}{6\,(12 \times 1{\cdot}125^2 - 10{\cdot}5 \times {\cdot}375^2)} = \frac{68{\cdot}4}{82{\cdot}3} = 0{\cdot}83.$$

Then $\frac{W}{A} \pm \frac{M}{Z} = 672 \pm 7287$ giving 7959 lbs. per per sq. ft. compression and 6,615lbs. per sq. ft. tension, or an increase in the maximum stresses of 30 per cent. in compression and 40 per cent. in tension by adding the buttress. The loss of strength does not continue in proportion to the size of buttress added, but soon reverses, as will be seen by the curve diagram Fig. 14 (January 27th). The facts give some food for reflection as to the advisability of these piers in ordinary cases.

A Corrugated Boundary Wall.

An economical and ingenious boundary wall may be seen at Easton Park, Wickham

Market, Suffolk. It is corrugated in plan, the double bend between tangent points being 20ft. 9in., with a rise of 2ft., and although it is 9ft. 2in. high it is only 9in. thick, and has been standing safely for many years. The calculations for stability are as follows:—Draw plan Fig. 15 (Feb. 3), divide into segments, project force lines from centroid of each towards Fig. 16, mark area 1 to 5 in Fig. 17, and at right angles draw 1—0 = half 1 — 5, and draw vectors. Then parallel to the vectors across the spaces in Fig. 16 draw the inertia area *a*.

Let A = total area, then moment of inertia $I = Aa = 16 \times 0{\cdot}64 = 10{\cdot}24$ feet units, and $Z = \frac{I}{y} = \frac{10{\cdot}24}{1{\cdot}375} = 7{\cdot}44$. Ratio $\frac{W}{A} = \frac{112 \times 9\frac{1}{6}}{1} = 1026$ lbs. per sq. ft., and for a maximum stress of 3 tons per sq. ft., $\frac{W}{A} + \frac{M}{Z} = 3 \times 2240$; $\frac{W}{A} = 1026$, therefore $\frac{M}{Z} = 6720 - 1026 = 5694$, whence $M = 5694 \times 7{\cdot}44 = 42363$ lb.-ft. The leverage of the wind pressure $= \frac{9{\cdot}16}{2} = 4{\cdot}58$ ft., therefore $\frac{42363}{4{\cdot}58} = 9249$ lbs. total allowable pressure. Area of unit of wall $= 20{\cdot}75 \times 9{\cdot}16 = 190{\cdot}2$ sq. ft., giving the maximum wind pressure per sq. ft. $= \frac{9249}{190{\cdot}2} = 48{\cdot}56$ lbs. With this wind pressure the stress on the inner edge will be $\frac{W}{A} - \frac{M}{Z} = 1026 - 5694 = -4668$ lbs. or 2·085 tons per sq. ft. tension, whence it appears that the maximum safe wind pressure is 48·56 lbs. per sq. ft. for a maximum compression of 3 tons per sq. ft. and tension of 2 tons per sq. ft.

Panelled Walls.

Panelled walls, Figs. 18 and 19, may be desirable on account of appearance, but they involve extra labour, and their weight being reduced they have less stability than a solid wall. They would be calculated at the base the same as a solid wall of the reduced weight, at the top of plinth in the same way, and at base of panel the same as a wall with buttresses and counterforts.

Walls with Set-offs.

By making a series of set-offs on each side of a wall 30ft. high, at heights of 7ft. 6in., about 20 per cent. may be saved in the bulk above ground line, as shown in Figs. 20 and 21, but the extra cost of blue brick weathering at each set-off must be added, together with the increased cost of wider foundations, to obtain the same life and stability, so that no ultimate saving would result from this form of section.

If the set-offs are all on one side of the wall the wall will be more stable than above with the wind on the plain face, and less stable with wind on the set-off side, owing to the shifting of the centre of gravity.

Foundations.

The ordinary concrete foundation under a wall consists of Portland cement concrete, 1 cement, 2 sand, 5 aggregate, projecting 6in. on each side of bottom course of footings and 9in. thick. The 6in. projection arises from the allowance given in the excavation for the bricklayer to get at his work and the thickness is settled upon no rule whatever. It is desirable that some general rule should be adopted and the author suggests the method shown in Fig. 22. Approximately it may be taken as

Projection of concrete = ½ thickness of wall.
Depth concrete = thickness of wall.

House Walls.

Roundelet, a century ago, undertook a scientific investigation into the proper strength of house walls, and he based his calculations largely upon an examination of ancient Roman walls which had withstood the storms of eight or ten centuries. Among these, the walls of Hadrian's palace at Tivoli had a thickness of one-sixteenth their height, and that, Prof. Unwin states, is not widely different from the thickness which would now be required in strong and lofty buildings. Gwilt gives a formula for the thickness of brick walls as follows:—

$$T = \frac{HL}{ND} \quad\ldots\ldots\ldots\ldots\ldots\ldots(23)$$

where T = thickness in ft., H = height in ft., L = length between party or cross walls in ft., D = diagonal of length of wall by scaling or $\sqrt{H^2 + L^2}$, N = constant = 22 for dwelling houses, 20 for warehouses, 18 for public buildings, increased to 27, 23 and 20 respectively when H is less than ½L. Rubble stone walls to be ⅓ thicker than those of brick.

His rules for modern use can be put into a formula as follows:

$$t = \frac{Lc}{\sqrt{L^2 + H^2}} \quad\ldots\ldots\ldots\ldots\ldots\ldots(24)$$

where t = thickness of wall in ft., H = height in ft., L = length of wall in ft., c = constant = $\frac{H}{12}$ for warehouses, and $\frac{H}{20}$ for dwelling houses. Graphically it may be worked as shown in Fig. 23.

According to Mitchell's "Brickwork and Masonry" (2nd edition, p. 195) it has been stated by an "eminent authority" that he should consider a wall overhanging 1 in 24 not unsafe, and dangerous when it overhangs 1 in 12; but, from the principles which have been placed before you this evening, it is clear that any statement of this kind is irrational, unless made in connection with a wall of a given height and thickness, as the stability will be affected by both these dimensions when the rate of overhang is constant.

The author trusts that, while he has given the material for a full consideration of the subject, he has reduced the matter to the utmost simplicity for practical use, by suggesting that plain fence walls should have a minimum thickness of one-ninth of their height.

Trade and Craft.

The Carron Company.

Founded in 1759, Carron Company, iron founders, coal masters, engineers, ship owners, etc., of Carron, Stirlingshire, has now reached the 150th anniversary of its foundation with an unbroken and continued business career throughout that long period of time. Practically the pioneers of the iron industry in Scotland, Carron Company has well earned and deservedly holds a world-wide reputation for the excellence of its manufactures of every description of cast iron goods, such as ranges, grates, stoves, cooking apparatus, baths, and lavatories, railings, stable fittings, gas appliances, etc., suitable alike for the mansion or cottage homes of this country, or the camps and bungalows of other climes. Many awards have been made to Carron Company during the past sixty years, and at the Franco-British Exhibition in 1908, a Grand Prix was awarded the Company for excellence in design and workmanship—a proof that after a century and a half of existence the manufactures of this old Corporation still maintain their high level of excellence.

Indented Bars.

These bars are just now being used in connection with the building of Sessions Register House, at Edinburgh. Indented steel bars are also being used on an extensive scale as reinforcing material in connection with works under supervision of the Resident Engineer, Glasgow Main Drainage Works. They are also being used exclusively as reinforcement for the new sea defence works which are being carried out by Mr. W. E. Blake, contractor, of Plymouth, for the Teignmouth Urban District Council. The address of the Indented Steel Bar Co., Ltd., is Queen Anne's Chambers, Westminster.

A curious statement has been made with respect to the roof of Chesterfield Church. It is estimated by some that this part of the roof has remained untouched for a matter of six hundred years. The men engaged in stripping the ceiling are inclined to endorse this extraordinary statement. At any rate, it is certainly very old-fashioned workmanship. The whole of the roof is composed of oak beams supporting leads. The spars to which the plaster-work is attached are also of oak, but are very wide apart as compared with the present-day method of sparring. Laths there are none, their place being supplied with particularly thick, strong rushes, which crinkle and crack with dry old age as the men tear it down. The roof itself is quite sound and safe, but here and there are holes through which the sky may be seen, and through which rain has apparently often percolated. It is not proposed to supersede the ceiling with plaster work, but to underdraw with oak boards.

South-Eastern Centre—WM. SHEPHERD (London). W. F. WALLIS (Maidstone). B. I. GREENWOOD (London). J. BELL, J.P. (Cambridge).

South Western-Centre—Coun. W. N. BLACKBURN (Newport, Mon.). E. J. NEALE (Bristol).

Secretary:
A. G. WHITE, 31 and 32, Bedford Street, Strand, London, W.C.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

The annual general meeting of the National Federation was held on January 27th in the Balmoral Room of the Trocadero Restaurant, Piccadilly. A full report of the proceedings has been prepared, and the first instalment of it appears on p. 121 of the present issue. The thirty-first annual report, which is too long for insertion here, deals with the state of trade, which still shows no improvement, and with other matters mentioned below. As to the working of the Conciliation Boards, the following remarks are made:—Conciliation Boards: The National Board has held three meetings during the past half-year. The cases considered were:— Appeal of Carpenters and Joiners and Bricklayers of Southampton: No decision on the question at issue, viz., an advance of wages, was given by the Board, but the parties were recommended to arbitration. Appeal of Carpenters and Joiners of Rochdale: No decision was given on the main issue, viz., an advance of wages, but a decision was given as to the notice rule. Appeal of the Carpenters and Joiners of Manchester for an advance of wages was re-heard and decided in favour of the employers. Appeal of the Employers at Leicester as to correct Interpretation of Rule as to area of the Leicester District: Decision given in favour of the workmen. Working of the Conciliation Scheme: The Northern Counties Federation report that the experience of the working of the conciliation scheme in their district has been satisfactory. The Tyne and Blyth District Board, since the inauguration, has been used by the operatives for a settlement of a variety of disputes, including some which would otherwise have been settled in the county court. Thirteen meetings have been held since its inauguration. In Sunderland the Conciliation Board has worked smoothly, though there is a strong desire on the part of the operatives to extend the area of the Board's jurisdiction beyond that of the employers' association. Three meetings have been held. The Teesside's experience has also been satisfactory. In addition to the annual meeting only one case has been brought forward. The Middlesbrough bricklayers asked for an interpretation of the Walking Time Rule. Two meetings were held, the decision being in favour of the employers. The Northern Centre report having held six meetings, given eight decisions, and once failed to decide. The Midland Centre having held four meetings, given two decisions, and twice failed to decide. Birmingham District Board also settled two disputes. The S.E. Centre report two meetings, one decision and one failure to decide. Proposals for amending the conciliation rules and for affording facilities for builders' labourers to participate to some extent, are also mentioned. The reserve fund is making satisfactory progress. As the result of certain statistical returns, it is stated that: "It is quite evident that an insufficient number of apprentices are being made to meet the future requirements of the various trades, especially in regard to masons, bricklayers, slaters, and tilers, plasterers and painters. Complaint is made as to the inquisitional character of the information demanded under the Census of Production Act, and a simplification of the forms is desired. A model clause for use as a fair wages clause in contracts is under consideration. A special committee has reported on the working of the agreement with the National Association of Operative Plasterers, and the result of their labours is given in the report of the proceedings at the annual meeting. Reference is made to the active steps which have been and are being taken to bring the Official Journal to the notice of the membership. Among the other subjects dealt with are:—Matters connected with the Coal Mines (8 hours') Bill; the International Congress of Builders at Paris; the Agreed Form of Contract; Compulsory State Insurance; the protection of a member at York whom it is sought to hold responsible for defects in materials supplied from a specified manufacturer; the Court of Arbitration, and the constitution of its panels; return under the Workmen's Compensation Act; Municipal Works Department at Leeds, and the progress of organisation. Particulars of demands made and concessions granted in various cities and towns during the past half-year are also given. The accounts show the financial position of the Federation to be in every way sound.

THE NORTHERN CENTRE OF THE NATIONAL FEDERATION

COMPOSED OF

The Lancashire, Cheshire and North Wales Federation, The Yorkshire Federation and The Northern Counties Federation.

Secretary: JAMES DENVER, Cromwell Buildings, Blackfriars Street, Manchester.

The annual general meeting of the Northern Centre Executive Council was held at the Salisbury Hotel, off Fleet Street, London, on Monday afternoon, January 25th, at 5.30, when Mr. Henry Matthews, J.P., Manchester, presided over the commencement of the proceedings, and there was a good attendance.

The minutes of the last quarterly and of the special meetings were read and confirmed, and the accounts for the half-year ending December 31st, 1908, were passed for payment.

On the motion of the chairman (Mr. H. Matthews), seconded by Mr. T. Wilkinson, Councillor Stephen Easten, Newcastle-on-Tyne, was elected president of the centre for the ensuing year. Councillor Easten then took the chair, and returned thanks to the meeting for electing him to that position.

A vote of thanks was passed to the retiring President for his services during the past year, which Mr. Matthews suitably acknowledged.

Mr. A. J. Forsdike, Sheffield, was elected senior vice-president, on the motion of Mr. H. Matthews, seconded by Mr. W. R. Thompson; and on the motion of Councillor S. Smethurst, seconded by Mr. H. Matthews, Mr. George Macfarlane, Manchester, was elected junior vice-president. Mr. John Proud, West Hartlepool, was elected hon. auditor.

A letter was read from the Liverpool Association with reference to a resolution passed at the last meeting of this Centre. A long discussion ensued, and the secretary was instructed as to the reply to the letter.

The Secretary reported that several federations and associations had agreed to the suggested alterations for which this centre had given notice in the Conciliation Board rules.

The question of the allocation of the Centre subscription to the National Federation was considered, and ultimately it was agreed that the same be paid on the same basis as last year.

Some discussion took place with reference to the National Reserve Fund, but no formal resolution was passed.

The Yorkshire representatives stated that they had approached the National Federation for support in a case of one of their members with respect to liability for work he had completed some time ago, and asked this Centre to support them when the matter was considered in the National Council the following day. After hearing the full facts of the case, it was considered that the question was one of general interest to the trade, and it was agreed to support the Yorkshire Federation in the matter.

It was agreed that the Centre become subscribers to the "Builders' Journal."

Mr. J. B. Johnson raised the question of the N.A.O.P. agreement, and gave his report as the Centre representative on the Committee appointed to consider the matter.—JAMES DENVER.

THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION.

Secretary: JOHN TOMLISON, Cromwell Buildings, Blackfriars Street, Manchester.

The monthly meeting of the Administrative Committee of the Lancashire, Cheshire, and North Wales Federation was held at the Board room, Manchester, on Friday, January 8th, when the president (Mr. William Bullen) occupied the chair, and there were nine members present.

The minutes of the last meeting having been read and confirmed, the Finance subcommittee presented a report as to the future issue of the Federation Year Book, suggesting that the half-yearly reports be issued in future in book form, together with the additional information as at present contained in the Year Book. The Secretary reported that tenders had been invited for the printing, but all were not yet to hand. After giving the matter full consideration, the sub-committee were empowered to carry out the scheme accordingly.

Correspondence was read and considered on the subject of the publication of a tabulated statement of wages paid in the building trades in the federated towns, and a resolution was passed requesting that the National Federation should consider the advisability of again publishing the information.

Other matters of trade interest were considered, but no formal resolutions were passed.—JOHN TOMLISON.

A conference of secretaries of the local associations connected with the Lancashire, Cheshire, and North Wales Federation, was held at the Board room, Blackfriars Street, Manchester, on Friday, January 22nd, when the president, Mr. William Bullen, presided over a well-attended meeting.

The Chairman, in opening the meeting, explained that it was not intended at this the first meeting to have any definite programme, but every member present was invited to raise questions of general interest which they desired to discuss, or upon which they wished for information.

Mr. E. Dean, of Oldham, called attention to the model rules issued by the National Federation, and contained in the report of the Conference of Secretaries held in London in October last, and raised two or three points in connection therewith. A general discussion ensued, and ultimately Mr. Dean moved, and Mr. B. B. Moss seconded, a resolution thanking the National Council for the model set of local association rules submitted.

A general discussion took place on points of business interest, amongst which were the working of the inter-trading rule, tendering without quantities, the admission of co-operative societies as members of local associations, collective insurance, and the position of secretaries generally.

The position of the Burnley master joiners, who have formed a separate association, was also discussed, and Mr. Astwood, the local secretary, was advised to try to arrange a general meeting, so that the president and members of the organising committee can attend to explain the rules and endeavour to reunite the employers in one general association.

On the motion of Mr. B. B. Moss, seconded by Mr. R. Hall, it was decided to ask the Administrative Committee to arrange for half-yearly conferences in future.

After some discussion, the Chairman thanked the secretaries present for attending, and the representatives proceeded to the Victoria Hotel, where tea had been provided. A vote of thanks to the Federation for arranging the conference, proposed by Mr. Moss and seconded by Mr. Dean, brought the proceedings to a close.

ROBERT HALL,

Building Surveyor,

52, Frederick Street, BURY

With over 35 years practical experience of the Building Trade, and during the last 15 years a very varied experience in measuring up and adjusting contract and other accounts, is prepared to undertake and submit quotations for the following :—

The Measuring-up and Adjustment of Accounts,
Collection and Settlement of Accounts,
Assistance given in Estimating,
Annual or other Periodical Stocktakings,
Private Enquiries and Arbitrations undertaken,
or any other special work incidental to that a Builder or Contractor.

52, Frederick St., BURY.

ACCRINGTON AND DISTRICT.

Secretary pro. tem.: R. Hall.

The first general meeting of the newly-formed Accrington and District Building Trade Employers' Association was held at the Railway Hotel, Accrington, on Tuesday evening, January 19th, forty employers in the various branches of the trade being represented. The committee, which was appointed at a meeting held in December, 1908, presented a code of rules and other information in accordance with instructions. Mr. James Waddington, who had acted as chairman of the committee, was appointed chairman *pro tem.* until the rules had been adopted by the meeting. These were taken seriatim, and, with very slight alterations, unanimously adopted. Everything being then in order for the election of officers and committee, the following were appointed:—President, Mr. James Waddington; senior vice-president, Mr. Arthur Berry; junior vice-president, Mr. Foden; senior treasurer, Mr. H. Ramsbottom; auditors, Messrs. W. Walmsley and W. Ramsbottom; and a committee representative of the trades as follows:—Stonemasons, Mr. Richard Stewart; carpenters and joiners, Mr. Richard Nuttall; plumbers, Mr. James Carter; slaters, Mr. W. Walmsley; painters and decorators, Mr. J. R. Carter; plasterers, Mr. G. Eastwood. Mr. Robert Hall, organising secretary to the Federation, was appointed secretary *pro tem.* until the next general meeting in April. The question of the subscription, and application for admittance to the Lancashire and Cheshire Federation, was left with the committee to report upon. On the motion of Mr. H. Ramsbottom, seconded by Mr. Councillor Dixon, a unanimous vote of thanks was passed to Mr. Waddington for his services as chairman, and to the committee who had drafted the rules.

Clitheroe and District.

A meeting of employers in the building trade was held at the Starkey Arms Hotel, Clitheroe, on Wednesday evening, January 13th. The meeting was in answer to a circular sent out by Mr. Robert Hall, organising secretary to the Lancashire, Cheshire and North Wales Federation, who attended the meeting and addressed the members present on the importance of organisation. After a full explanation of the benefits to be derived from federation, and a very open expression of opinion from those present upon the desirability of such an association being established in Clitheroe, it was agreed that, as several employers of labour in the district had not signified their intention, either orally or by circular, to become members if an association was formed, the matter be left in the hands of the organising secretary, after paying a visit to the several members mentioned, to arrange for another meeting, when a committee to draw up the rules, etc., might be appointed.

Colne and District.

A meeting of employers of Colne and district was held at the Crown Hotel, Colne, on Monday evening, January 18th, fifteen employers connected with the building trade being in attendance. Several years ago there existed in Colne a very strong employers' association, but it had been allowed to lapse. It was unanimously agreed that Mr. James Laycock, who formerly acted as secretary to the old association, should join the organising secretary in a campaign of visitation to those employers in Colne who were not present, and arrange for another meeting at as early a date as possible, when a committee could be appointed to draw up the rules.

BARROW-IN-FURNESS ASSOCIATION.

Secretary: J. Baker.

The monthly meeting of the Barrow-in-Furness Association was held on Tuesday, January 26th, when the election of officers for the ensuing year took place, and resulted as follows:—President, Mr. G. Varley; vice-president, Mr. E. Banks; secretary, Mr. J. Baker; all re-elected. Mr. E. Ward was elected treasurer, in place of Mr. J. Walker, resigned.

The balance sheet was submitted and adopted.

The question of tendering for work without quantities was under consideration, and it was ultimately resolved to adjourn the matter to the next meeting.

The Secretary gave a résumé of the principal matters under consideration at the meeting of secretaries at Manchester, at which he attended, and it was thought that some of the matters referred to might with benefit to the association be considered further at a subsequent meeting.

The Secretary reported the receipt of copies of "Municipal Works Departments," as published by the Yorkshire Federation, for distribution amongst the members of the County Council.

After the business had been disposed of the remainder of the evening was spent in the enjoyment of an informal concert.

BURY AND DISTRICT ASSOCIATION.

Secretary: R. Hall.

A special general meeting of the Bury and District Association was held at the Boar's Head Hotel, Fleet Street, Bury, on Wednesday morning, January 13th, to receive a report from the honorary solicitor to the association (Mr. H. W. Chell), and the secretary respecting building clauses in the corporation's proposed new Parliamentary Bill. Mr. Chell explained that several of the clauses in the proposed Bill would very materially affect the builders and the building trade if allowed to go through as drafted. Several suggested alterations were proposed, and a small committee, consisting of the president (Mr. John Inman), Mr. James Ramsden, Mr. H. Thompson, and Mr. John Hutchinson, was appointed to confer with Mr. Chell after he had consulted with the town clerk on the proposed amendments of the several clauses, so that the association could be represented and their opinions expressed at the public meeting to be held that evening. Mr. Chell, during the afternoon, consulted the town clerk, and met the appointed committee in the evening, and then proceeded to the public meeting to state their case. Mr. Chell represented to the town clerk that in Part II. of the Bill, in dealing with the gas, there was an introduction of words which were not in the 1885 Act. They had inserted the words that they have power not only to sell, let for hire, and deal with those articles, but to fix, repair, and remove them in houses and buildings, and for that purpose to provide material and make a charge. He appeared for the master builders of the town, and it appeared to them it was taking a wide power, and a power which did not exist in the 1885 Act. Probably it might be convenient at that stage to ask the town clerk if he would say how those words came to be inserted in the section, not being in the 1885 Act. The town clerk said that the words were found in a Model Bill—Parliament's Model Bill—and that was why they were inserted there. If they had not been inserted there they would have been inserted when the Bill came to be reported upon. It was a stock clause, modelled from what was previously in private Bills, and what the Corporation had been carrying out since 1872.

Mr. Chell said it looked as though the plumbing trade was going to suffer if the fixing and repair of those things was to be begun.

The Town Clerk said it applied more to gas meters. He did not think the committee had in its mind anything beyond what it had been doing for some time. The same remarks would apply to the electricity section.

Mr. Chell said that when they came to the building clauses there was section 135, sub-section I., which stated that a person should not erect two or more houses in a row unless the front or forecourts of the houses abutted on a street already made or formed. It seemed to them that that might press very hardly on a builder who was wanting to put up any property in an undeveloped part. If he could not begin to build two or more houses until the street had been made or formed, it might seriously delay him and interfere with his business arrangements. If sub-section II. were passed no single house could be commenced or excavating done until the street was laid out and formed, and the level shown on a plan approved by the corporation. Their comment was that it was a needless restriction, and might press on builders if they had to wait for the street to be made before they could excavate their land. A builder might be removing soil from his plot, and the corporation might be carting soil on the street, whereas it would be quite easy for the builder to put his soil on the place needed for the street. It was quite conceivable that a builder might want to take advantage of a good part of the year to commence his building operations, and he might be prejudiced by that. The principle should be that where plans had already been approved and levels determined, a man might begin. They wanted to work with the corporation, and they recognised that the corporation wanted to work with them. That was the road to mutual success. All they asked was that when the levels of the streets had been fixed, and the plans approved, that they should be enabled to commence building operations. He took it from the town clerk that there would be no serious objection raised to it. It was not a question of principle, but of drafting. As regarded clause 136—"No building, not being a public building, shall be erected fronting to any street of a greater height, from the level of such street, than the width of such street"—they asked that it should be made to read that no building should be erected fronting to any main street of a greater height than the width of the street; but that that clause should not apply to a cross or back street. They might easily point to a building which fronted a street and had a front to a side street, and if the Bill were passed there would be the anomaly that it would satisfy the section on one side and swear at the section on the other side. They asked that the clause should be amended, and he understood from the town clerk there would be no serious objection made. Section 153 was very drastic if it stood in its present form. The corporation might make by-laws with respect to materials with which new buildings should be erected, and the materials with which grates, stoves, and fireplaces should be set, the construction of ovens, furnaces, etc. On that he thought there were three points. First, the provision as to grates, stoves, and fireplaces was covered by section 137 or 149—(The town clerk: 137 and 149)—and the master builders would suggest that the latter part of it be strengthened so as to vest in the corporation the power to prescribe the thickness and construction of all walls. They ought to take the responsibility of saying what the thickness and construction of all the walls should be. But it was rather drastic to give the corporation the power to make by-laws with respect to the materials with which new buildings should be constructed. That was a power which, if vested in the hands of the corporation, might be made or not adversely to the builders' interests; the corporation might prescribe not only the kind of brick, but quality of brick, or whether stone, or say what cement they were to use. He would like to say, on behalf of his clients, that they had gone through the Bill with the greatest possible desire to recognise the wishes of the corporation to equip themselves with all necessary powers to put the town, where deficient, into the best condition possible. So far as his clients were concerned they wished to co-operate with the corporation; but as business men they did not want their hands tied to such an extent. He thanked the town clerk for the courtesy with which he met them that afternoon.

The town clerk replied that, as Mr. Chell had said, he saw no serious objection to meeting the views he had so ably expressed. As he knew, he (the town clerk) had had certain marks against some of the clauses for further consideration and re-drafting, and he thought he would be able to advise the Parliamentary Committee to concede the greater part of what Mr. Chell had asked, if not the whole. He did not think there ought to be any serious difficulty in coming to an agreement.

The second annual whist drive and dance, held in the Town Hall, Bury, on January 29th, was attended by about ninety ladies and gentlemen, and was highly successful.

LLANDUDNO AND DISTRICT ASSOCIATION.

Secretary: E. P. Morris, Accountant.

The monthly meeting of the Committee of the Llandudno Association was held on Thursday, January 28th, when, in the absence of the president, the chair was taken by Mr. Henry Hughes.

The question of universal starting time was considered, and a sub-committee, consisting of the president (J. A. Thomas), Evan Hughes, Luther Roberts, and R. T. Owen, was appointed to go into the matter and report to a further meeting.

A circular from the National Federation, dealing with the shortage of apprentices, was considered, and it was decided to recommend to members the desirability of increasing the number of apprentices, and also to have all apprentices bound.

The Secretary was asked to obtain the scale of wages to boys, and also to write to various wholesale firms inviting them to become members.

MANCHESTER, SALFORD AND DISTRICT ASSOCIATION.

Secretary: John Tomlison.

The number of members to date of the Manchester, Salford, and District Association is 183.

The master plasterers and painters' branch of the association held their monthly meeting on January 12th, when Mr. James Higson presided over a good attendance of members. Applications for membership from two employers connected with this branch trade were approved, and recommended to the general committee for election.

The question of the fixing and finishing of patent plaster partitions was considered at some length, and it was decided that the committee should meet representatives of the manufacturers with a view to some arrangement being made.

Several fines were imposed on members of the branch for failing to attend a reasonable number of meetings in accordance with the rule.

Several other matters connected with the trade were considered, and resolutions passed.

The stonemasons' branch met a deputation from the operatives at the board-room, Blackfriars Street, on January 13th, to consider matters arising under the notice given by the employers for a reduction in wages and several alterations to the working rules. After some discussion, the employers agreed to the discharge notice being inserted in their notice as contained in the present rules. It was also agreed that, in the case of a dispute which is referred to the joint committee, four representatives on either side shall form a quorum.

The monthly meeting of the general committee of the association was held on Thursday, January 14th, when the president, Mr. George Macfarlane, presided over a good attendance.

Accounts for the quarter were passed for payment, and three new members were elected into the association. The question of the reorganisation of the association was again down for consideration, and several reports were received. It was decided that the revised list of those members who had qualified under the new rules be issued without further delay, and that members be instructed to conform to the inter-trading rule.

Circulars were read from the National Federation with reference to the "Builders' Journal," and the secretary gave his report thereon, and it was agreed that everything possible was being done to further the scheme as far as this association was concerned. It was agreed that the association become subscribers to the journal, and the secretary was instructed to make application for the same.

Fines imposed by the plasterers' and painters' branch under their rules were confirmed.

A letter was read from the secretary of the National Federation with reference to the Manchester Corporation Bill to be laid before Parliament during the next session, and the secretary was instructed to obtain copies of the clauses relating to building operations for consideration at the next meeting.

The joiners' branch met at the board-room, Blackfriars Street, on Thursday, January 14th, to receive a deputation from the operatives' society to settle matters arising out of the decisions of the National and Northern Centre Conciliation Boards. The working hours for night shifts provided under the Northern Centre decision were adopted. The operatives requested that the word "federated" be deleted from the said rule, but it was pointed out that as the decision was based on the word, they could not see their way to consent to its being deleted. It was agreed to add a clause to the discharge rule, providing that 1s. shall be allowed over and above their wages for grinding, when such facilities were not provided, but that it be distinctly understood that the full notice shall be worked by the employee.

It was decided to call an early meeting to consider the present notice and counter notice with a view to arriving at some mutual arrangement, whereby the matter can be settled and the rules printed at an early date.

OLDHAM AND DISTRICT ASSOCIATION.

Secretaries: Cowper and Dean, Accountants.

The number of members of the Oldham and District Association is now 180.

Since the last published report, the operative joiners' society have asked for a meeting in connection with the employers' notice for reduction in wages of ½d. per hour. This meeting will be granted shortly. The executive committee have also met and approved of the accounts for the year for submission to the general meeting. It was resolved that a number of members who were in arrears with their subscriptions be given seven days' notice of expulsion from membership.

It was recommended to the annual general meeting that the entrance fee for new members be increased from 2s. 6d. to £2 2s. It was felt that this was necessary because, in the first place, the surplus funds were now in a healthy condition, being equal to about 50s. per member, and it was deemed unfair that new members should participate in these funds on an equal footing with old members; secondly, a number of members who had joined during the last two or three years seemed to have an idea that they could enter and leave the association when it suited their convenience under the intertrading rule. It was thought that an entrance fee of £2 2s. would act as a deterrent against this objectionable proceeding.

The question of the liability of contractors for defects in material, etc., specified by architects or proprietors, was brought forward by the president, and he pointed out that it had been ascertained that the state of the law was such that unless some formal communication was sent by the contractor to the architect or proprietor, in the first place, drawing attention to the defects likely to arise, the contractor could he held to have acquiesced in the suitability of the same, and would be held liable accordingly.

The twentieth annual general meeting was held at the Café Monico, Oldham, on Friday evening, January 29th. About forty members were present. The minutes of the last half-yearly general meeting were duly approved, and the president (Councillor Samuel Smethurst, J.P.), dealt with the annual report, which was duly approved. He pointed out the fact that the association would attain its majority next year, and this would in the ordinary course of events coincide with his election to the presidential chair of the National Federation. He said that some consideration would have to be given to the question of how the Official Journal could be placed in the hands of each member by increasing subscriptions or otherwise.

The question of the utility of the conciliation boards was raised by Mr. Rose, and discussed, and it was generally felt that they had been of considerable advantage in connection with trade disputes during 1908.

The poor response for subscriptions of 1s. towards the cost of the L.C. and N.W. Federation Year Book was discussed, and it was resolved that the amount be made up into £4 out of the local funds, as a fair proportion of the cost from Oldham. This was in addition to the amount paid for insertion of local operatives' rules and association rules in the Year Book. The local contributions to the Federation reserve funds were also discussed, and it was pointed out that at the commencement £300 minimum had been promised from Oldham, and £15 still was required to complete this amount, in addition to £6 16s. 6d. promised, but still outstanding. The list of subscribers was read, and resulted in further promises of £3 3s. The cash account and balance sheet were then submitted to the meeting and discussed.

The surplus funds have been considerably increased during the year, and the income is well above the expenditure, and appeared likely to continue so in future, although very considerable difficulty had been experienced by the secretaries in collecting subscriptions during the year, on account of bad trade, etc. The accounts were approved.

The officers and committeemen were elected for ensuing year; the only changes being as follows:—Councillor James Ogden, J.P., was elected vice-president; Mr. Edward Stephenson, jun., was elected to the executive committee in place of Mr. Ogden, who was now an ex-officio member; and Mr. W. Rose was elected to the executive committee in place of Mr. E. Whittaker, and also on the local trade committee.

It was decided that the Executive Committee should arrange the details for a picnic to Nottingham in June or July.

Mr. Councillor Ogden spoke at length on the cost of insurance against legal liability for accidents to workpeople, and the serious liability which had been placed upon builders by the Workmen's Compensation Act, 1906, not only in connection with direct workpeople, but in connection with sub-contractors' men. The expenses of the builder in this and other matters were increasing, and it behoved all members connected with the master builders' federations to endeavour to obtain better prices for the work undertaken, and not to accept contracts at prices which could not possibly be remunerative, as was the position in many instances at present. The president said that the difficulty lay in formulating a satisfactory and reasonably complete scheme, whereby better prices could be attained. At present it rested with each individual member to be determined to tender only under profitable conditions, and endeavour to be more loyal to each other in this connection.

ROSSENDALE AND DISTRICT ASSOCIATION.

Secreary: Robert Hall.

The fourth annual dinner in connection with the Rossendale and District Association was held at the Queen's Arms Hotel, Rawtenstall, on Wednesday evening, January 20th, forty representatives sitting down. In addition to the members of the association were Mr. George Macfarlane, of Manchester, past president of the National Federation of Building Trade Employers of Great Britain and Ireland, as well as representing the Lancashire and Cheshire Federation, who, in reply to the toast of the Federation, spoke on the necessity of combination, and hoped that the reports one heard that things were mending were true, and that not only would the amount of work increase and improve, but that it would bring better prices. Mr. J. E. Tinline, past president of the Bury and District Building Trade Employers' Association, proposed the toast of the Rossendale and District Master Builders' Association, coupling with it the name of the president, Mr. B. Constantine, of Haslingden. Mr. Tinline said he honestly believed that if members would only carry out the intertrading rule in the spirit in which it was intended to apply, they would, in a few years, gather into the association every employer in the building trade in the Rossendale Valley. Mr. Constantine, the president, responding, said that although the association had up to the present only partially adopted the intertrading rule, he felt that to be successful they would have to adopt the rule in its entirety. Other toasts followed, including that of the visitors, which was responded to by the surveyors of Bacup, Rawtenstall, and Haslingden.

ST. HELENS ASSOCIATION.

Secretary: Bertram B. Moss, F.C.R.A.

The St. Helens Association has had no meetings for a considerable time, as great dissatisfaction has been expressed by several members with the decision of the Northern Centre Conciliation Board increasing the joiners' wages, and a large number of resignations have come in from various members. Through the influence of the president of the Lancashire and Cheshire Federation, Mr. William Bullen, the employers in the town have been invited to a meeting, and several up to now have promised to attend the meeting when called, and it is hoped that several favourable replies will be received from others shortly.

WARRINGTON AND DISTRICT ASSOCIATION.

Secretary: Bertram B. Moss, F.C.R.A.

The annual general meeting of the Warrington and District Association was held at 57, Horsemarket Street, Warrington, on January 20th, when a large number of members attended. All the officers and committee were re-elected as follows:—President, Mr. Henry Collin; vice-president, Mr. C. W. Davenport; secretary, Mr. Bertram B. Moss, F.C.R.A., 24, Sir Thomas Street, Liverpool; committee, Mr. Henry Collin, Mr. C. W. Davenport, Mr. H. Fairclough, Mr. F. Warburton, Mr. F. Wright, Mr. John Dolan, and Mr. J. B. Johnson.

The annual report, which was unanimously adopted, summarises the work of the year, and records that no serious disputes with the operatives have occurred, nor has there been any alteration of wages or working hours.

It is stated that when the question of giving notice to the operatives for a reduction in wages was under discussion, the recent decisions of the conciliation boards were considered, and in view of the unsatisfactory procedure of these conciliation boards, it was decided that this association should give the Federation six months' notice to withdraw, and this notice expires on May 1st next. It is necessary to resign from the Federation to avoid coming under the jurisdiction of the conciliation boards, as it is held that no individual association can withdraw from the conciliation board whilst affiliated to the Federation, and this course has been adopted in order that this association will have a free hand when the notice for alteration of rules expires in May and June next.

Communications have been addressed to architects, and others, with reference to the conditions of contracts, etc., and with reference to estimates being invited without quantities being supplied, also in cases where priced quantities have been demanded with each tender. The representations made in these cases have in several instances resulted in the elimination of unfair conditions.

An appeal to members for subscriptions to Warrington Infirmary extension fund resulted in £30 14s. 6d. being subscribed by eight firms, and this amount was remitted to the treasurer of the fund. In addition to this, four other members had already subscribed over £120 direct to the fund.

WIGAN AND DISTRICT ASSOCIATION.

Secretary: R. Hollows, A.C.A., etc.

The first meeting of representatives of Wigan Association, with the operative joiners, in connection with the notice and counter-notice of alterations to working rules was held on Thursday, January 21st. The operatives chiefly demanded reduced hours in summer and winter months, irrespective of a rise in wages. This demand is made with the idea of employing more men than are at present employed. Other points dealt with in the notice and counter-notice were of a merely local nature. A further meeting in regard thereto will be held in the course of a week or so.

There is nothing to report from Altrincham, Ashton-under-Lyne, Birkenhead, Blackpool, Bolton, Burnley, Chester, Crewe, Darwen, Heywood, Lancaster, Leigh, Liverpool, Longridge, Macclesfield, Middleton, Preston, Radcliffe, Rochdale, Southport, St. Annes-on-Sea, Stockport, Wallasey.

THE YORKSHIRE FEDERATION.

Secretary; J. DAVIDSON, 14, Park Row, Leeds.

The annual report for the year ended November 30th, 1908, of the Yorkshire Federation of Building Trade Employers states that the interest in the monthly meetings has been fully sustained, and that the attendance of the representatives of the affiliated local associations has been maintained.

The influence of the Federation, it is reported, is steadily growing, and is manifested in some degree by the civic welcomes which have been again accorded the members during the year. It is felt that in this way the beneficent aims and objects of the Federation will be made more widely known, and their pacific intentions more fully appreciated. The Council have pleasure in recording the election of Councillor J. Birch, who has for many years been an active member of the York Association, as the Lord Mayor of York.

The continued experience of the conciliation boards has realised and justified the highest anticipations of their usefulness and practical utility. All matters which have arisen in Yorkshire have been mutually settled by the Local Conciliation Boards, whose proceedings have been conducted in an amicable and friendly spirit. A proposal has been made that the question of the establishment of a Local Conciliation Board should be left entirely to the discretion of each local association. After careful consideration, the Council were strongly of opinion that it would be inimical to the best interests of employers to make such a drastic change in a fundamental principle until more extended experience of the working under normal conditions was available. An application from the builders' labourers for admission into the privileges of the conciliation scheme has been carefully considered. It is recommended that any local association which has mutually adopted rules with the bricklayers' labourers for the governing of rates of wages and conditions of labour, should consider, in conjunction with the operatives who are parties to the local conciliation board, the expediency of admitting the labourers as members of such board. The Northern Centre Conciliation Board has been requested to consider any labourers' question that might be referred to them, on condition that the parties making the appeal should meet all expenses in connection therewith. During the year most Local Boards have agreed upon the area which the Conciliation Boards cover, and these almost invariably, as recommended by the Federation, follow the area in which the working rules apply.

The Council have viewed with deep regret the many claims made by the operatives in the Lancashire and Cheshire districts. Some of these were felt to be absolutely unwarranted, and not to be justified by the present condition of trade. Notwithstanding these requests, the Federation, after consulting with the local associations, passed a unanimous resolution that it was not opportune at the present time to give notice for a general reduction in wages so far as Yorkshire is concerned.

With a view to extending the policy of conciliation, the Council recommended local conciliation boards, in order that they may be made effective in the settlement of disputes, to consider any matter of trade interest outside their area or jurisdiction, on the written application of the parties concerned that the matter in dispute is submitted to the board as arbitrators.

Careful consideration was given to the proposals of the President of the Board of Trade for the establishment of a Court of Arbitration, and the compiling of official lists of panels of chairmen, employers and operatives, to hear and consider any trade dispute which might be referred to it. In view of the great interest which building trade employers have at stake, representations have been made to the Board of Trade to include on the panels the names of representative employers, not only of the National Federation, but also of the county federations.

Having regard to the fact that disputes or differences occasionally arise between members, and the desirability of maintaining cordial and friendly relations, the Federation have appointed an Arbitration Committee to consider any matter which may arise, and which it is mutually agreed shall be referred to the determination of the said committee.

The Federation have published a pamphlet showing the serious economic and trade disadvantages which accrue from municipal works departments, and the Council are glad to learn that it exercised some influence during the recent municipal elections. The character of the relief works undertaken for the unemployed, and the method in which they are carried out, demands most careful attention, otherwise they may prove a further menace to the trade, and could easily form the nucleus of a works department.

The National Federation is taking active steps to secure the recognition of the use of the National form of contract by architectural societies, Government departments, and local authorities. The Council have approached the West Riding County Council, and have recommended local associations to deal in the first instance with the local authorities in their area. A circular letter has been addressed to Yorkshire architects inviting their attention to the use of the National form of contract, and also requesting that contractors might have early intimation of the result of their tenders, that certificates, especially the final one, may be promptly issued, and that an item be inserted in quantities to cover workmen's compensation. The responses to the circular have been very gratifying.

One of the most important branches of work in connection with the Federation is that carried out by the Employers' Parliamentary Council. The activity of the Labour Party during the past two or three years makes it absolutely necessary that every Bill introduced into Parliament should be most carefully scrutinised, with a view to protecting and safeguarding the interests of members.

The Departmental Committee appointed by the Home Secretary to inquire into the accidents attendant on building operations have presented their report during the year. The Council made urgent representations to the Home Secretary on such matters as they considered were not satisfactory, and by which employers were likely to be seriously prejudiced. The Hon. Secretary has introduced into Parliament a Building Operations and Engineering Works Bill, which, it is gratifying to find, contains some of the suggestions made by building trade employers. Steps have been taken to combat any drastic amendments which may be moved either in committee or in Parliament.

The attention of the Council was drawn to the enormous work which would be involved if the detailed particulars enumerated in the Board of Trade returns were accurately compiled. The Council, having been assured that the Board of Trade would be satisfied with totals only, recommended members to adopt that method of filling up the returns.

The Council has given most careful consideration to the returns which have to be furnished to the Home Secretary under Section 12 of the Workmen's Compensation Act, 1906. The Home Office desires that the returns furnished should relate solely to compensation paid for accidents arising on permanent premises which come under the classification of factories. As these accidents form a very small proportion of the claims paid under the Workmen's Compensation Act, the Council impressed upon the Home Office the necessity of ensuring that the returns only included the risks asked for, as building trade employers might easily be seriously prejudiced by insurance companies furnishing statistics which included the whole of the claims paid for workmen's compensation.

The value of the collective insurance scheme of the Federation will be appreciated from the financial benefit which has accrued to the Federation, viz:—£[illegible] 9s. 4d. The experience up to the present has been an unqualified success. Every claim has been promptly paid, and all the permanent cases have been settled by a commuted payment.

The influence of the Federation has been actively given in the protection of several members during the year. This intervention has invariably been to the benefit of the member directly concerned, and should lead all members to appreciate the great power which the Federation can exercise when they take up a case on behalf of a member.

The National Federation has completed arrangements whereby "The Builders' Journal" becomes the official organ of the National Federation. This will be the sole medium of official communications from the National and county federations and local associations. The paper has already earned a splendid reputation among architects and builders, and members are most earnestly requested to become subscribers, in order that the National Federation may obtain the fullest diplomatic and financial advantages which a well supported official paper should undoubtedly bestow. Terms of subscription may be obtained from the local secretaries.

The Council regret that they have not been successful during the year in obtaining the affiliation of other Master Builders' Associations. The difficulties experienced arise mainly from the continued depression in trade and the consequent inactivity of the operatives. Negotiations are taking place which, it is hoped, will prove successful at an early date.

The Officers and Executive Council for 1909 are as follows:—President, Mr. W. R. Thompson; senior vice-president, Councillor W. G. England; junior vice-president, Mr. A. J. Forsdike; treasurer, Mr. W. T. Ledgard; secretary, Mr. J. Davidson, 14, Park Row, Leeds.

LOCAL ASSOCIATIONS AFFILIATED TO THE YORKSHIRE FEDERATION.

BARNSLEY ASSOCIATION.

Secretary: J. Denton.

The annual dinner of the Barnsley Federation of Building Trade Employers, in conjunction with the Barnsley Master Builders' Association, was held at the King's Head Hotel, on Friday, January 8th.

Mr. C. D. Potter (president of the Master Builders' Association) was in the chair, and was supported by Councillor G. Haigh (president of the Federation), the Mayor of Barnsley (Alderman E. J. Rideal), the Deputy Mayor (Councillor J. S. Rose), Councillor W. G. England, J.P. (senior vice-president of the Yorkshire Federation), Mr. H. Crawshaw, and Mr. E. W. Dyson (who represented the local architects), Mr. T. Bottomley (president of the Huddersfield Federation), Mr. S. Coop (president of the Dewsbury Federation), and Mr. T. Smith, secretary of the Sheffield Association. In all fifty-eight sat down to dinner.

Before the toast list was proceeded with, reference was made to the death of one of the members (Mr. H. Oxley). After the customary loyal toasts, Mr. T. Smith, of Sheffield, proposed the "Local Associations," and in the course of his remarks referred to the fact that every firm of note in Barnsley belonged to the Federation.

Councillor G. Haigh, in replying, said that, although trade had been depressed, they at Barnsley had taken a firm stand against any lowering of wages. The chairman also replied.

Mr. E. Broley, in proposing the "Mayor and Corporation," referred to the continued good feeling between the corporation and the building trades, and to the continued advancement in sanitary arrangements in the borough of Barnsley. The Mayor, in replying, remarked that, although their building by-laws were, perhaps, obsolete, yet if they made them in accordance with the Local Government Board's requirements they would be worse than ever. More breathing space was provided under the old by-laws than under the new.

Councillor J. S. Rose, the deputy mayor, remarked that Barnsley's rates were lower on the average than most towns of similar class. Councillor W. G. England, J.P., said that he shared the optimism that the building trade had now taken a turn for the better. Mr. J. Smith, in proposing "The Architects," referred to the National form of contract, which, he contended, ought to be universally accepted. Mr. E. W. Dyson responded.

The usual monthly meeting of the association, coming so soon after the dinner, was not very well attended, and no business of importance was transacted.

HALIFAX ASSOCIATION.

Secretary: A. E. Dalzell.

The usual monthly meeting of the Halifax Association was held on January 7th, at Exchange Chambers, Northgate, Halifax, Mr. Lewis Firth, president, in the chair.

The association delegate's report of the monthly and annual meetings of the Yorkshire Federation held at Wakefield, December 17th, last was presented, and the minutes of both meetings were read by Mr. Naylor.

Members were urged to support the "Builders' Journal" as the official organ of the Federation.

With reference to the Yorkshire Federation's recommendation that federated employers were to obtain a written statement from all workmen engaged that they were not subject to the disabilities named, viz., "industrial disease or physical infirmity," as a false statement in this respect would seriously prejudice their claim to compensation under the Workmen's Compensation Act, correspondence has taken place between the Yorkshire Federation and the association.

Members were urged to support the Federation insurance scheme.

A discussion arose as to the necessity for contractors to protect themselves against the liability for efficacy of work carried out by the direction of architects, but which builders, by their practical knowledge and training, realised would be inadequate or insufficient to fulfil the purpose intended. It was thought that protests should be set out in writing, the contractors definitely stating that they would not be responsible if the work carried out as originally intended and ordered, proved inadequate at any future time. In the course of the discussion, many cases were cited in which the contractor had been charged for such faulty designing.

The submitting by builders of plans for proposed alterations and additions was discussed, and it was resolved, on the motion of Mr. Raynor, seconded by Mr. Lewis Firth, that this association would assist the Halifax Architectural Society by refusing to carry out work designed by unqualified practitioners, and also the members would pledge themselves not to prepare plans of alterations or additions to buildings.

SELBY ASSOCIATION.

Secretary: Chas. Maw.

A meeting of the Selby Master Builders' Association was held at the George Hotel, Selby, on Friday evening, January 15th, the president (Mr. H. Connell) in the chair. The delegates gave a report of their visit to the Yorkshire Federation's monthly meeting at Wakefield. Representatives were also appointed to attend the Leeds meeting and dinner. An interesting discussion on several matters of trade importance followed.

SHEFFIELD ASSOCIATION.

Secretary: Thos. Smith.

The monthly meeting of Sheffield Master Builders' Association was held on January 14th. The president (Mr. T. Eshelby) presided, and the attendance of members was the largest for some considerable time, although several members who usually attend the meetings were unavoidably absent.

The treasurer's report showed the association to be still making steady progress, the subscriptions for the year being the largest on record.

Six new members were elected, which, with the 20 elected at last meeting, made a substantial addition to the membership roll.

The president, vice-president, and committee were nominated for the annual meeting, there being 15 nominations for the 12 vacancies on the committee.

A letter was read from the Builders' Merchants' Association, saying that that association had not yet had an opportunity of discussing the suggested terms of the Master Builders' Association, with respect to preferential trading.

The special committee appointed to consider the adoption of a day-work price-list had not yet concluded their investigation, but they had obtained particulars from several associations, and were of opinion that a price-list would be as great an advantage at Sheffield as at the other places where it was in operation.

The question of a uniform summer holiday week was again discussed, but nothing definite was absolutely fixed. While the August Bank Holiday week was not exactly an ideal time in all respects, yet it had to be taken into account that if the holiday were not fixed for this date, works would in any case be closed down for some days, and it was therefore only a question of an additional day or two.

Attention was called to an instance of alleged wasteful expenditure on the part of the City council in making a sewer 21ft. deep, for a purpose for which there appeared no justification beyond the additional expenditure of about £600, as it was not a case in which sewerage was intended to be provided for at a lower level. The matter was referred to the Vigilance Committee.

YORK ASSOCIATION.

Secretary: J. Hague.

The York Association has, on behalf of the electricians carrying on private trade in the city, again taken up the question of the proposed opening of show-room for sale and display of fittings by York Corporation Electricity Committee. The following letter was sent the town clerk:—January 4th, 1909. —Dear Sir,—This association views with considerable alarm and apprehension the renewed proposal to be introduced at to-night's council meeting, to open a showroom for the sale of electricity fittings in the city. The prospect is a very discouraging one, and the principle dangerous to all private enterprise. It is submitted that municipal authorities should never place themselves in competition with, or undertake work that will be detrimental to the private trader. Numbering, as we do, amongst our many members, the whole of the private electrical firms trading in the city, we take this opportunity of speaking out on this question and endeavouring to prevent a pernicious principle being introduced into the city. The municipal authorities should not, it is submitted, do more than supply current to the consumer. To undertake the sale and fixing of fittings (invariably at an inadequate and cut rate) is unfair to the private traders who are ratepayers, and can only result in their being compelled to close their establishments. Submitting this letter to your kind consideration, and trusting that you will bring the same before the council meeting.—Yours faithfully, J. Hague.—H. Craven, Esq., town clerk, York.

At the council meeting held the same night, Mr. Councillor Hopkins moved that the following paragraph of the minutes be referred back:—"It was decided to give the Electricity Committee the first refusal of the rental of the remaining portion of the premises in Spurringate for use as a showroom"—and remarked that the matter was referred to in the above letter. This meant a step in municipalisation, which, if once taken, they would not easily be able to retrace. They were going to form a precedent. He objected to the proposal on the ground that it was an unfair form of competition on the part of the corporation. By such competition they would close up the small traders who were engaged in this business. Councillor Lambert supported, because of the way in which the question had been brought before the council: It was only the thin end of the wedge. The council divided on the amendment, the figures being: for, 14; against, 22; mutual, 5. The amendment was declared to be lost.

There is nothing to report from Barnoldswick, Bradford, Bridlington, Dewsbury, Grimsby, Harrogate, Huddersfield, Hull, Leeds, Malton, Morley, Scarborough, Shipley, Wakefield.

THE MIDLAND CENTRE OF THE NATIONAL FEDERATION.

Secretary: F. W. Amphlet, 58, New Street, Birmingham.

The annual meeting of the Midland Centre was held at the Imperial Hotel, Birmingham, on Thursday, January 14th, the president (Mr. Wm. Wistance) in the chair.

The minutes of the last half-yearly meeting, held at Walsall, on 15th July last, were read and confirmed.

The officers for this year were appointed as follows:—President, Councillor H. Smith (West Bromwich); vice-presidents, Col. J. Barnsley and Mr. Albert S. Smith (Birmingham); auditors, Messrs. F. H. Fish (Nottingham), and J. H. Walker (Derby); treasurer, Mr. H. Willcock (Wolverhampton). Mr. Albert S. Smith explained that, very much to their regret, Alderman T. E. Lowe did not see his way to continue in office. Messrs. J. Wright and Albert S. Smith were re-nominated as the two representatives of the Centre on the Administrative Committee of the National Federation Col. J. Barnsley and Messrs. J. H. Walker, J. H. Kellett, A. Brazier, and H. Willcock, were re-appointed as the five representatives of this centre on the National Conciliation Board. The following gentlemen were appointed as the representatives on the Midland Centre Conciliation Board:—Messrs. W. Yates, W. Wistance, J. Stokes, F. H. Fish, H. Cave, Councillor H. Green, J. B. Whitehouse, A. W. Chamberlain, Councillor H. Smith and R. Weston. The following gentlemen were elected as the eight representatives of the National Council: The president, Col. J. Barnsley, Albert S. Smith, W. Wistance, F. G. Whittall, J. Wright, A. Chambers, and H. Willcock. The annual report stated that there had again been freedom from serious labour troubles during the year. The difficulties which had arisen had mostly been satisfactorily dealt with by the Conciliation Boards. The associations affiliated to the centre were the same as last year. County Alderman J. Bowen, who had served the Centre faithfully since he was appointed first president in 1898, had retired from business, but was retaining his association with the Federation by becoming a private member.

Four meetings of the Midland Centre Conciliation Board had been held. At the first meeting, in January, a dispute with the Wolverhampton bricklayers was settled. The second was the annual meeting in May, when the officers were elected. At the third meeting, a dispute with the bricklayers, carpenters, and labourers at Leicester was considered, but no definite decision was arrived at, this being the first case which the Board had been unable to settle. It was referred to the National Board, and decided in favour of the operatives. The fourth meeting was held to consider a dispute between a firm of Liverpool contractors engaged on a job in Birmingham, and the local bricklayers. It dealt with the rate of payment to night-gangs, and was decided in favour of the operatives.

General satisfaction had been expressed with the arrangement arrived at by the National Federation in regard to making "The Builders' Journal and Architectural Engineer" the official organ of the Federation. The Executive Council earnestly hoped that every member of the centre would become a subscriber.

During the year the Secretary had met and addressed the following associations:—Burton-on-Trent, Bromsgrove, Derby, and King's Norton and Northfield. The collective insurance scheme with the Law Car and General Insurance Corporation, Ltd. (for insurance against workmen's compensation risks), had again been well taken up by a number of associations. It was saitsfactory to record that not a single complaint had reached the Secretary in regard to the settlement of claims. During the year the following meetings had been held:—Executive Council, 6; Emergency Committee, 3; Finance Committee, 2; Collective Insurance, 1.

The accounts showed a balance in hand of £40 0s. 10d. It was estimated that when the unpaid subscriptions were remitted there would be a credit balance of £62 12s., in addition to the sum of £55 13s. contributed to the Midland Centre reserve fund. The cash in hand on account of the National reserve fund was £51 4s. 3d., of which £25 was due to the National Federation. The report was approved and adopted.

The revised set of rules for the Centre was approved, and it was decided that 1,000 copies of same should be printed and a sufficient number sent to each local association, so that each member may receive a copy. It was also decided to hold another Conference of Midland Centre Secretaries in the spring. The secretary was instructed to send a report of the annual meeting to the "Builders' Journal," and it was understood that this should serve as a notification to the members of the business transacted.

The Secretary stated that, since drawing up the annual report, he had received a letter from Mr. B. R. Peploe, giving fuller particulars of the collective insurance scheme. The letter was read to the meeting.

The officers and the Birmingham representatives of the Executive Council were re-elected as the Emergency Committee. The Birmingham representatives on the Executive Council, together with the president, were appointed as the Finance Committee. The members of the Emergency Committee, together with Messrs. J. Wright, H. Cave, A. Chambers, F. W. Harris, A. W. Chamberlain, and R. P. Gathercole, were reappointed as the Collective Insurance Committee. The president, and Messrs. Albert S. Smith and J. B. Whitehouse, were appointed as the Organisation Committee.

The following resolution was passed:—"It having been reported to this meeting that an architect to a certain County Education Committee declines to accept tenders from builders for work to be carried out under him unless priced quantities are sent in with the tender, it is resolved that the National Administrative Committee be requested to take such steps as they may deem desirable to prevent the growth of this practice."

The notice given by the Northern Centre with reference to proposed alterations to the National Conciliation Board rules was considered. The general feeling of the meeting was against the proposed alterations. Mr. W. Yates called attention to what he considered a growing abuse, viz., the employment of a large number of operators by private firms, who were not strictly speaking in the building trade. It was generally agreed that it would be a difficult matter to deal with.

THE SOUTH-EASTERN CENTRE OF THE NATIONAL FEDERATION.

COMPOSED OF

The London Federation, The Southern Counties Federation, and The Eastern Counties Federation.

Secretary: T. COSTIGAN, 31 & 32, Bedford Street, Strand, London, W.C.

THE LONDON FEDERATION.

Secretary: T. COSTIGAN, 31 & 32, Bedford Street, Strand, London, W.C.

A council meeting of the London Master Builders' Association was held at 31 and 32, Bedford Street, Strand, W.C., on January 21st, when the following business was transacted:—(1) Correspondence with the Board of Trade re Operative Stonemasons' Society, and request for submitting the question of piecework to arbitration. (2) Correspondence re Colchester Lunatic Asylum. (3) Proceedings adopted with regard to the L.C.C. (General Powers) Bill, 1909. (4) Election of Mr. J. W. Jerram, of East Ham, as member of this association.

THE EASTERN COUNTIES FEDERATION.

LOCAL ASSOCIATIONS AFFILIATED TO THE EASTERN COUNTIES FEDERATION

GREAT YARMOUTH ASSOCIATION.

Secretary: R. J. Hill.

The number of members to date of the Great Yarmouth Association is forty-seven. The Secretary regrets to report that only four members responded to the circular convening a monthly meeting for January 5th, and that therefore no business was transacted. Members are reminded that the association's meetings are held on the first Tuesday in each month.

ASSOCIATIONS IN IRELAND.

MONTHLY REPORT.

BELFAST ASSOCIATION.

Secretary: J. McAulay, Solicitor.

The annual general meeting of the Belfast Association was held on January 26th, at the offices, 12, Mayfair, Arthur Square, Belfast, the president, Mr. John Martin, J.P., presiding. Before entering on the business of the meeting, the president stated that the death had occurred, on the previous Sunday, of one of their valued colleagues, Mr. W. J. Campbell. Mr. Robert B. Henry, J.P. (vice-president) and Mr. W. H. McLaughlin, J.P., also made references to the deceased member, and the secretary was instructed to convey to his son, Mr. J. O. Campbell, an expression of the members' sympathy.

The annual report, which was unanimously adopted, included the following references:—

The committee are not without hope that a substantial increase of business will shortly be experienced throughout the country. Already there is much encouragement in the trend of public affairs, and, judging from the improvement and activity that have already animated our principal local industries, the outlook, fortunately, is not only gratifying, but decidedly hopeful, at home.

The price of materials has considerably fallen during the year, but the cost of labour has undergone no change.

Considerable correspondence has passed, and much information has been obtained, during the year in respect to the National Federation of Building Trade Employers, and it is interesting and important to know that in connection with the Federation monthly reports, from a large number of builders' associations in Great Britain, are published in the "Builders' Journal," an excellent medium, which may be reliably commended to the support of members.

The friendly relationship subsisting between the Ulster Society of Architects and this association, the committee are pleased to say remains unaltered. With regard to contracts, however, no official form has yet been arranged.

With reference to open competitions for contracts, it is remarked that "a more conscientious sense of equity should prevail." A recognised standard rate of wages should be an element in every tender. Builders should support one another more than they do; they should also recollect that the prices obtained for contracts during the past year are not only below, but are inconsistent with, the value and importance of the work, and must only entail a loss.

The election of office-bearers resulted as follows:—President, Mr. John Martin, J.P.; vice-president and hon. treasurer, Mr. Robert B. Henry, J.P.; committee, Messrs. J. O. Campbell, J. Courtney, H. Keith, J. Lees, W. H. McLaughlin, J.P., J. Miskimmon, John Smith, and W. J. Stewart; Ulster representative on Council of National Federation of Builders, Mr. Robert B. Henry, J.P.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in contract, which requires them to pay the rates of wages current in the district.

Obituary.

The death has taken place at his residence, Richmond House, Boughton, Chester, of Mr. Edward Augustus Lyle Ould, F.R.I.B.A., of the firm of Messrs. Gravson and Ould, architects, of James Street, Liverpool. Mr. Hastwell Grayson has kindly supplied the following notes of the deceased architect's career:—Mr. Ould was born in 1852, at Tattenhall Rectory. After serving his articles in York, he spent some years in the office of Mr. John Douglas, of Chester. Rather more than twenty years ago he became a partner in the firm of Grayson and Ould. He was early regarded as an authority on half-timber work, which he studied both in England and in north-western France. He considered that it was especially necessary to follow precedent, both in the design and construction of timber work, and he strove with considerable success to get the same feeling that animated the buildings of the sixteenth and seventeenth centuries. A few years ago Mr. Batsford induced him to write a short book on examples of black and white work in Cheshire and Shropshire. Wightwick Manor, near Wolverhampton; Bidston Court, Thornton House, and Bank House, Tattenhall; in Cheshire; Bryn Estyn, near Wrexham; and Bryn Howell, near Llangollen; were his chief timbered houses. Numerous cottages and lodges, a branch bank at Crosby, and parish hall at Bromborough, were in the same style. The restoration of Hall-i'-the-Wood was intrusted to him. With his partners he was responsible for two churches at Liscard, Woolton parish church, and St. Barnabas, Rock Ferry. His larger houses include St. Helen's, Co. Dublin; Caer Hun, near Conway; The Hill, Hampstead, with a splendid picture gallery; Gatehouse, in Eskdale; Puddington Hall, in Cheshire; The Woodlands, near Southampton; and The Mount, near Wolverhampton; to the last has been recently added a large ballroom panelled in unpolished walnut. In Cambridge he built a block of rooms, and the Combination Room at Trinity Hall, also the Clergy Training College, and the recent additions to Selwyn College. About 300 cottages at Port Sunlight, and the schools, hospital, auditorium, and hotel there, as well as Messrs. Lever Bros.' premises in Dublin, were his work. Secondary schools were built by Messrs. Grayson and Ould at Harwarden, Chester, Liverpool, Carlisle, Whitehaven and Brampton, and there is one at Bootle in course of erection. As a young man, Mr. Ould gave a good deal of time to Volunteering, rowing, and amateur theatricals; in the last he greatly excelled. In appearance, in his manner of speaking, and in many little ways, he showed his Irish blood—the very twinkle in his eye attracted strangers and gained their confidence. He generally became the personal friend of clients and those who worked with him. Mr. Ould resided in Chester, where he was a member of the Beagles and the Chester Golf Club. He was President of the Liverpool Architectural Society a few years ago.

NEW MUNICIPAL WORKS.

The Local Government Board has decided to hold, or has recently held, as the respective dates indicate, inquiries into proposed expenditure by public bodies as follows:—Water supply works and plant:—Axbridge R.D.C., £700 for Blagdon (February 11); Saint Colomb Major R.D.C., £1,000 for Padstow Rural (February 9th); Pewsey R.D.C., £3,337 (February 12); Wells R.D.C., £4,000 for West Pennard (February 10); Scarborough B.C., £300 (February 11). ARCHITECT'S, Surveyor's or Builder's Assistant (23), Inter.R.I.B.A., good draughtsman, levelling, surveying, specifications, assist quantities, supervision, estate work, correspondence, accounts; excellent references; moderate salary.—H. O'R., 80, Lavender Sweep, Clapham, S.W. 4810

ARCHITECT'S Assistant, thoroughly experienced, temporary employment; domestic work, business premises, schools, etc.; surveying and levelling, etc.; two years' experience in Structural Engineer's office; salary moderate. — Box 4820, Builders' Journal Office.

ARCHITECT'S Junior Assistant disengaged, 4½ years' articles, wishes to meet with architect in Lancashire office; specimen drawings, certificates for construction; sitting for Inter. R.I.B.A., June.—Apply, J. S. H., Wittington Lane, New Springs, Wigan. 4815

ARCHITECT, estate agent, or builder's assistant, experienced in all branches; good references.—R. S., Eagle House, Marine Parade, Clacton-on-Sea. 4816

ARCHITECTS, and builders, experienced surveyor open to prepare quantities and estimates, check accounts and measuring; moderate terms.—Apply Box 4817, Builders' Journal Office.

ASSISTANT (27), good rapid draughtsman, competent all branches, will accept small salary for re-engagement in or near London.—Ernest Frost, "Dunsmore," Horeham Road, Sussex. 4824

ASSISTANT A.R.I.B.A. (29), 14 years' London and Provincial experience; working drawings, details, specifications, supervision, perspectives, assist quantities, well up in management; testimonials; references; salary, 2 guineas.—Apply A, 31, Cotswold Road, Westcliff-on-Sea, Essex. 4775

BUILDERS' Assistant desires situation; thorough knowledge plans, specifications, quantities, measuring; not afraid of work; salary not so much an object as permanent situation; 21; 5 years' experience.—Box 4839, Builders' Journal Office.

BUILDER'S general foreman, advertiser seeks engagement; 16 years' service as above with first-class London firm on important and various works; good references.—Address H., 150, Effra Road, Wimbledon, S.W. 4703

BUILDER'S or architect's assistant, 25, desires re-engagement, drawing, typewriting, shorthand, correspondence, accounts, and general office routine; also assist in quantities; excellent references, moderate salary.—Apply Box 4756, Builders' Journal Office.

BUILDERS' Assistant desires work; plans, estimates, setting out buildings, measuring up, prime costing, surveying, and levelling plots, ordering exact quantities, materials; 11 years' experience.—Box 4803, Builders' Journal Office.

BUILDER'S or Architect's Junior Assistant (18), good tracer, well up in prime cost, and general office work; excellent references; three years' experience. — J. W., 164, Wellesley Road, Ilford, Essex. 4833

CARPENTER, or Handy Man, tall; age 34; take charge on large jobs, wants work; 7 years' good reference; moderate salary.—H.C., Box 4838, Builders' Journal Office.

CLERK of Works seeks re-engagement; just finishing public building; varied experience, notably ferro-concrete construction; well recommended; testimonials most excellent; age 45.—A. B., Box 4814, Builders' Journal Office

CONTRACTOR'S outdoor manager and surveyor desires engagement; present situation 17 years; age 37; keen on variations; expert in measurements; all trades, quantities, estimating; town or country.—W., 2, Dalberg Road, Brixton. 4776

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, Builders' Journal Office.

ENGINEER, general, **wants permanent appointment, official or private staff; thorough all-round experience; electrical, plumbing, smith, married, 34; good testimonials.—86, Bathurst Gardens, Willesden. 4704**

ESTATE Owners.—Bricklayer, all-round, stone-waller, and general repairs; abstainer; good references; moderate wage for permanency.—Quinton, 12, Holland Road, Aston, Birmingham. 4802

FIREPROOF Engineers and Concrete Specialists. Advertiser, connected with above trades for 10 years, and whose name is well known in connection with same, desires position as manager, traveller, or head clerk; first-class book-keeper; aged 33; very moderate salary.—P. W. Potter, 73, Penshurst Road, Thornton Heath. 4719

FIRST Class Architectural Designer and Draughtsman, artistic and practical, experienced in planning; elevations and details, office and competition work; moderate salary.—Apply Box 4792, Builders' Journal Office.

FOREMAN Painter (working) seeks re-engagement); experienced in all class work in building trade, as for general alterations, etc.; good supervisor, and reliable; either town or country; abstainer.—X. Y. Z., 8, Barton Street, Westminster. 4807

GENERAL Foreman seeks re-engagement, thoroughly practical in all branches; trade, carpenter and joiner, good draughtsman, first class references; town or country.—A. J., 196, Murchison Road, Leyton. 4804

GENERAL Foreman seeks re-engagement; alterations or new, practical experience in all branches; carpenter and joiner; good references; age 36; moderate wages.—Caplen, 3, Victoria Mansion, Edgware Road, Paddington, W. 4779

GENERAL Foreman seeks re-engagement, thoroughly practical and reliable; new or alterations; carpenter and joiner; life abstainer; first-class references.—Foreman, 3, Hawbridge Road, Leytonstone. 4787

HEATING.—Schemes, quantities and prices, tracing, workmen's sheets and costs; shorthand-typist (speeds 90/40); 5 years in Midlands; good refs.; disengaged.—Box 4834, Builders' Journal Office.

JUNIOR Assistant desires situation, home or abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate salary.—Box 4613, Builders' Journal Office.

PLUMBING, etc., Sanitary or Lead-laying, job wanted, day or piecework; anywhere; lowest prices; best work; excellent references; used to speculating or jobbing.—Squirrell, 47a, Woodland Street, Dalston, N.E. 4749

QUANTITY Surveyor's Assistant (21), **4 years' experience, desires engagement, certificates and good references. — Apply Box 4745, Builders' Journal Office.**

QUANTITY Surveyor's Assistant, temporary assistance rendered in taking-off, measuring variations, land surveys, dilapidations, etc., by experienced surveyor; references. — Box 4808, Builders' Journal Office.

REINFORCED concrete foreman, disengaged, long and varied experience, especially in Kahn bars and expanded metal, timbering a speciality; carpenter by trade; good refs.—G. C., 59, University Road, Tooting, London. **4721**

R.I.B.A. Final Exam., 7 years' experience, 1½ in Paris; good all-round man requires berth at home or abroad; good refs.; salary moderate.—Box 4799, Builders' Journal Office.

SURVEYOR'S, Architect's Assistant (27), good varied architectural, municipal and engineering experience; contract drawings, details, assist quantities, surveys, levels, etc., houses, schools, works, sewage works, roads, etc. Salary £2 5s.—Box 4811, Builders' Journal Office.

SHOP-FITTING, advertiser (38), well up in all branches of air-tight work, seeks situation as foreman in shop-fitting or joinery works; 9 successive years' with present employer.—Apply, Box 4837, Builders' Journal Office.

SUN copies, tracings, and plans prepared.—Geo. Tune, Trevor, Llangollen, N. Wales. 4831

SHOP or general foreman, good draughtsman, good all-round experience, including reinforced concrete work; or as estate manager, preparing plans for same, etc.; country preferred. — "St. Osyth," Goldsworth Road, Woking, Surrey. 4829

TO Estate Owners, builder, experience, in all trades, desires position as manager (working or otherwise); plans prepared, quantities, setting out, accounts and supervision; abstainer; country preferred.—Box 4806, Builders' Journal Office.

VOLONTAIRE.—Foreign gentleman (21) desires position in builder's office, with opportunity of learning.—B. B., 43, Bolingbroke Grove, Wandsworth Common, S.W. 4789

Appointments Vacant.

ARTICLED Pupil, vacancy for same in an old-established architect's and quantity surveyor's office, on the South coast; trained under principals; moderate premium; part returned. A typewriter will receive greater consideration.—Apply Box 4822, Builders' Journal Office.

BUILDERS' Junior Assistant wanted, accustomed to tracing and general office routine.—Apply, T. S. Foster, Builder, Abergavenny, Mon. 4840

REPRESENTATIVE Wanted by City Firm of Heating Engineers; must have connection amongst architects and practical knowledge of the business. Permanent situation with good salary to fully qualified man; state age and experience, with all particulars, to Box 4821, Builders' Journal Office.

WANTED, Traveller, to offer article in great demand for schools, hospitals, dwellings, specified by all eminent architects throughout the United Kingdom; commission. — "Sanatorium Iron Air Brick Co.," 58, Denmark Road, Southport. 4818

WANTED immediately, Architectural Assistant in public office in North, for 6 months, where a variety of work is being carried out, to prepare sketch plans from instructions, working and detail drawings, specifications, etc., with thorough knowledge of quantities; he must be a quick and good constructional draughtsman; salary, £2 5s. per week.—Apply, with copies of 3 recent testimonials, to Box 4836, Builders' Journal Office.

The R.I.B.A. President at Home. A very enjoyable evening was spent at 9, Conduit Street, on Monday, February 8th, by the guests of the President of the Royal Institute of British Architects, when the works of the Travelling Students for the year 1907—1908 were exhibited, and attracted a considerable amount of attention from the large and representative gathering of the profession present on the occasion. Mr. George Drysdale (Soane medallist and Tite prizeman, 1908) exhibited many good works of a varied and interesting character, comprising pencil sketches from (1) Venice (including drawings of the church of S. Maria della Salute and the Doge's Palace), (2) Florence (a bay of the Pitti Palace), and (3) Rome (the Farnese Palace, Santa Maria Maggiore, and the Cloister of S. John Lateran). Mr. Drysdale's coloured sketch elevations of a holy-water stoup from Siena Cathedral were as much admired for their admirable rendering of detail as was his large drawing of the Loggia dei Lanzi for its well-executed groups of sculpture. The Pora Pilo, Genoa, was represented by a sketch, in elevation, exhibiting a delightful vista as seen through the central archway. Other drawings and sketches included some studies of iron gates from Siena Cathedral. The works of Mr. Arthur R. H. Jackson (the Owen Jones student of 1907), which show commendable restraint in the colouring, comprised a large number of subjects from Venice, among which we may mention an interior view of S. Mark's and some well-drawn details of mosaics from various portions of that building. The Paolo Veronese ceilings of the Doge's palace, in which the figure subjects are extremely well delineated, were much admired. Mr. Jackson's contributions also included a detail drawing of the Scarlatti Chamber; a sketch of the Cloisters, Monreale, Sicily; a fountain near Santa Sophia, Constantinople; an interior of the Mosque of the Sultan Ahmed; and a scheme for the colour decoration of the vaulting of S. Mildred's, Bread Street, E.C. Mr. G. Salway Nicol (Tite prizeman, 1907) exhibited a series of able pencil sketches (perspectives), of which the rendering, albeit strongly reminiscent of Mr. J. B. Fulton's style, is to be highly commended. The subjects of his work cover a large field of study, and include doorways from Genoa, an interior perspective from Pisa, a sketch of the Capitol at Rome, the tomb of Lorenzo de Medici, the Pantheon, the Trevi fountain, and the Church of San Pietro, at Rome, and exterior and interior views of the Church of S. Maria della Salute, Venice, and a sketch of the staircase from the Palazza Regia Universita, Genoa. Mr. Harold Cooper (Soane medallist, 1907) showed some beautiful works in colour, including a large perspective of the West front of Orveito Cathedral and a finely rendered drawing of the Porta della Carta from the Ducal Palace, Venice; but we thought his sketch of the interior of the Council Chamber of the Castello S. Angelo, Rome, was rather crude in treatment. Mr. Cooper's studies in decorative work include the well-known friezes from the Papal apartments of the Castello S. Angelo, at Rome, and examples of Pompeian decorations and drawings of the beautiful lantern from the Church of S. Maria de Loreto, Rome. A series of delightful water-colour drawings served to enhance the attraction of Mr. Cooper's exhibition. Mr. S. G. Follett (Pugin Student, 1908) has made a special study of open-timber roofs, and among the admirable sketches he exhibited were some measured drawings of Broughton Castle, Oxfordshire, the old (14th century) barn at Bradford-on-Avon, the Manor House, Woodlands (near Mere), Wiltshire, Martock Manor House, Somerset, and the Monastery House, Shutlanger, Northants. Other subjects included the open roofs of the halls of the Chantry Farm, Stoke-under-Hamdon, Somerset, of the old Vicarage at Muchelney, and the curious octagonal timber roof over the kitchen of the Manor House, Stanton Harcourt, Oxfordshire. The fine linen panelling to be found in the seating of the Abbott's room at Muchelney Abbey, Somerset, was represented in a sheet of beautifully drawn full-size details. Mr. Follett is to be congratulated upon the sympathetic and delicate rendering of his pen-and-ink sketches.

A Council of Fine Arts. We are pleased to learn, from the "New York Times" of January 21st, that President Roosevelt, following a suggestion made by the American Institute of Architects of Washington, has created a Council of Fine Arts, and directed that, for the future, "before any plans are formulated for public buildings or grounds, or for the location or erection of any statue," the heads of executive departments, bureaus, and commissions must submit the matter to the Fine Arts Council, and follow their advice, "unless for good and sufficient reasons the President directs otherwise." The supervising architect of the Treasury is to act as executive officer for carrying out the recommendations of the Council, which is constituted as follows: — Architects: Cass Gilbert, C. Grant La Farge, Walter Cook, William A. Boring, S. B. P. Trowbridge, John G. Howard, Glenn Brown, Thomas R. Kimball, John H. M. Donaldson, George B. Post, John L. Mauran, D. H. Burnham, Arnold W. Brunner, Robert S. Peabody, Charles F. McKim, William S. Kemes, James Rush Marshall, Abram Garfield, Frank Miles Day, William B. Mundie, and C. Howard Walker, Painters: John La Farge, F. D. Millet, E. H. Blashford, and Kenyon Cox. Sculptors: Daniel C. French, Herbert Adams, H. A. MacNiel, and K. I. Bitter. Landscape Architect: Frederic Law Olmsted, jun. Although all lovers of art must approve the action of the President, we are scarcely surprised to hear that Congress was indignant at the order, which it regarded as a further encroachment on its rights and privileges, and it was pointed out that Congress, in appropriating money for public buildings, had hitherto usually specified, in a general way, what these buildings should be, and in many instances had named commissions to report on the plans. For instance, when Congress last year appropriated 2,500,000 dollars for a site for the Departments of State, Justice, and Commerce and Labour, the Secretaries of the three departments most interested were named (in addition to the Secretary of the Treasury and the Superintendent of the Capitol), as a Commission to advise Congress as to the best plans for buildings. Whilst we, somewhat sadly, wonder why practical questions affecting the welfare of the community which abroad can be thus met and successfully solved appear destined to remain unsolved in England for many years to come, we can only suppose, having regard to the fact that the standard of architectural education in America is far higher than in this country, that the President's action is merely the logical outcome of an intelligent appreciation of the architect's art which seems to permeate all nations but our own.

Cutting Prices. Mr. A. G. White, the Secretary of the National Federation of Building Trades Employers, speaking at the dinner of the Leicester Association of Master Builders, dealt tentatively and cautiously with the thorny subject of "undercutting." We are not sure that the National Secretary used that term, or whether he would approve of its application to the circumstances upon which he based his observations; the word is here adopted as expressing with convenient brevity the practice that is prevalent among builders, as well as amongst most other traders, of underbidding each other to such a degree that the "deal" becomes unremunerative or worse. This vice was never more prevalent than it is at the present time. Work being so scarce, the competition for it is proportionately keen, and it is not surprising to hear that in many instances the figuring is so close as to leave absolutely no margin for profit, and, indeed, to render highly probable an actual loss. It is said that just now the substantial builder is the chief offender. He wants to keep together his efficient staff, to maintain his effective organisation, to preserve his plant and machinery from deterioration which is worse than wear and tear, and to keep up appearances in offices, workshops, and yards, where the "abomination of desolation" would be but a poor advertisement for the firm; and so he reduces his tenders to the lowest limit. He can afford to "mark time" until the forward movement is resumed; but the comparatively small man, who must earn a profit in order to meet his expenses, suffers acutely from this unfair competition, which, moreover, must have a tendency to lower the tone of the whole market. But unfair competition is not peculiar to this time or to this trade. It is a chronic and perhaps an incurable canker of commerce and industry. Though a radical cure may be in the nature of things impossible, however, doubtless a good deal can be done to mitigate the mischief and to prevent it from spreading. Mr. White, handling the subject in a broad and philosophic manner, suggested certain directions in which remedies might be sought. The builder should enjoy greater facilities for ascertaining the state of the market in which, at present, for want of more accurate information, he operates more or less blindly and at random. Competitive tendering is bad enough, and is likely to endure, but ignorant tendering is worse, and is apparently amenable to treatment. It may perhaps be possible to gather and distribute such information concerning the current condition of the market as may render unnecessary the haphazard tendering of which so much is seen; but any such movement would have to be organised with great delicacy and skill, in order to avoid the stigma that, justly or unjustly, attaches to trusts and rings. The federated builders would no doubt endeavour to evolve a scheme whose fairness to all parties could never be called in question. Possibly such a scheme may never be materialised. But the Federation could be made the means of attempting it. What is perhaps even more important than definite action in the matter, is the tone that must inevitably result from the mere existence of the Federation—its benefits are moral as well as material. It creates an atmosphere in which the price-cutter is braced up to a higher sense of self-respect and an increased regard for his duty towards his neighbours.

A "Jolligists'" Jubilee.

"Let us go jolligising!" Charles Kingsley was wont to exclaim to his friends and pupils. The Geologists' Association, which, having been founded in 1858, has just attained and celebrated its jubilee, seems to lay some stress on this breezy view of the science, for Mr. W. Watts, presiding the other night at the annual meeting of the Association, declared that field excursions had been the chief end and aim of its existence. "They were its most useful form of activity, the index of its success, the occupation of its chief members, and its most important educational function." It would not be surprising to learn that among the 661 members that this peripatetic association can now boast, there are many architects. It must be at once instructive, healthful, and altogether delightful, to track, in congenial company, the Portland screw to its lonely lair, and to discover the sea-lily in situ, the limestone in its natural bed. The architect who prefers to remain prone in his own natural bed rather than to sally forth with kindred spirits while yet the dew is glistening on the short and scanty grass of the rolling downs will probably find that the museum in Jermyn Street will but increase his somnolence. The architect ought to know a little of everything, and more than a little of some things, among which it seems legitimate to include a knowledge of the rocks whence, in one form or another (even brick earth being, geologically speaking, a "rock"), his buildings are hewn; and when the acquirement of such useful information is compatible with invigorating excursions afield, nothing further need be said in commendation of the "jolligising" methods of this fifty-year-old Association.

The L.G.B. Report.

The average Government report is studiously cynical. A drily sarcastic tone, and a frigidly severe, not to say mean and narrow, estimate of human motives, form the staple of the style in which such documents are usually drafted. The thirty-seventh annual report of the Local Government Board (for 1907-8) which was issued last week, is fairly true to type. One section of the report comments on "the difficulty of curbing the extravagance of boards of guardians in their building operations," as if that extravagance, which has been brought into perhaps undue prominence by one or two notorious cases, were not amply set off by innumerable instances of well nigh incredible parsimony and penny-wise economy. "An architect," we are coolly informed, "is paid by commission, and there is, therefore, every inducement to him to make his plans as elaborate as possible." This need not be regarded as a covert insult to the profession! It does not condemn the architect. It simply insinuates that the foolish guardians tempt him, and that, being human, he is likely to make the most of the opportunities thus thrown in his way. Some men might. Others—and we would fain hope the vast majority—certainly would not barter their honour and self-respect for any glittering temptation that any board of guardians could hold out to them. That boards of guardians or other local authorities are in this respect inveterate sinners is suggested by the statement that "it seems that after the Local Government Board have sanctioned a certain loan in respect of particular plans, it has been the custom to make all sorts of additions without any further authorisation, and in this way huge bills have been run up to the profit of the architect and the contractors." Is it not within the power of the Board to surcharge or "cockertonise" such excesses of naughtiness? Or, alternatively, is it not the fact that in most cases of this sort the extras have been found to be perfectly necessary and legitimate, so that the L.G.B. could not reasonably interfere? The fact is that the average architect is not the coldly calculating person that the L.G.B. would have us suppose him to be. He cannot estimate to a nicety either his own chances of personal emolument or the probable cost of a building which, as it grows under his hands, develops needs that could not possibly have been foreseen except by simply superhuman prescience. That builders "lose a little on the contract in order to gain a lot on the extras" is a vulgar error, to which the Local Government Board should not have subscribed even by obscure innuendo; and to insinuate that, as a body, architects are not above inflating the cost of a public building in order to swell their commission, is grossly to malign a profession that, on the whole, notoriously pays too little attention to the business side of the argument; and it is to credit them with a degree of influence and a power of persuasion that would suffice to move mountains. But if the Local Government Board could invent and establish some equitable basis of remuneration that would render the architect immune from sinister attacks in its own Blue Books, it might possibly be in a position to save a few extras on the printing bill. And while it is in the reforming mood, it might enquire what proportion of the money allotted to municipal building is absorbed in obtaining Parliamentary powers and meeting Local Government Board requirements, wise and otherwise.

Pulex Irritans.

After all, it would seem that there is some semblance of finality of liability under the Workmen's Compensation Act. The law draws the line at fleabites. At Cardiff, a carpenter sued his employers for compensation "in respect of a bite of a flea." The "accident" was thus reported to the employers:—"Independent Order of Rechabites.—I am sorry to inform you I am unable to follow my work to-day. The fleabite I received last week, and showed you on Friday, has resulted in the poisoning of my leg." It was suggested that the ferocious flea was allowed to be at large at a place in Cardiff where the carpenter was putting in a shop front; and being carelessly left unchained and unmuzzled, it flew at the unfortunate carpenter, probably without so much as a premonitory growl, and fastened its horrid fangs in his leg, inflicting on him a wound that one of the witnesses described as being "more like the bite of a bulldog." This finely developed flea must have been reared on Mr. H. G. Wells's "Food of the Gods," on which nourishment field-mice grew to the dimensions of kangaroos; or it must have been big enough to justify the description of the deathless distich "These fleas have other fleas to bite 'em. And so along, *ad infinitum*." The great question that the Court had to determine was the ownership of this colossal *pulex*. Upon this point the evidence was so unsatisfactory—the flea evidently not having worn a collar bearing its owner's name and address—that the judge had no alternative but to find for the respondents. Whether the flea is still running loose, or whether it has been shot in its tracks, is not reported. The decision is no doubt important to the trade, for, if the finding had been otherwise, the risks, especially in certain branches of the trade, must become absolutely paralysing. It is credibly reported, for instance, that "on, in, or about the premises" of the simple poor, this kind of vicious pet, in several varieties, and in assorted sizes, doth greatly abound, and the employer called upon to pay contingent damages every time they bite would need a pretty substantial reserve fund, for he would find it very difficult to persuade any insurance corporation to take over the appalling risk of such ferocious fleas as those that flourish Cardiff way.

PLANNING OF SECONDARY SCHOOLS.*

By H. T. Buckland.

In two blocks slightly better lighting and probably better disposition of playgrounds are possible, and one central hall may be side-lighted. In three blocks the same remarks apply, and side-lighted central halls become possible in all departments, and a natural system of ventilation is facilitated.

Secondary Schools.

Government aid for secondary education has only been available since the passing of the Act of 1902; until that time the higher grade school was the only continuation of State-aided general education, and the buildings provided for this higher-grade education were modelled upon those for elementary education; it is, therefore, not surprising to find that the earlier secondary schools erected after the passing of the Act of 1902 bear all the marked characteristics of the elementary school in their planning.

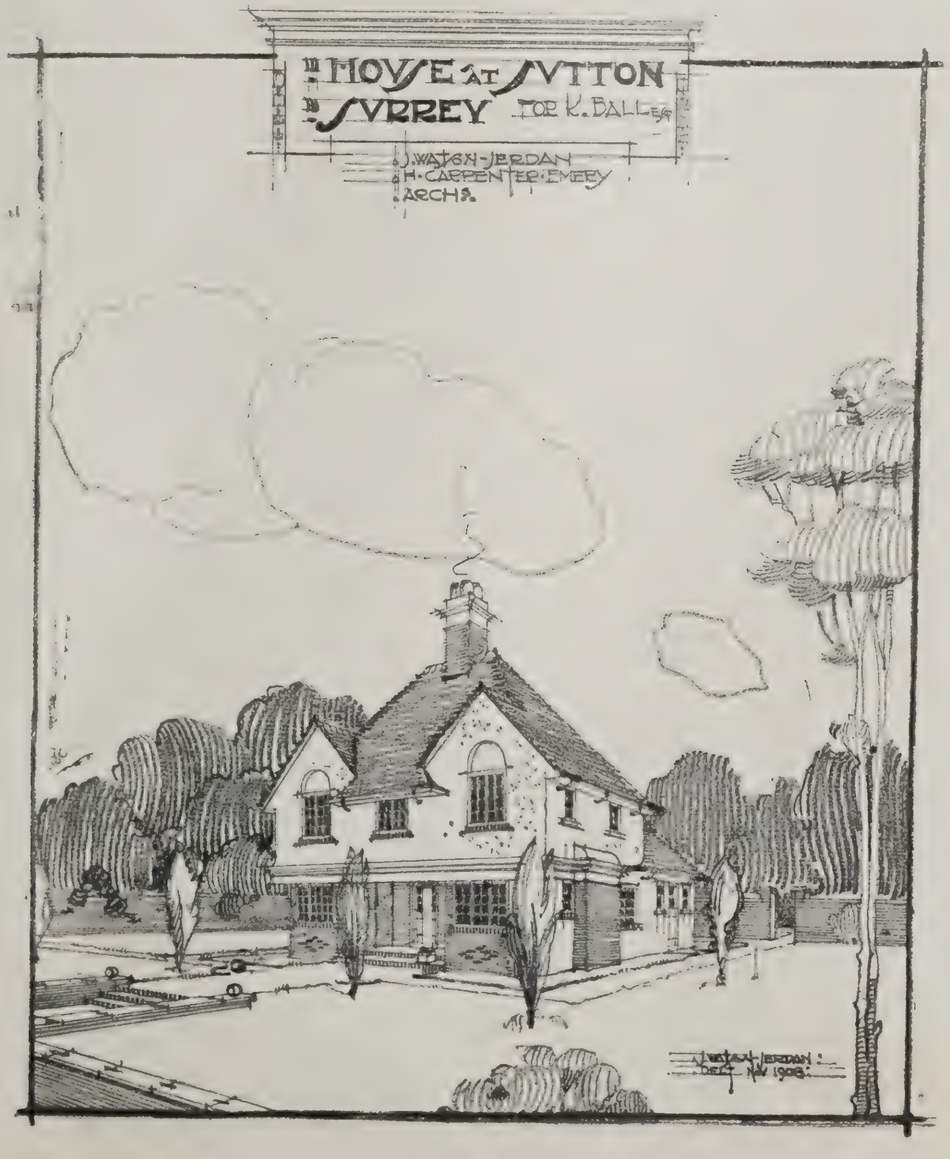
The *central* hall still holds its own, and the Board of Education appears to regard it as the best type of plan, as witness a general note in "Principles to be Observed in Designing and Fitting-up New Buildings for Use as Secondary Schools," which reads as follows:—"The rooms should be grouped compactly and conveniently in order to secure easy and effective supervision and economy in working and maintenance. Generally speaking, in the case of schools where the number of scholars is considerable, this result can most satisfactorily be secured by placing the class-rooms on three sides of and opening from a central hall."

Assembly Hall.

Differences of opinion upon secondary school planning will, I think, be found mainly on this question, and a marked tendency may be perceived to provide a hall which is not a passage-room to the various class-rooms, corridors, etc. Such an arrangement affords a room not only for general assembly, but one which may be also used (free from interruption) for various purposes, such as examinations, singing, drawing (if there is no art room), and any assembly of a portion of the school without disturbing the remainder, for any of which purposes a central hall is not so convenient. On the other hand, a central hall is, before all things, adapted for good supervision, but is this of extreme importance in a school with an adequate and thoroughly qualified staff? Expressions of opinion from head masters and mistresses certainly incline me to think not. If, then, a hall is required to be used for all or any of the purposes I have just mentioned, a *central* hall does not appear to be the best arrangement which could be adopted; if, on the other hand, supervision of teachers and students is of paramount importance, then the claims of the *central* hall plan cannot be disputed.

The Board of Education, as I have already pointed out, is very definite upon this question, and in addition to the clause I have already quoted, goes on to say: "Where more than one floor is necessary, the upper rooms can be entered from a gallery which should be in full view of the hall."

I know of elementary schools planned upon these lines which have been found noisy and inconvenient; possibly the better discipline of a secondary school would prevent the former; if so, might it not also ensure satisfactory behaviour without such elaborate provision for supervision? Fortunately, the Board of Education, while offering guidance, do not insist upon an abject submission to such guidance, and express their willingness to consider other suggestions in the following words:—"The Board recognise that, owing to the wide difference between the various grades and kinds of secondary schools, and pupil teachers' centres, it is undesirable to attempt to lay down any hard and fast rules as to the actual method of planning to be adopted except on points of fundamental importance."



As in the case of elementary schools, I will now proceed to discuss the points upon which an architect will need to be informed in planning a *secondary* school.

Points in Planning Secondary Schools.

1. With regard to the number of children to be accommodated, the Board of Education makes no suggestion on this point; personally, I know of no recent secondary school which accommodates more than 400 scholars in one department, and from 200 to 300 appears to be a very usual number.

2. In what number of departments is a school to be planned? As infants have no longer to be considered (except that a Kindergarten is sometimes provided in connection with a girls' school), only two remain. Curiously enough, the Board of Education offers no guidance as to whether a school shall be in two departments—a mixed school, or entirely separate schools for boys and girls. As both are being built, there seems no doubt either that differences of opinion exist, or that motives of economy have probably borne their share in a decision, as in the case of elementary schools.

An arrangement which appears to be a sensible one on both educational and economical grounds (at any rate, so far as the cost of buildings is concerned), is to plan a school for boys and girls with hall and class-rooms separate for each, but with certain rooms for special instruction—such as chemical laboratories, lecture rooms, art rooms, gymnasium, etc., in common. It will be found that a time-table can be arranged which will permit of these rooms being used in turn by boys and girls, and economy is effected by not having to provide them in duplicate.

The *merit* of "mixed" or "not mixed" education in secondary schools, I think, we may conveniently leave to educationists to settle.

3. Upon the question of the number to be accommodated in the various class-rooms, we find very clear instructions in the Board of Education Rules, and I will venture to quote the section which deals with it in full:—"In every school there must be class-rooms at the rate of four for every 100 scholars. There must be in the class-rooms, as distinct from the laboratories and other rooms, sufficient accommodation for the whole number of the scholars for whom the school is intended to provide. A lecture-room, however, if suitable for class teaching may be counted as a class-room for not more than thirty, or less than fifteen scholars. Class-rooms should be fitted with single desks, having a gangway of not less than 18in. between the rows and between the desks and wall on each side, 1ft. between the last row of desks and the wall, and a clear space extending the full width of the room of not less than 7ft. 6in. between the front row of desks and the wall, for the teacher. The desks may be reckoned as occupying a space of about 3ft. by 2ft. in order to provide the requisite distance between the front of one and the back of that next in front of it."

Floor Area.

To provide for this a floor area of from 17 sq. ft. to 18 sq. ft. per head will be required, according to the size of the class. In cases where it is found difficult to provide this amount, the Board will be prepared to accept a minimum allowance of 16 sq. ft. per head provided that the arrangement can be shown to be satisfactory. In this case the desks should be placed closer together in pairs, with a gangway of not less than 2ft. between the double rows of desks.

---

*Extracts from a paper read by Mr. Herbert T. Buckland, before the Architectural Association, on February 5th. The first portion of the paper, dealing mainly with elementary schools, was given in our issue of February 10th, p. 113.

Where fireplaces are provided they should be placed in the outer corner of the room in order to avoid interference with the master's platform and blackboard.

Stepped seating should not be used."

Intimately bearing upon this and the total acommodation of a school, is an introductory note, which reads as follows:—

"It is important to remember that as the actual numbers in a class can seldom be made to correspond closely with the various sizes of rooms provided, the nominal accommodation as shown by the plans should exceed the number for which the school is intended to provide."

Accommodation, Nominal and Actual.

This means, of course, that, as a general rule, a school which has nominal accommodation in class-rooms for, say, 225, will only be considered as providing accommodation for, say, 200 children.

The charming inconsistency of the promoters of schools' competitions is very noticeable with regard to this point; invariably the question goes to them as to whether the cost of the building is to be based upon the nominal accommodation shown upon the plans or upon the number for which the school is intended to provide. It is scarcely necessary for me to say that the invariable reply is the latter. Now, if the price allowed per head is £40 (which, by the way, it seldom is, and more often should be) the difference amounts to £1,000, and it is entirely absurd to ask for the extra accommodation without expecting to provide for it in the cost.

Number of Floors.

As to the number of floors, the rules offer no guidance except in so far as they assume that more than one floor may be necessary in a clause I have already quoted in connection with the question of a central hall. It reads as follows:—

"Where more than one floor is necessary, the upper rooms can be entered from a gallery, etc., etc." I think there is little doubt that a two-story building is the most convenient. I am not acquainted with one consisting of a ground floor only, but there are many of more than two stories. If the desirability of more than one floor is admitted, what, then, is the best apportionment of the various rooms to the separate floors? Personally I consider it important to have all class-rooms on the same floor as the hall, and this preferably the ground floor.

Laboratories, lecture rooms, art studio, etc., all rooms which are occupied by each class in turn for a portion of the day, can be placed conveniently on the upper floor.

The general class-room accommodation in a secondary school is so similar to that of an elementary school, that I need not spend time in discussing it, but the following comparative areas, as required by the Board of Education, may be of interest:—

In assembly rooms of *secondary schools* at least 6 sq. ft. per scholar, and if the school is for less than 150, 8 sq. ft.

In *elementary schools* not more than 4 sq. ft. per child is allowed, and 3½ sq. ft. is considered sufficient.

In class-rooms of secondary schools 17 sq. ft. or 18 sq. ft. per head is *required*; while a minimum of 16 sq. ft. may be accepted. In elementary schools 9 sq. ft. is required for infants, and 10 sq. ft. for other children. I admit I find these differences somewhat puzzling; the schools are both for the same children (in the one case when they have, some of them, grown older); and the question naturally presents itself: Is the one too large or the other too small? In a small elementary school with a department for only 200, I think the latter, as even on the 4 sq. ft. basis the hall will only be 800 ft. in area. Now the children in an elementary school have to use this hall for drill in wet weather, and a space of 40 ft. by 20 ft. to drill in is not found entirely satisfactory.

If a secondary school has a gymnasium, the assembly hall is not used for drilling; nevertheless, it has twice the area of that in the elementary school.

With a view of taking more than one class in a room for certain lessons, the provision of a lecture-room is desirable; this the Rules state should accommodate not less than thirty scholars, and may be large enough to hold more; it should be constructed, as far as possible, on the principle of a theatre, with rising seats. There must be a floor space of not less than 14 sq. ft. per scholar for the first thirty scholars, and 12 sq. ft. for each scholar above that number. This room, as previously stated in the clause relating to classrooms, "if suitable for class teaching, may be counted as a class-room for not more than thirty scholars."

Rooms for Special Instruction.

It is not within the scope of a paper like this to go into details with regard to the various rooms which are needed for what one might call special instruction. I shall, therefore, only attempt to touch upon points which seem to present matter for discussion. Upon the subject of laboratories the rules say: "A physical laboratory should be free from vibration, and for that purpose placed on the ground floor, where possible, and should be capable of being darkened." This instruction with reference to the position of the physical laboratory is fairly definite, and has severely exercised the mind of many a beginner in the planning of schools; but is it of vast importance? If so, why are so many physical laboratories placed on an upper floor; as a matter of fact, the teaching of physics in a secondary school is not of such an advanced character as to demand the extreme freedom from vibration which can only be secured on a ground floor. On the other hand, a point very lightly touched upon in the Rules is the balance-room; these are the words:—"If there is no balance-room a separate place in the laboratory should be assigned for balances." It is, I think, very generally agreed that a balance-room is essential, as it is important the balances should be kept free from the chemical fumes. One of the advantages to be gained by placing the various rooms for special instruction on the upper floor is the improved lighting which can usually be achieved; it is scarcely possible to get too much light in laboratories, and very frequently if these rooms are on an upper floor, light can be obtained from more than one side by judicious planning. If good light is essential in laboratories, it is more so in an art room. The chief function of an art room, if the rules of the board are to be interpreted literally, is to defeat the object of its own teaching by utterly spoiling the architectural design of the building in which it is placed. In speaking of the advanced art room, this is what will be found:—"This room should be lighted from the north side by a single large window, square at the top to give as much light as possible."

Concerning Windows.

If one is lucky in the matter of aspect, one may be able to get this single large window square at the top, facing an area, or concealed from view by roofs; but if the aspect is not favourable, and one of your important elevations faces north, you will need the skill of a Michael Angelo to make the type of window an art mistress sighs for harmonise with the scale of your building.

And is this north light in such abundance the one and only light which will enable the scholars in a secondary school to benefit by the teaching given for an average of eighty minutes per class per week? I put the following question to the headmaster of one of the first art schools in the Kingdom: "From which quarter would you prefer the light of an art room?" His reply was: "I don't much care from what quarter it comes so long as I can get plenty of it, and still have enough if I have to shut out some when the sun gets in. I prefer some sun, as I may need a class to study the effects of sunshine on various objects; flowers and foliage under sunshine have new revelations for us."

A north light for a studio painter of large pictures is, I believe a *sine qua non*, but a secondary school is not dealing with such, and I question whether sacrifices in the design of a building should be demanded where the need does not really exist. For all practical purposes, in my opinion, a well-lighted classroom with ordinary windows, possibly from one side and an end, or two sides, will serve admirably for the kind of art teaching which is given in a secondary school.

Dining Halls and Kitchen.

A point with regard to dining-halls and the kitchens in connection with them, which is, perhaps, worthy of note, is the desirability of providing a separate entrance for tradespeople; this will, generally, I think, be found a great convenience. A library in a secondary school, although not insisted upon by the board, is certainly a very desirable attribute. As far more time is spent by teachers in secondary schools in preparation work, correcting papers, etc., than is the case in elementary schools, larger and more comfortable rooms for their use will need to be provided, and the headmaster will require a really spacious room, as books and papers with which he has to deal will occupy a lot of room.

In cloak-rooms twice the length of hanging space is required as compared with elementary schools, and in neither should lavatory basins be placed in the cloak-room.

Area of Windows.

A point which will materially influence the architectural treatment of the elevations is the large area of window lighting required by the Rules, which state that "The area of window glass should approximate to one-fifth the area of the floor space in rooms used for teaching, and in other rooms not less than one-eighth." I doubt if so much is often given or really necessary. I need hardly mention that light is required to come to the left-hand side of the scholars. A point of importance is emphasised in the following clause:—"Unless the top of the windows be more than 12ft. above the floor, the plan should show no space more than 20ft. from the window wall in any room used for teaching."

Sanitary Accommodation.

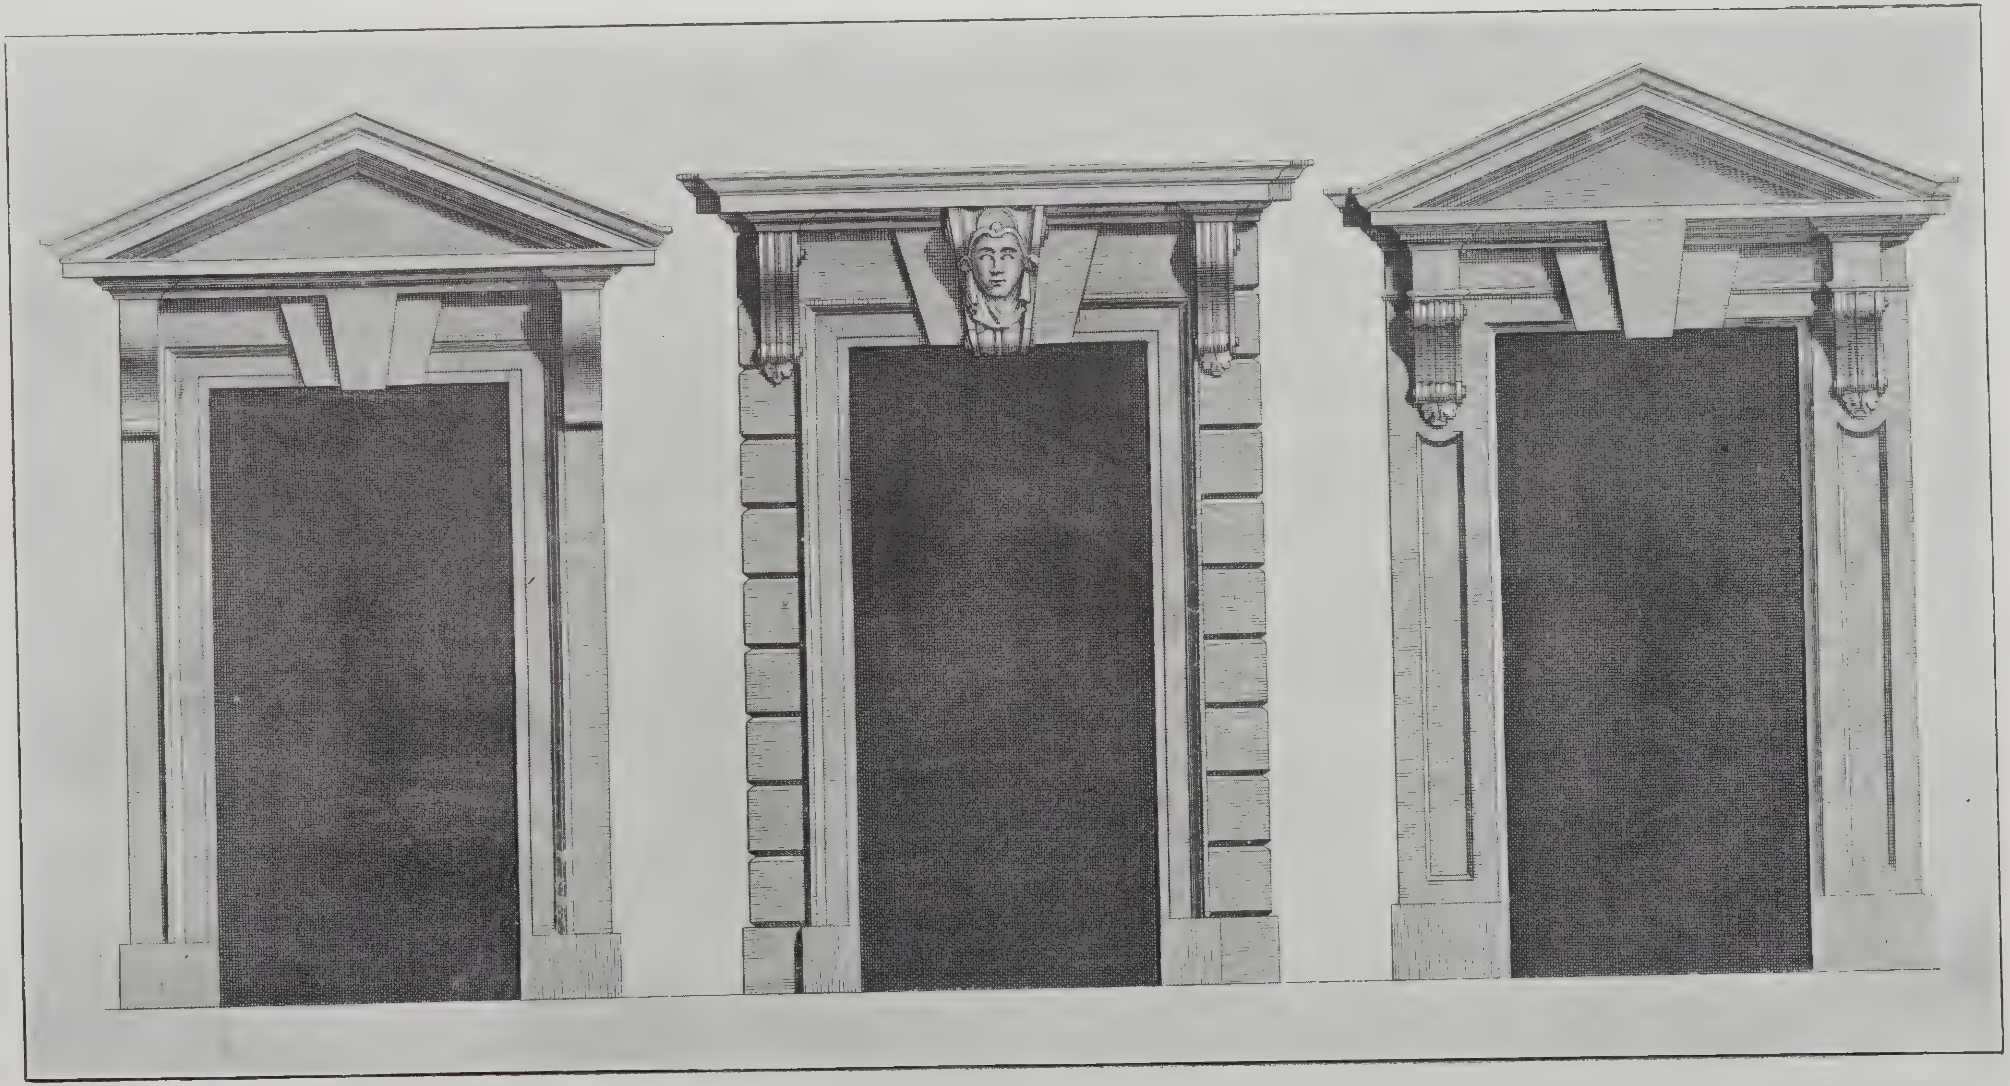
With regard to sanitary accommodation, it is suggested that the girls' offices should be in the main building, and those for boys completely disconnected and at a short distance from the school. In a girls' school some headmistresses advocate the distribution of a small number of water-closets on the various floors in addition to a main block of offices. Automatic flushing for closets is undesirable, and each closet should be fitted with its own apparatus. In elementary schools an automatic flushing system is almost universally, I think, adopted, although I understand that many educationists advocate the employment of an independent flushing apparatus, with a view of inculcating habits of decency from the earliest moment. In one case I know of where efforts in this direction were made in an elementary school, the result was not satisfactory, and an automatic system had ultimately to be installed.

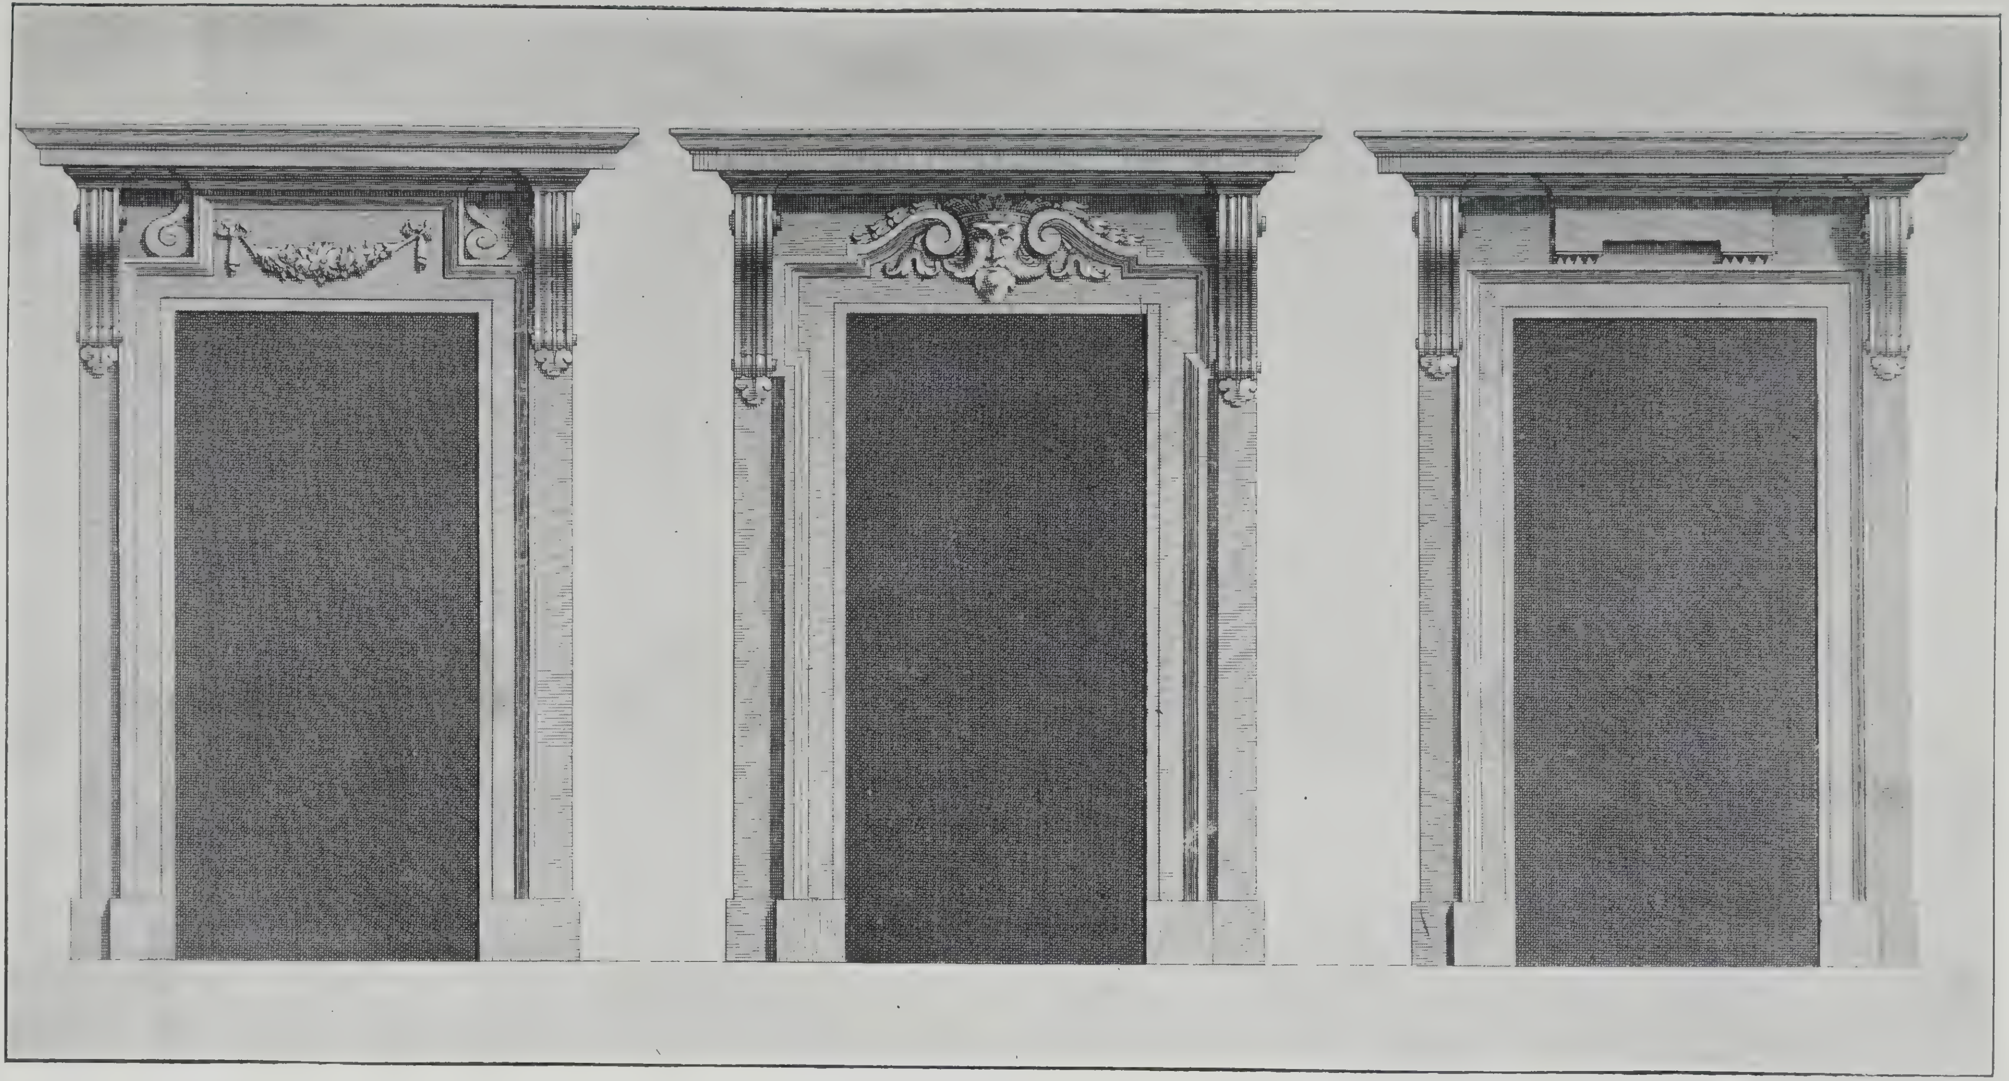
(*To be concluded.*)

Our Plate.

We give this week another plate, the last but one, of details by James Gibbs. The subject is doorways, and it is almost needless to say that the dignity and refinement to be expected from the architect of St. Mary-le-Strand, are here exemplified in a remarkable degree.

Supplement to THE BUILDERS' JOURNAL AND ARCHITECTURAL ENGINEER, *Wednesday, February 7th, 1900*





SOME DESIGNS FOR DOORS BY JAMES GIBBS.

BLACKPOOL CENTRAL LIBRARY COMPETITION.

All the designs submitted in the above competition—about 140—have been on exhibition at the Winter Gardens Pavilion, Blackpool.

Judging by the large number of people seen inspecting the drawings, this competition must have created unusual local interest. The majority of the designs show a high standard of work in plan, design, and draughtsmanship. It has, therefore, been a difficult task for the assessor, Mr. G. H. Willoughby, of Manchester, to select the premiated plans. The general opinion regarding the award is that it is quite satisfactory to all concerned.

The following is the assessor's report, which shows the points he has considered most in making his adjudication:—

ASSESSOR'S REPORT, NEW CARNEGIE LIBRARY.

"Gentlemen,—Acting on your instructions, I have made a most careful examination of the whole of the drawings submitted for the above important public buildings, and herewith have pleasure in laying before you my adjudication on same.

"Before doing so, I feel called upon to emphasise the remarkable response the architectural profession has shown to your invitation—many able and carefully thought out schemes having been sent in; consequently the difficulty of arriving at an equitable assessment has been greatly increased.

"Every design has received my most careful study and investigation, and as a result of my anxious deliberations, extending over many days, I have no hesitation in awarding the set of drawings numbered 41 the honourable position of first place.

"The author of this design has shown conspicuous ability in successfully dealing with the problem, both from the points of arrangement, construction, and design. The scheme is an excellent one, and admirably adapted to the several purposes of your intended structure as set forth in your 'Particulars, instructions, and conditions of competition.'

"For a practical working library of the character you contemplate erecting, and providing complete oversight and control to every department, with economy of administration by a limited staff, the general arrangements of the premier design would be exceedingly difficult to improve upon.

"The author has thoroughly mastered the essential points to be striven for in successfully planning a town library, and the strength and refinement shown in the internal as well as external treatment clearly indicate he is master of his craft.

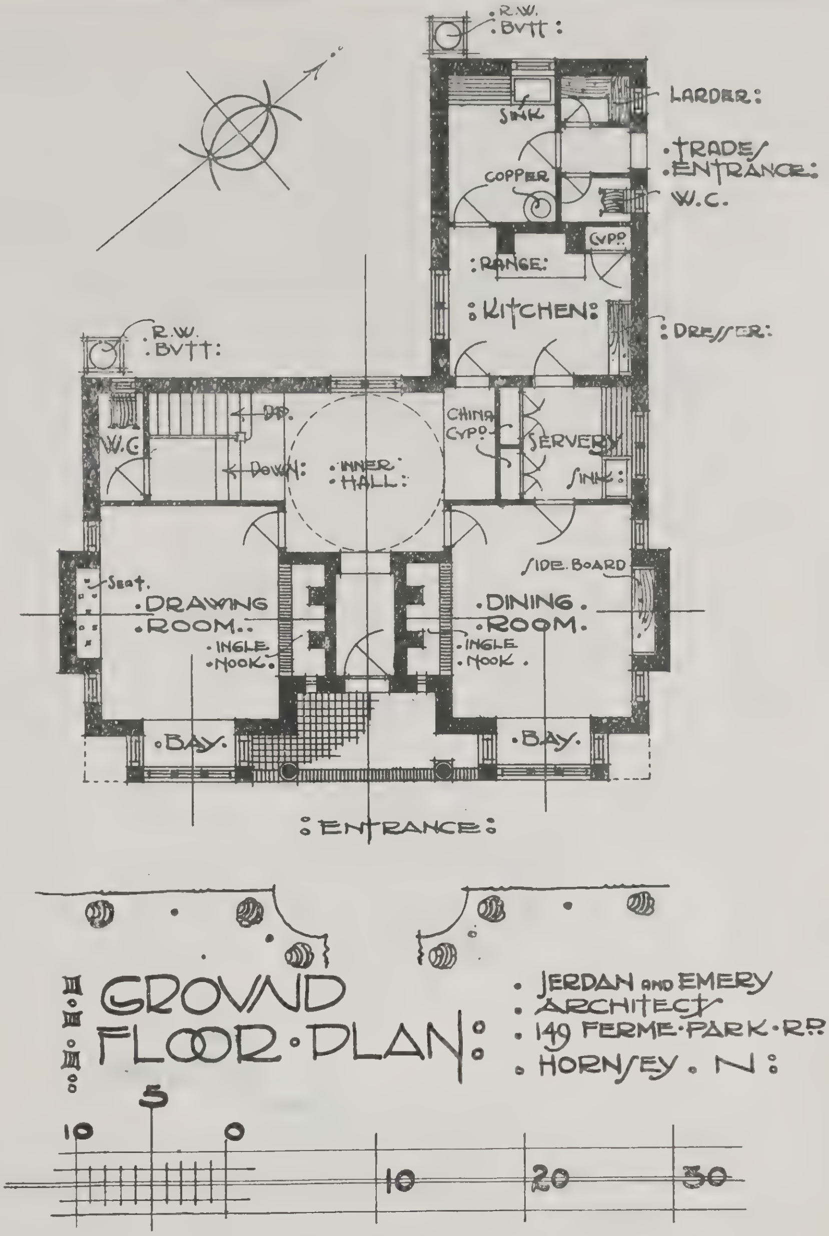
"The architectural conception of the elevations is scholarly, dignified, simple, and appropriate for execution in brick and stone. Monumental in character, a symmetrical facade is obtained to each street, flanking the main entrance doorway, which is wisely placed (as suggested by you) at the corner of same.

"The doorway is made the principal feature of the design, being marked by a low dome, surmounting a handsome colonnade of polished red Aberdeen granite.

"Ample provision for efficient light and ventilation has been carefully made—also the utilising of all roofing to its utmost capacity should be noted.

"Taken as a whole, the premier scheme (No. 41) is an economical one. The prices per foot upon which its author has moneyed out the cubical contents ought to be adequate to erect the building (as designed) in a satisfactory manner, and in accordance with your particulars and instructions, due care being exercised in the detailing generally.

"Respecting my decision as to the awarding of the second and third premiums, I experience a grave difficulty in advising you. Although many good designs, carefully conceived and conscientiously developed, have been sent in, yet in every scheme certain blemishes and points of weakness are to be found when compared with No. 41.



HOUSE AT SUTTON.

"There are, however, five designs which I have finally chosen, after a most exhaustive scrutiny, viz., Nos. 47, 38, 62, 10, and 104, each of which contains certain merit of its own, either in arrangement or design, or both, coupled with a sincere and earnest effort to solve the problem faithfully. To each of these I have felt called upon to award the commendable position of 'equal second.' Whilst doing so, there are several most able designs (including Nos. 133 and 117) I have been compelled to disregard consequent on their excessive cubical contents.

"With your definite instructions as to cost clearly before me, viz., Paragraph No 3, 'The total estimated cost of the building must not under any circumstances exceed the sum of £12,500, and all designs submitted must be prepared on this basis,' I had no alternative but reluctantly to pass over same.

"The profession's remarkable response to your invitation, 140 designs), which at the lowest estimate I compute have incurred an expenditure of £3,500 to produce, emboldens me, as your assessor, respectfully to suggest that, under such exceptional circumstances, your Council favourably consider disbursing the whole of the premium money, viz., 100 guineas, equally among the authors of the five designs next in order of merit to the premier one, whose author, I trust, will be appointed architect for the work.

"It would be a generous act on behalf of your Council, and some return to the competing architects for the enormous amount of labour and money fruitlessly expended by them. My adjudication, therefore, is:—

"First—No. 41, to be appointed architect for the work on the terms agreed.

"Equal second—Nos. 47, 38, 62, 10, and 104, each to have a premium of 20 guineas.

"Nos. 60, 128, 103, 83, 18, 110, 21, 36, and 120, I consider are all worthy of 'honourable mention.'

"I can only affirm that should you Council accept my awards and adopt scheme No. 41 for examination, in my judgment they will secure the best design submitted, and one that most fully and adequately embodies their requirements—taken as a whole.

"Remembering the importance of this competition to the profession generally, and that doubtless schemes have been prepared by architects practising in all parts of the Kingdom, I would earnestly ask the Council to arrange for the whole of the designs to be publicly exhibited for at least one full week. This would give every competitor the opportunity of personally inspecting same, as well as perusing also a copy of my report, upon which the adjudication has been made.

"In conclusion, I desire to express my sincere thanks to his Worship the Mayor, the Town Clerk, and the Borough Engineer, for the admirable arrangements made to assist me in fulfilling my difficult task, also for the absolute privacy and entire immunity from any interference or distraction I en-

joyed throughout my somewhat lengthy examination.—Your obedient servant,

"GEO. H. WILLOUGHBY.

"Parr's Bank Chambers, Manchester,
"February 1st."

Design Placed First.

This position has been awarded to the scheme of Messrs. Alex. Cullen, Lochhead, and Brown, Brandon Chambers, Hamilton, near Glasgow. At a first glance this set of plans appears most successful, but on closer examination it appears to the writer that there are a few details which should receive further consideration before the working drawings are prepared.

Starting with the ground plan, it seems to the writer that, in following the main stairs from the lower to the upper floor, the head room, and the lighting might be improved. To light the entrance hall by means of glazed screens does not realise one's ideal. The news and magazine rooms are of peculiar shape, and there are other rooms of which the shape could be improved. No cross-ventilation is shown for the large public rooms. The back portions of the magazine, news, and juvenile rooms receive only borrowed light from the top lights of the lending library. Entrance to the girls' room can only be obtained by passing through the boys' portion of the juvenile reading room. Separate entrances were asked for. All the reading tables are away from the windows, and placed at the back, a low book-case and passage-way occupying the valuable window light. The traffic between these two rooms, and juveniles' examining books, would seriously interfere with the light and comfort of the readers. The book-lifts do not deliver directly into the lending library, being separated from the latter by a staff door. The arrangement and position given to the staff conveniences in the basement could easily be improved upon.

On the first floor the plan looks compact, but some of the smaller rooms are not happily placed. The ante-room is at the entrance end of the lecture room. The

upper floor crush hall is too small for 350 people to crowd out at the closing hour. Both the doors to men's and women's lavatories are on the opposite side of an anteroom, and face one another—this should be re-arranged. Why no w.c. or cloak-room space and counter, seeing these were asked for? The position of committee-room is too far from the librarian's room. Reference-book storage could have been near the reference library for the use of the public; as shown, it is entered off a private corridor, with two doors between the rooms. Again, the book lifts deliver at a distance from the store and reference library. We note four sets of conveniences for the use of the staff—this is lavish for a staff of eight persons—those in the basement are useless, and although stated in the conditions, ought never to have been placed there. The elevations form the best part of this design, and probably they have influenced the award to a considerable extent. An improvement could be made by emphasising the entrance doorway and treating it boldly. The stopping of the main cornice at the end features is not quite happy, and the wall pilasters end abruptly against the entablature. Owing to the adjoining gables and high end features, the corner dome appears squat, and could be raised higher with advantage. The columns supporting cornice will be in red granite, and the internal woodwork to the principal rooms in Austrian oak. Taking the great amount of stone-work in the elevations, also the height of the rooms, and the cubical contents—priced at 5d. and 7d.—we know from experience that the cost of recently-erected libraries is higher per cube foot than the foregoing, for plainer buildings and less expensive materials. The contents of this design amount to 418,369 cube feet, wi 18,369 taken at 5d. and the larger cube at 7d. per foot. The total cost of £12,499 includes the sum of £450 for parapet walls, gates, and railings.

Other Premiated Designs.

Five designs have been awarded second position, and receive equal premiums. The first scheme mentioned is that of Messrs. S. B. Russell and T. E. Cooper, 11, Gray's Inn Square, W.C. The plan of the lending library is a trifle original, but not good for supervision—seeing that the attendant is centrally placed in one room only. The second scheme mentioned was the work of Messrs. David Thomson and Christopher Bristow, 7, Cranwich Road, Stamford Hill, London. The writer does not care for this design. A more successful set was that of Messrs. Cooper and Slater, 13, Richmond Terrace, Blackburn, though the plans were open to improvement in detail, while the elevations were the least praiseworthy part of the design. Mr. Charles H. Potter, 20, Cross Street, Manchester, submitted a fine set of plans, coupled to interesting elevations, worth the position given this scheme. Another set that was well drawn, but was rather unsatisfactory as to the detail requirements of a library, was submitted by Mr. H. R. Gardner, Reigate Road, Leatherhead.

Other Designs.

"Honourable Mention" was awarded to a large number of designs, the following architects being specially mentioned:—Messrs. H. Norton, of London; Briggs, Wolstenhome and Thornley, of Blackburn; Edmund Cratney, of Wallsend-on-Tyne; Hatchard, Smith and Son, of London; Walter Hanstock and Son, of Batley; Myrtle Smith, of Chelsea; F. E. and A. Milne, Glasgow; H. Lord, Manchester.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Feb. 20	GUILDFORD. Footbridge over the River Wey. Designs are invited for a light footbridge in oak or other materials. Particulars from C. G. Mason, C.E., Tuns Gate, Guildford. Designs to be sent to W. Shawcross, Hon. Sec., 108, High Street, Guildford.
Feb. 20.	PENCLAWDD (WALES). Chapel. Plans are invited for a new chapel to contain 800 seatings. Approximate cost of chapel, including heating and acetylene lighting apparatus, £3,000. Premium—five guineas to the architect whose plan *the Committee may select*. Plans to be deposited with John Rees, Secretary, Penian, Penclawdd, S.O.
Mar. 1.	TORRINGTON (DEVON). Memorial Cross. The Committee of the Rolle Memorial invite designs for a memorial cross (preferably of granite), to be erected in the churchyard, Torrington. Cost, inclusive of erection, &c., not to exceed £100. Premium £2 2s. for the selected design, but no other charge or expense. Particulars from George M. Doe, Town Clerk, to whom designs are to be sent.
Mar. 8.	*PONTARDAWE (WALES). Offices for the Guardians, in Holly Street. Premium £10 10s. The premium is offered by the Guardians "for plans with abridged specification, *which in their judgment* are best suited." Particulars and conditions from C. B. Jenkins, Clerk, Herbert Chambers, Pontardawe, S.O., Glamorganshire.
Mar. 17	†NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3.500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council. Stanley S.O., Co. Durham.
Mar. 31	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days.
No date.	BLACKBURN. The Blackburn Small Holdings and Allotments Committee have decided to invite architects and surveyors in the Borough to submit competitive plans for the laying-out of the estate at Oswaldtwistle, recently purchased for small holdings. Premiums of £25, £10, and £5 are offered.

*We are advised by Mr. Jenkins that the supply of particulars and sketch plans is exhausted and no further applications can be entertained.

† The Royal Institute advises members not to compete.

Secondary School, Elland. Yorkshire.

The Halifax Architectural Society have offered assistance in drawing up conditions for a competition in connection with the proposed new secondary school at Elland. This offer has been made in view of the unsatisfactory nature of several recent competitions for similar buildings.

Garden Suburb Cottages, Derby.

The National Housing Reform Council are proposing to institute a competition at Derby for the building of garden suburb cottages, and a local committee has been formed to carry out the preliminary arrangements. The prizes will consist of silver and bronze medals.

Palmer's Green Congregational Church.

The designs submitted by Messrs. George Baines and Son, 5, Clements Inn, Strand, London, W.C., in a recent competition for the above have been adopted, and the erection of the buildings is to be at once proceeded with.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

The querist's name and address must always be given, not necessarily for publication.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Such answers will be forwarded to the querists promptly on receipt from the respective experts, but the Editor will not be responsible for any delay that may arise. The fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies. Every effort is made to ensure correctness, but Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

The Editor expressly declines to be held responsible for any mistakes or inaccuracies that may occur, nor does he undertake to satisfy in every instance the querist's demand. The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Silent W.C. Wanted.

KEITH.—D.J.C. writes: "Is there an absolutely silent water-closet on sale?"

There are three points from which objectionable noise may arise, viz., from the ball-cock during the filling of the flushing cistern, from the air in the flushing pipe during the termination of the flush, and from the water entering the w.c. pedestal with too great a force. There are many arrangements that are more or less silent—for example, Doulton's special compact closet, with 3-gallon flushing cistern just above the seat; and the querist might inspect this firm's patent pneumatic supply valve; or Twyford's "Convenient" combination basin and cistern.

HENRY ADAMS.

Steel Columns and Struts.

THORNTON HEATH.—P.C.E.B. writes: "Will you inform me as to the value of the constant 'F' and the variant 'Cant' in Gerdon's formula $\dfrac{F}{1+c\left(\dfrac{l}{d}\right)^2}$ for steel columns and struts applicable to the various cross sections. I am only able to find these for the more or less obsolete cast and wrought iron struts. In 'specification' I find certain information given for solid rectangular and circular steel columns regarding the 'variant,' but no information applicable to the 'constant' or to the now almost universal type of joist or built-up sections."

The principal reason why the figures for the constants in Gordon's formula are not given for mild steel columns in many of the constructional books is that Gordon's formula is rapidly going out of use in favour of Rankine's somewhat similar formula.

Gordon's formula is

$$\frac{P}{A}=\frac{F}{1+C\left(\dfrac{L}{d}\right)^2}$$

where d is the *least* breadth or diameter of the section. Rankine's formula is

$$\frac{P}{A}=\frac{F}{1+a\left(\dfrac{L}{k}\right)^2}$$

where k is the *least* radius of gyration of the section. The advantage of Rankine's formula is that the variant a is the same for all shapes of the same material, whereas c in Gordon's formula depends on the shape as well as on the material.

For mild steel built-up columns the following figures may be taken:—

$F=6$ tons per sq. in.

$c=\frac{1}{3\;\;0}$ for sections with only one I beam.

$=\frac{1}{430}$ " " " two or more I beams or channels.

$b=\frac{1}{6000}$.

The formula then gives the safe load per square inch on the column.

L is to be taken as the length of the *equivalent pin-jointed column*; if the ends are fixed, L = ½ length of the column.

The matter is somewhat fully shown in the question of column formulæ in the recent text-book on "Theory and Design of Structures," by Ewart S. Andrews (Chapman and Hall, Ltd., 9s. nett), and we would recommend the querist to consult such book if he requires further information.

A.

Height for Dwarf Wall.

IPSWICH.—C. R. writes: "Please let me know the height of a dwarf wall as described for boundary walls in agreements used when new estates are laid out?"

Unless a height is specially mentioned in the agreement of tenancy or in the contract of sale, there is no particular height implied, beyond the fact that "dwarf wall" must be reasonably sufficient for the purpose for which it is intended. I have known them to be of all heights from 2ft. 6in. to 6ft.

F.S.I.

Architects' Book on Stresses.

BIRMINGHAM.—PIER STRAIN writes: "Please give particulars of a book on the calculation of strain on roofs and piers."

There is no book at present known to the writer which sufficiently explains the determination of stresses in constructional work, but a series of lectures to teachers at South Kensington upon "The Mechanics of Building Construction," will, when published, cover the whole ground. In the meantime, perhaps, Vol. IV. of "Notes on Building Construction" (Longman 15s.) will be the most useful.

HENRY ADAMS.

Responsibility for House Drains.

HARROW.—SANITARY writes: "Will you kindly inform me whether the builder or the Urban District Council is liable to correct faulty laying of drain to house? The defect is apparently either at the interceptor in front garden, a few feet from connection with road pipe to sewer, or the pipes are not laid to proper fall, as toilet-paper lies at the well of the interceptor, and in a few weeks clogs and half fills the inspection chamber with soil. The builder contracted to complete the house to the satisfaction of the district surveyor. The surveyor tested on the first day of the house being occupied, seven months ago, and was satisfied."

Neither. The responsibility is now the owner's. On "Sanitary's" showing, the builder did what he contracted to do, satisfied the district surveyor. The latter tested, and cannot be held accountable if he passed the work in good faith. It is probably quite sound so far as he tested it, and so far as his employers, the council, have any right to call upon him to test. The fault is most likely to be found in the particular make of trap that has been used, which ought to be of a self-cleansing form, with quick drop at intake, contracted at bend, short in itself, and holding little water, though with a good seal, and its discharge at outgo should be quite an inch below intake level.

INSTITUTE.

Determination of Building Line.

LYNN.—D. H. B. writes: "What is really the building line? Several villas are all built level; but now a builder is putting up a house 6in. in front of me or of the main building, but says he will keep the bay windows level with mine; still 6in. poking in front does not look well."

I conclude from your inquiry that an estate has been cut up for building purposes, and that the original owner laid out the streets and prescribed "building lines" in his "conditions of sale." These building lines must, of course, be adhered to, and I imagine that a complaint made by you to the effect that your neighbour was not respecting the building line, would be dealt with properly by the said owner or his surveyor. I advise you to lay the case before them. If the original owner has no longer any interest in the property, there is no doubt, legally speaking, that any one of the purchasers of his property may take action against another one who does not carry out his contract; but the question does arise, in my mind at least, "Is six inches worth making a fuss about?"

F.S.I.

What are Main Timbers?

HEREFORD.—INQUIRER writes: "Tenant has entered into a lease whereby landlord keeps the main timbers in repair. A question has arisen in regard to the floor boards, and the landlord contends that floor boards are not main timbers. Are they?"

Floor boards are most decidedly not "main timbers," in reference to the terms of a lease, and the tenant is, therefore, liable for their maintenance "Main timbers" are such as are structurally necessary for the upholding of the fabric itself, such as roof timbers, beams, and so forth.

F.S.I.

Architects at Messina.

NETHERTON.—READER D. writes: "(1) Are there likely to be any opportunities in or around Messina for architects? (2) From whom can the R.I.B.A. form of contract be obtained? (3) Are worked answers to the City and Guilds' questions in Quantities published?"

As we understand engineers have already been appointed to prepare plans for the rebuilding of Messina, and that the excavation of the ruins is being carried on, we are exceedingly doubtful if any architectural draughtsmen will be required there. Furthermore, the Italians are by no means behindhand in matters of building construction, even to the extent of employing reinforced concrete in many of their modern buildings. Regarding your second question, these can be obtained from the Secretary of the Royal Institute of British Architects, No. 9, Conduit Street, London, W., price 1s. Replying to your third question, we do not know whether worked answers are issued to questions of quantities set at the London and Guilds' examinations, but we should suggest that you write to the secretary at the Institute, Exhibition Road, Kensington, W.

Pavement for Slaughterhouse.

LITTLEHAMPTON.—R. C. B. writes: "What do you consider the best material to use and the best form of construction, for a floor in a slaughter house. Blue Staffordshire bricks seem to get filled up with fat, greasy matter; and Portland cement trowelled smooth off steel trowel is too slippery."

To give a good foothold, blue Staffordshire bricks, granite setts, or any form of stable paving are desirable; but, as you say, these get clogged with greasy matter and are troublesome to keep clean. The best floor is mastic asphalt, or concrete in situ. It is a matter of compromise, but with the mastic asphalt or concrete in situ paving less rake is required on the floor. Full particulars as to abattoirs are given in "Municipal Engineers' Specification," No. 2, price 3s., post free from these offices, or there is a book on this subject by R. Stephen Ayling, F.R.I.B.A., published by Messrs. E. and F. N. Spon, 57, Haymarket, S.W.

Echo in Assembly Hall.

DERBY.—E. N. D. writes: "A hall like that shown in the plate given in 'The Builders' Journal' of December 23rd, 1908, has been erected, and it is found that there is an inconvenient echo of the speeches, etc., What will stop this? What are the eight hangers for, with angular boxes attached? Are they to stop the echo? If so, how are they connected? The hall in question is 50ft. by 35ft. floor space, with a curved ceiling rising from walls 7ft. in the centre."

The "hangers with angular boxes attached" are evidently electric lighting pendants with the lamps screened to minimise the tiring effect of glare in the faces of an audience whose gaze is necessarily directed towards the platform. It is, however, quite possible that these fittings may not be without some influence in breaking up sound waves, and thus preventing echo. Wires are often stretched across domes and curved ceilings, textile hangings, and other non-resonant substances around the walls often has a similar effect. Experiment upon these lines is practically all that can be recommended. As an instance of the backward condition of the science of acoustics in this country, it may be said that a well-known architectural body, desiring to arrange for a paper on the subject, failed to discover an author willing to treat it. The only way in which a satisfactory acoustical result can be assured appears to be by the repetition of a form of apartment which has been proved successful in execution. G.

Pointing in Chimney Shaft.

"The brickwork joints of a chimney shaft are to be raked out and pointed (weather joint) in mastic cement and oil. Can you tell me, please, what price per yard super you consider fair for this work (exclusive of scaffolding, a lump sum for which has been agreed to)? Have never heard of pointing being done in mastic until the present case."

In reply to the above letter, which you kindly forwarded me, I have never heard of a brick chimney shaft being pointed in mastic cement and oil, and should imagine it to be the novel idea of a young architect. Rea's "How to Estimate" (Batsford, 7s. 6d. net), a most useful book, makes no mention of pointing in mastic, but gives "Pointing new work, flat-struck joint in lime mortar per yd. super., 1s. 9½d.; ditto in coal, ash or blue lias, 1s. 11d.; ditto in cement mortar, 2s. 1d.," and says "Pointing is best given out as piecework, which urges the men to execute as much as possible. A bricklayer who makes pointing a speciality is called a 'wigger' in some parts, and will point, including raking out joints and providing his own stuff, but no scaffolding, at a contract rate of 7d. per yard super, with wages at 9d. per hour. This is about 1¼ yard per hour." Also, "Raking out old mortar joints, colouring, and flat-joint pointing has been sub-let in London at 8s. per 100ft. super, for material and labour equals 1d. per ft. super., equals 9d. per ft. super." In cement mortar a bricklayer and labourer will rake out and point about eight yards super per day." Brick for carving is sometimes set in a mastic composed of powdered brick, of the same kind as the brickwork, mixed with boiled linseed oil and litharge, but there would be no advantage in using this for pointing a chimney stack.

Henry Adams.

Lessee's Liabilities.

Ipswich.—C. B. S. writes: "A lady has let a house for £25 per annum to a tenant who runs it as a boarding-house and makes, I am informed, over £200 profit. The tenant who is a doctor, and mayor of the borough, has the house on lease (several years of which have run), and writes to say that in future he will not pay the rent as per agreement, but will make a deduction equal to the amount of his income tax on that house. Has the tenant any claim whatever, in this respect, on the owner? Ought the owner to write at once and say that she will not allow any deduction, or wait until the deduction is actually made?"

So long as the tenant fulfils the conditions of his lease, it is no business of the landlord as to the profit he makes by his use of the premises. The landlord is liable for income tax, Schedule A (commonly termed "Landlords' property tax"), upon the income he draws out of the property, and no doubt the inland revenue authorities collect this tax (as is usual) from the tenant. The tenant is then entitled to be reimbursed by the landlord, when he produces the tax receipt, and is indeed liable to a penalty of £50 if he does not so allow the amount of the tax out of the next payment of rent. The assessment upon which the landlord should pay in this case is £25 (if that be the true annual rental value of the premises), less the amounts payable for tithe rent charge and landlord tax (if any), and a statutory allowance of one-sixth (£4 3s. 4d.) for repairs (if he does them). You should purchase one of the small handbooks on these subjects—a very useful and recent one being "Rates, Taxes, and other outgoings," published by Effingham Wilson, at 3s. 6d. F.S.I.

Use of the "Centrolinead."

Kingston-on-Thames.—Perspective writes: "(1) What other advantage has a centrolinead beyond bringing a distant vanishing point upon the drawing board? (2) What is the orthodox method of using this instrument? How is the position of 'mounts' or 'studs' fixed?"

(1) There is no other advantage beyond that named in the use of a centrolinead. (2) The method usually adopted for setting the instrument is one of trial. Two lines converging to the distant vanishing point are first obtained as shown in Fig. 1, in which A B, a face of the building, touches the picture plane P P at A. The plan lines are vanished to the station point S P in the usual manner, and from their intersection with P P verticals are dropped as shown. The corner A being in contact with P P is set up at A′ A′ to scale. To obtain the height of B, take in P P any point M P, draw line from same to S P, and from point B on plan draw line parallel to same, cutting P P in D. Drop perpendicular from M P1 to horizontal line H L at M P2, and from D through D′. Set up on D′ the actual height at angle, and vanish to M P2, cutting the projection of the plan point B by the vertical dropped from C, in B, B′. Lines drawn through A′ and B′ will now converge to the distant vanishing point. Having obtained these lines, the centrolinead must be adjusted until its edge will be truly along the three convergent lines, when the arms are moved along the pins. To do this a vertical line is first ruled and the guiding pins A and B are fixed on this at equal distances above and below the horizontal line (for convenience about 15in. apart). The ruling edge is then laid along the horizontal line, and the arms adjusted and clamped by the set screws C and D, so that they lie in contact with the pins. By this procedure the arms will be fixed at equal angles. The ruling edge is next moved up and down, with the arms still against the pins, to test whether it coincides with the upper and lower lines. This it probably will not do at the first attempt. The instrument is, therefore, readjusted by slackening the thumbscrews and increasing or diminishing the angle of the arms until this result is attained, when the centrolinead is ready for use, and all lines ruled by its edge, with the arms lying against the pins will converge towards one point. The pins A and B should be fixed with their long axes approximately perpendicular to the arms when the ruling edge is along the horizontal line. G.

ILLUSTRATING ANSWER ON "USE OF THE CENTROLINEAD."

FIRE-RESISTING CONSTRUCTION SECTION.

(MONTHLY.)

THE DANGER OF FIRE IN EARTHQUAKE ZONES.

It now seems certain that the dirge of the newspaper correspondents—"Messina is no more"; Messina is blotted out and will never rise again"—was a little premature; for the inhabitants and the Italian Government have other ideas, and despite the treacherous nature of the soil on which they live, are determined that Messina *shall* rise again. Already the task of excavating the ruins is begun, this work and the removal of the many bodies which, alas, are still lying under the debris, must occupy a considerable amount of time. Plans for the rebuilding of the city are being discussed; commissions are being appointed to consider the most suitable form of structure for the troubled area, and the experience of other countries subject to earthquake shocks, will doubtless be considered in formulating a decision. But in most of the discussions that have ensued, as a consequence of the recent terrible disaster in Calabria and Sicily, small attention appears to us to have been bestowed upon the important question of fire, which invariably follows in the track of severe and destructive earthquakes, and which, in the case of San Francisco, created greater havoc than the seismological disturbance.

Dangers of Civilisation.

Our present advanced state of civilisation affords so many opportunities for the outbreak of fires in such circumstances, that it appears, at first sight, impossible to provide for the needs of a population without incurring many grave risks. The fires burning in open grates may be thrown out on to floors or carpets by comparatively slight shocks, and by the fall of a building may come into contact with woodwork or other combustible material. Electric currents may, by the breaking of the cables, short circuit with similar effects; overturned oil lamps are a prolific source of fire; and in most cases such local beginnings of fires are turned into great conflagrations by the breaking of the gas mains and the escape of large volumes of coal gas. Indeed, the latter is pretty certain to be the predominating, if not the preliminary, cause of a great outbreak.

In the case of a town, lighted entirely by electricity, the danger of fire would seem to be considerably diminished, since in the case of great destruction the central station will probably share the fate of most of the other buildings, and the current would be at once extinguished at its source. Moreover, the use of electricity for motive power in factories and workshops, and for trams and trains, would eliminate the necessity for furnace fires, and its introduction for motive power, on a large scale, would establish that much desired dayload that lessens the production cost and gives opportunity for supplying current for lighting purposes at low rates. In towns on the seacoast, it should not be impossible to devise some means of water-power for the manufacture of current, which would obviate the danger of fire at the central station.

In a genial climate, such as that of Messina, the number of coal fires is very small, and such heating as is required could probably be effected by electricity also. This is not to overlook the fact that such a form of heating would probably prove more costly than by fires, but in earthquake zones it might be necessary to restrict the liberties of the inhabitants in some respects for their own safety, and the general well-being. The use of oil lamps would seem to us a risk that should altogether be eliminated, and similarly, coal gas is too dangerous an illuminant for towns on treacherous soil.

The new lighting medium, air-gas, would probably obviate the risks that attend the use of coal gas, since the gas on diffusion in the air, at once becomes harmless, there being only 1½ or 2 parts of petrol vapour to 98½ or 98 parts of air in its composition. The storage of the petrol required for its manufacture introduces a new and grave risk, however, and though largely used for lighting isolated dwellings, we are doubtful if it could, like coal gas, be manufactured in places well removed from the town and conveyed for any considerable distance in pipes.

Incombustible Buildings.

Apart, however, from risks inseparably connected with the supply of light and heat, there remains the momentous question of the combustibility of the buildings, and in this regard the grievous loss of life in the recent catastrophe has, unfortunately, obscured the issue in some directions. It is not sufficient that the buildings should be constructed in a manner to resist the earthquake shocks; they should also be able to resist fire. This fact gains point from the recommendation in a London daily paper, that the wooden earthquake-resisting houses of Japan should become the model for the rebuilding of Messina and Reggio. The wooden city is a city of the past, and, obviously, to build wooden cities is to invite at some future time a catastrophe more horrible and appalling than that which occurred last December. There is no case against modern building methods to be made out of the havoc on that occasion. Messina, as photographs of the ruins reveal, must have been one of the most flimsily built cities that ever existed. The fine stone fronts of its Palazzata concealed crumbling walls of rubble and 4½in. brick arches; and with the known possibility of earthquakes, it is more than likely this jerry-building was deliberately adopted to avoid expense in buildings that their owners felt might be suddenly destroyed. Cynicism could no farther go.

There has been a rather widespread advocacy of the steel frame building as the basis of future construction in the ruined cities, and so far as the frame is concerned, the lessons of San Francisco have proved its suitability for resisting shock. But if, as is usually the case, the walls of the steel-frame building are merely hung on to it, as it were, and if such structures are roughly shaken up, the probability is that the walls will shell off the frame and descend on to the passers-by, adding to the deal-roll and the panic. Indeed, the case of some of the 'Frisco buildings have already proved this.

Reinforced Concrete Monolith Structures.

Undoubtedly the type of building most fitted for earthquake zones is the monolith reinforced concrete structure, wherein the foundations, outer walls, partition walls, floors, staircases, and roofs, are firmly banded together by the reinforcement. At a conference in Paris, two or three weeks ago, this same conclusion was arrived at, and we believe the Italian authorities are not insensible to the merits of this form of building for the particular work in hand. It is said that there were three or four reinforced concrete houses in Messina and Calabria, which successfully stood the shock; but from some notes by "The Times" correspondent, we gather that they were steel-framed structures with reinforced concrete floors, and not of true monolithic construction. As an additional precaution, it would be desirable to widen the streets so that the collapse of a building does not block the street with debris and prevent the escape of the inhabitants or the approach of aid.

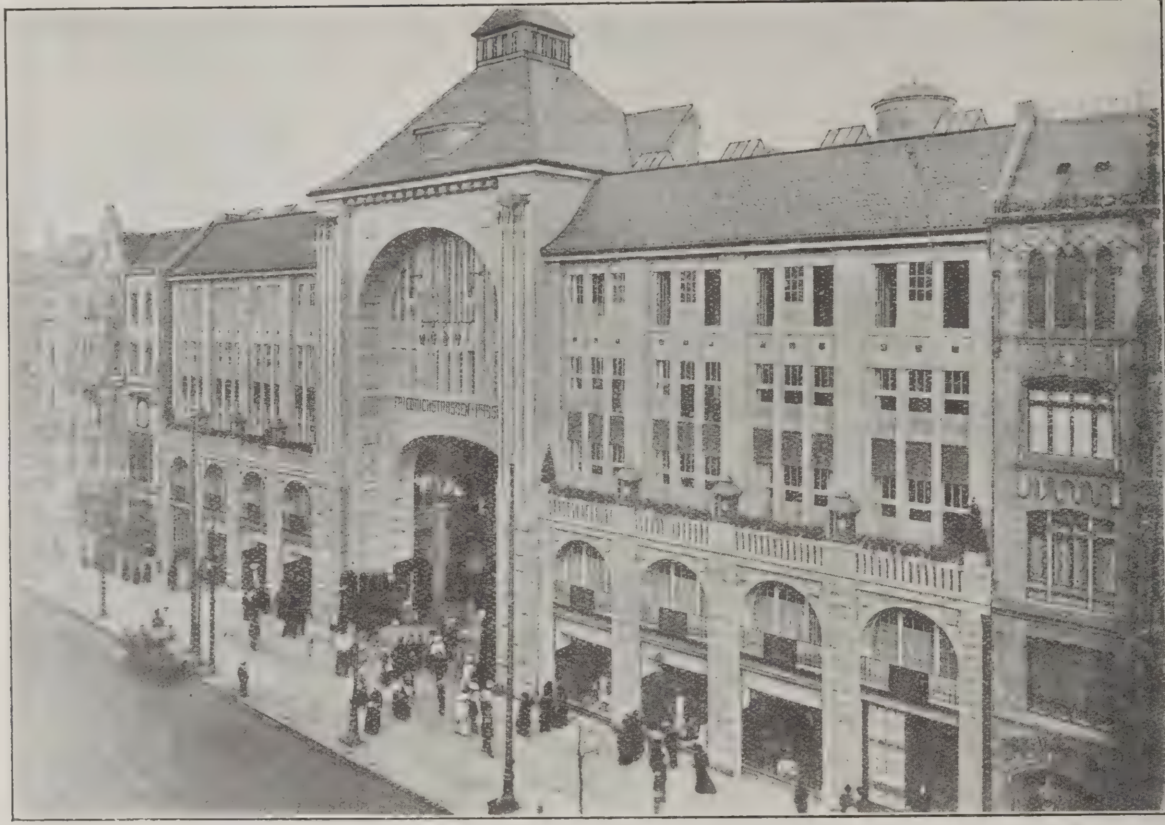
The lesson of San Francisco has borne fruit so far as the rebuilding of Kingston, our Jamaican capital, is concerned, for here the Government and other important buildings are being rebuilt in reinforced concrete; and we doubt not that in future this form of construction will be generally adopted in all earthquake zones, not merely as a safeguard for life and limb, but as an additional precaution against the horrors of possible conflagrations, of which earthquakes are so fruitful a cause.

HIGH-PRESSURE FIRE PROTECTION.

The high-pressure fire protection system observes an American correspondent of the "Times," may conveniently be divided into two parts: the system of distribution, and the pumping stations. The pumping stations pump the water from the mains, or in case of emergency from the river, or both, forcing it into the mains of the distributing system, where it circulates under pressure, and whence it is delivered from the hydrant nozzles for fire extinction. At the present time the distributing system of New York extends from Twenty-third Street to Chambers Street, and from the Hudson River to Fourth Avenue, the Bowery and Park Row. This entire district is covered, with the exception of a few blocks in the north-west section between Seventeenth and Twenty-second Streets. The district protected includes approximately 1,456 acres, and comprises about 297,000ft., or 56 miles of mains, with 1,274 hydrants, 2,191 valves, or four at every inter-section, for sending the course of the water in any direction where an excess of normal may be required. It is to be understood that this entire installation is independent of the ordinary city water supply, and has no connection therewith save through the pumping stations. Various sizes of pipes for mains were used, from 8in. to 24in. in diameter, according to requirements of distance from the pumping stations; that is, a complete belt line of 24in. main surrounds the district upon, or a short distance within, its marginal streets; from this artery, lines of 20in. main extend, and so on. This system was laid, tested, and repaired as shown necessary under test, and re-tested, in 17 working months, or at an average rate of 700ft. per day. The daily rate sometimes reached 1,400ft. per day.

In the near future the system will be extended to cover the territory between its eastern limits and the East River, and as far north as Houston Street. An appropriation amounting to £360,000 has recently been voted for this purpose by the Board of Aldermen. This will substantially cover the region regarded as embracing the greatest fire risks.

Both of the pumping station buildings are of brick and steel fireproof constructon, on concrete foundations. Each station at present contains five multi-stage centrifugal pumps driven by induction motors. These were furnished by the Allis-Chalmers Co., Milwaukee, Wis., and space is provided in each station for the installation of three more similar units. The present capacity of the combined stations is 30,000 gallons per minute, delivered at a pressure of 300lb. per square inch at the hose nozzle. Each station building is 64ft. by 97ft., and consists of one storey and basement. The pumps are located along the sides of the building on the main floor. Each is capable of delivering 3,000 gallons per minute against a discharge pressure of 300lb. per square inch when running at 750 revolutions per minute. All internal parts are of bronze composition. The pumps are kept primed for instantaneous service, and by means of regulators and relief valves the discharge can be maintained at any pressure between 100lb. and 300lb. per square inch.



THE PASSAGE KAUFHAUS, BERLIN: AN ARCADE OF SHOPS CONSTRUCTED OF REINFORCED CONCRETE.

A BIG BUSINESS BUILDING IN BERLIN.

The Passage Kaufhaus, Berlin, which has been recently completed, offers some points of novel interest to architects and builders, as it appears to inaugurate a new method of business organisation, requiring special arrangements in the building. The Passage Kaufhaus represents an organisation of about sixty retail traders, who, associated under one roof, enjoy all the advantages of the wholesale stores, and yet are entirely independent of each other as regards selling goods and making profit. A central office, maintained at the general expense, undertakes the free delivery of sold articles, the collection of money, advertising, and other matters that can be conveniently centralised. It is a novel form of co-operation and intertrading. The public also benefit in various ways, for they enjoy all the advantages to be found in a big store, including the use of parlours, restaurants, reading room, and other conveniences.

The building has been erected on a site of 8,700 square meters, and, in order to make room for it, no less than seven city houses had to be purchased and pulled down, requiring an outlay of eight million marks, while the new building has cost a further 8½ million marks.

The building is situated only a few minutes from the most frequented railway station in the city, and its two fronts run along crowded streets, which are now connected by an arcade running through the building. The arcade, affording a much appreciated means of getting from the one street to the other, is, of course, a valuable means of attracting buyers. Reinforced concrete has been mainly used in the construction. Foundations, pillars, floors, and all roofs, including the large cupola (having a diameter of 30 metres and being 45m. high), are constructed of this material. The Berlin building department requires a guarantee that the plastering shall not fall off. In this building all the ceilings are without plaster, and are simply painted.

Along the Friedrichstrasse, which is probably the most important business street in Berlin, this store has a frontage of 57 metres; the other front, on the Oranienburgerstrasse, being 67 metres long. These two streets are connected by the arcade within the passage store, a glass-covered walk 13 meters wide and nearly 150 metres long. Both entrances are immense portals two storeys high. The arcade is not in a continuous straight line, but its two approaches form an angle in the centre, which is surmounted by a large cupola. Limestone and marble are chiefly used in addition to the reinforced concrete. Statues and ornaments of stone or bronze are encountered at every turn, and the majolica works belonging to the Emperor have furnished much material. A unique feature is that the store contains a railway station. The city of Berlin has an underground line from north to south, cutting through the central portion of Berlin, and upon request a station was provided underneath this store.

The arcade is lined with about sixty windows, representing each of the sixty retailers. Several doors lead from the arcade to the salesrooms on the ground-floor, while spacious stairways lead to the second floor. To reach the others, one can use the numerous stairways contained in the house itself or one of the 23 elevators. At certain intervals the arcade is spanned by bridges, some of them as high as the fifth floor. The stairways are made of artificial stone, with iron railings and rich ornamentation. The stairways within the salerooms are of steel and polished marble. In the building, ten staircases go through all the storeys outside the salerooms, while nine are within them. In addition, eleven elevators help to carry the public up and down, while for freight ten special lifts, varying in size, are provided, as well as six spiral shutes for smaller articles. The largest elevator occupies a floorspace of 30 square metres, and can lift 2,500 kilograms. It will be used for pianos, safes, motor-cars, etc. The doors separating the shaft from the floors are constructed in accordance with the latest official regulations.

The long line of salerooms is here and there interrupted by a large hall, each of these halls representing a different style. For instance, one is built like a Turkish chapel, and here Oriental rugs, etc., are sold; while a "Blue Salon" has the lower part of the walls covered with blue velvet, the "Yellow Salon" has pillars of Siena marble, and in the "Red Salon" the walls are fitted with mahogany panels to a height of 7½ metres, and there is also a mahogany gallery. In the rooms in which provisions are sold, walls and floors are of white tiles, and a system of pipes from the ice-machines in the cellar go through this floor, so that meat, cheese, butter, etc., can be kept fresh for many days during the hottest summer. In the cellar have been installed a vacuum apparatus for cleaning the whole building, several exhausters for the pneumatic cash system, the above-mentioned ice-machine, and a remarkable carrying arrangement for parcels. When a customer has bought anything, the parcel is thrown on the spiral shute, which has openings on each floor. It slides down and falls upon a continuously moving endless band in the cellar, which carries it to the central room beneath the cupola. Here the parcel falls upon a rotating table, around which several attendants are sitting. At last it arrives in front of the man having charge of the delivery to the district to which the goods are addressed, and he puts the package into a wagon, which delivers four times a day.

The first military church on Salisbury Plain has been opened at Tidworth. It is to be named St. Andrew's Scottish Church, and has been built under the direction of a War Office Advisory Committee.

* * *

A useful Calendar has been issued by "Concrete and Constructional Engineering." It has a series of notes or hints upon what to avoid in order to prevent errors in the making of concrete, called "Dont's on Concrete." These hints, however, serve not only as preventives, but form instruction as to what is necessary to make a good strong concrete.

* * *

"English Church Architecture" is a new volume by Mr. G. A. T. Middleton, A.R.I.B.A., in the "Library of First Principles" series that is being published by Mr. Francis Griffiths.

THE PASSAGE KAUFHAUS, BERLIN: VIEW SHOWING BRIDGES OVER THE ARCADE.

HARD WOODS AND FIRE RESISTANCE.

The question of the relative value of different timbers from the fire point of view has become a matter of some importance; for the purchase of oak, teak, jarrah, and karri, as allowed under the Building Act, is a somewhat expensive matter, and the London County Council now have power to sanction, at their discretion, certain other timbers as being fire-resisting.

A systematic series of tests on a small scale has been conducted in Germany with beech, oak being used for purposes of comparison. This series of tests has given rise to a certain amount of controversy in Germany, and as the matter is of equal importance in this country, we are publishing the report in full.

Laboratory tests no doubt are most valuable, up to a certain point, for the results as demonstrated in full-sized tests are sometimes very different from those obtained from small test pieces in a laboratory. Thus, 1-in. square sections of wood under test give, say, a comparative, but not a definite result as to what baulks of timber or heavy timber flooring will do.

The nearest approach to what different timbers will actually do in fire can be gleaned from the report of the British Fire Prevention Committee on the series of door tests which they are undertaking, where numerous doors of 2in. thickness of different timber have been under test. Similarly, their tests with sections of heavy warehouse floors, measuring 20ft. by 10ft., and conducted with various timbers, should serve as a practical guide. We, nevertheless, congratulate the German authorities on their having taken the matter up from the laboratory point of view, for there is no doubt that the results of these laboratory tests when read with the results of the full-size tests conducted in Great Britain, must together give a very clear summary of the relative value of different timbers from a fire point of view.

It will certainly soon be necessary to increase the present list of hard woods, or of woods permissible as fire resisting woods, and further investigation on the subject will thus be welcome. The report below is, we think, one of the most interesting of its kind.

Fire-Resistance of Beech and Oak

(A report prepared by Professor Hornberger and Mr. Sellheim, surveyor of woods and forests, on tests that were conducted in accordance with instructions of the Prussian Board of Agriculture, with the object of ascertaining the feasibility of allowing the use of beech instead of oak in the construction of wood staircases. As the particulars of the tests are likely to be of general interest, they are here given.)

The specimens in each case were:—

(a) Pieces of boards, 1m. long, cut on the square, the cross section being 1 sq. cm.; (b) stair treads 1m. long, 4cm. thick, and 4.8cm. wide.

Both woods had about the same amount of dampness in them, the oak having 18.03, the beech 15.41. Three series of tests were made.

Tests: Series A.

Two gas burners were used, and were allowed to burn until about equal temperature was obtained from both jets. A piece of the beech and a piece of the oak were then heated simultaneously by these burners. These pieces were placed in a horizontal position, and fixed in a frame at one end, but were loose at the other, the fire being applied 20cm. from the loose end, and the time being recorded when they had burnt through and broken; and, secondly, measurements were taken to see how far down in length the pieces had charred at the time the wood broke. In order further to make good any inequality in the heating power of both burners, one and the same burner was applied alternately under the beech and under the oak. The result was as shown in table I.

The beech broke sooner than the oak in nine cases out of sixteen. In the remaining seven cases, the oak broke before the beech. In section, the beech broke after 2½ min., the oak after 3 min. Excepting in two cases, charring took place to a greater extent with beech than with oak. In the first place, it was to the extent of 135mm.; in the latter case, to the extent of 100mm. In the burning off, the section of the beech at the burning point was lessened considerably more than in the case of the oak, which left a thicker charred part.

TABLE I.

The numbers of tests applied to the same piece of oak and beech wood are enclosed in brackets.

No.	Wood used.	Breaking Point.		Extent of the Charring.			
		Oak.	Beech.	Oak.		Beech	
		—	—	On the Fixed Side.	On the Loose Side.	On the Fixed Side.	On the Loose Side.

Tests: Series B.

It was equally important and difficult to find a method of obtaining data regarding the burning point of the two woods. After several preliminary trials, the following procedure was adopted. It was desired to ascertain how long it would take for beech and oak of equal form and equal section to catch fire, the same temperature being applied and the conditions of test being equal. The pieces of wood were laid in horizontal position, and in such a manner that the upper and under surface were also horizontal, and were fixed in the frame at one end, so that the pieces of wood to be compared (one beech and one oak), touched the burners at equal height. The burners were then fixed slantingly, by means of a solder, under the middle line of the beam, and just at the point to be heated, at least 15 to 20cm. from the end of the beam.

In order to obtain good times for testing purposes, a considerable distance would have had to be maintained between beam and burner, if the burner had been put on full flame—whereby some uncertainty would, however, have existed as to whether the intensity of heat applied to the two pieces of wood under test was absolutely the same in both cases. For this reason only a small flame was applied, which was constantly regulated and controlled by an inserted manometer, according to which the pressure was, as far as possible, the same all through the test.

As the results on the two objects under test (beech and oak) followed one another absolutely, and as each test only lasted a very short time, any difference of intensity could only have been very small. But any inequality might occasionally produce great differences in the single test, owing, perhaps, to differences in the construction of the wood at the particular point, or differences in the degree of dryness, or in the conductivity of the warmth of any inflammable gas in and around the wood, and so forth.

In Table II. will be found the times (given in minutes and seconds) which elapsed between the time when the gas-flame was applied to the woods and when the wood caught fire.

Although it will be observed that, at the commencement of the series, the oak caught fire first, this order was variable; and it will be found further down that sometimes it was the beech and sometimes the oak which started to burn first. Further, taken on the whole, the difference is but small, and the oak was at a slight disadvantage; for in 14 cases out of 26, the oak caught earlier than the beech in the earlier tests. Later, the oak caught in 10 cases out of 26; in 2 cases out of 26 both woods caught at the same time.

The mean time in which the beech caught fire was 2min. 26sec. The mean time in which the oak caught fire was 2min. 16sec.

TABLE II.

Time elapsed until the wood caught fire (Minutes and Seconds).

In the last 11 tests undertaken, it was endeavoured to ascertain how long it would take for the beam which had caught fire to continue to burn by itself if the flame of the burner were applied for 30secs. Furthermore, it was endeavoured to find out how far the charring (blacking, including browning at the edges) would extend along the length of the beam as a whole, after the wood flame had been extinguished.

The results of these tests are indicated in Table III. in two groups. Under *a* these tests are given where the oak commenced to burn earlier than the beech, and in *b* those tests were the oak commenced to burn later; or, at any rate, not earlier than the beech; whilst in Appendix *c* will be found the results of those tests undertaken on one and the same beam, results of tests which should be read together being put in brackets.

On the whole, the burning by itself took somewhat longer in the case of the beech than in that of the oak. In the beech it was 1min. 15secs.; in the oak it was 40secs. The greatest difference is found in the averages of the tests under *a*, where the beech caught later, and therefore had heat applied to it for a longer time than the oak. On the other hand, however, the number of cases where the beech continued to burn longer by itself than the oak is smaller than the number of cases where the reverse took place. The beech continued to burn longer by itself than the oak in four cases out of 11. Calculating the average length of time, it was found to be 140secs.

The beech burnt on for a shorter time than the oak in six cases out of 11, and the average of the shorter time was found to be 30secs. In one case they were equal, inasmuch as both woods continued to burn. Altogether the beech continued to burn by itself seven times in the 11 cases, the oak eight times.

The extent of charring after the extinction of the wood flame varied, on account of the difference of time in the application of heat and the time in which the woods burnt on by themselves, but taking the average, and also counting by cases, it was greater in the beech than in the oak.

The tests reported in table III. under *c* show that the results—continued at different points of the same beam—vary very little as compared with those taken on different beams. Taking an average, the following is what happened. On the first pair of beams (tests 20, 22, 24) the oak burnt sooner than the beech, but on an average the oak did not continue to burn by itself for as long a time as the beech, and the charring was less. In the case of the following pair of beams (tests 21, 23, 25), the average proved the reverse, and in the case of the third pair, the same took place as in the first.

We further found on examination of tests B and A:—(1) That in the wood employed here the oak proved more easily inflammable than the beech. (2) We find a greater number of cases where the oak continued to burn by itself and over a longer period than the beech. (3) We find that the average time where the oak continued to burn by itself is shorter in the case of the oak than in the beech. (4) On the average, the charring is less in the oak (B and A). (5) On the whole, it took longer for the flame to penetrate right through the oak than in the case of the beech (A).

It should not be forgotten, however, that the differences are generally only small, and that any deductions should be taken from the average thickness, whereas the single tests often gave just the opposite results. The differences are, perhaps, best explained if one considers the powers of conductivity of the two woods in the first place. In the case of the oak, this power is, on the whole,

PASSAGE KAUFHAUS, BERLIN: THE LIFT ENCLOSURES.

PASSAGE KAUFHAUS, BERLIN, STORES FOR THE SALE OF FOODSTUFFS.

less than in the beech, which was proved in the three series of tests with stair treads, where the volume by weight of the oak was a lower one. The heat applied to the beam by means of the burner would, in the case of the wood with the least conductivity (the oak), remain concentrated at the point where it was applied, and would thus, under equal circumstances, lead to an earlier lighting of the developed wood gases than in the case of the wood possessing the higher conductivity, where the heat applied would distribute itself over a greater volume of wood, and so the temperature at which inflammability is reached would only be attained after a longer period of time. This would mean that, once the point of inflammability is reached, and the application of heat is continued for a sufficiently long time (the half-minute allowed in the tests was, perhaps, not always sufficient), the formation of a greater fire surface in the case of the wood possessing the higher conductivity, and in consequence (putting aside the original heating point) had a longer and more extended burning by itself after the flame had been withdrawn.

The tests undertaken do not seem to show that any particular preference should be given to one wood over the other on account of danger from fire.

(To be Concluded.)

"MON'LITHCRETE": A NEW METHOD OF CONSTRUCTION.

Mr. Mark Fawcett, of the Fawcett Construction Co., Ltd., 50, Queen Anne's Gate, Westminster, has been for many years experimenting with a view to the better adaptation of girders for use in combination with concrete. The first idea that suggested itself was that used in this combination, some portions of the girder was superfluous. Mr. Fawcett therefore began by reducing the 3in. top flange to 2ins., thus reducing the original weight of 12lb. per foot to 10lb. per foot without loss of strength, the concrete taking one-third of the longitudinal compression. In testing these girders to breaking, it was found that in each case failure was caused, not by elongation of the bottom flange, but by the web buckling. These results suggested the idea of ascertaining what metal was superfluous in the web, and what could be done to prevent the buckling. Ultimately he decided to make large rhomboidal openings in the web, leaving tension bars pitched to the right and left of the centre at an angle of 45 degrees. The girder thus treated may be compared to a lattice girder with the compression bars removed; the concrete taking the vertical compression, while buckling is prevented when there is only tension metal in the web. The openings are continued not quite to each end, the web being kept solid at the bearing. In this way the weight is reduced to 7.3 lbs. per ft. as compared with the 12lbs. of the unmodified girder, but the strength is maintained and probably stability is increased by the provision against the expansion of concrete, which, passing through the openings in the webs, is held by the tension bars, and through them by the flanges. Small twisted bars can be passed through the web openings of paired girders. These bars, imbedded in the concrete about two-thirds down in the thickness, or below the axis, become tension bars longitudinally and vertically. This form of construction was tested, in the presence of a large number of architects and others, at the firm's works, Tunnel Avenue, East Greenwich, on Saturday last, as well as on Saturday week, the first test having left the slab intact, although it was loaded beyond the breaking weight (16.8 tons) of two 6in. by 3in. by 3in. by 12lbs. ordinary rolled steel joists. The subject of this test was a slab of 16ft. clear span, 2ft. 6ins. wide and 7½ins. thick, containing two 6in. by 3in. by 2in. mon'lithcrete girders, each weighing 7.3 lbs. per foot. At the point which had been reached when the test was adjourned, the deflection was not more than an inch, and only slight cracks had appeared on the lower surface of the concrete for which only five weeks had been allowed for setting. Destruction had not occurred with a load of 25 tons." The merits claimed for this system are: absolute safety, high fire-resistance, rapid construction, and low cost, and the experiments will be the subject of a further report.

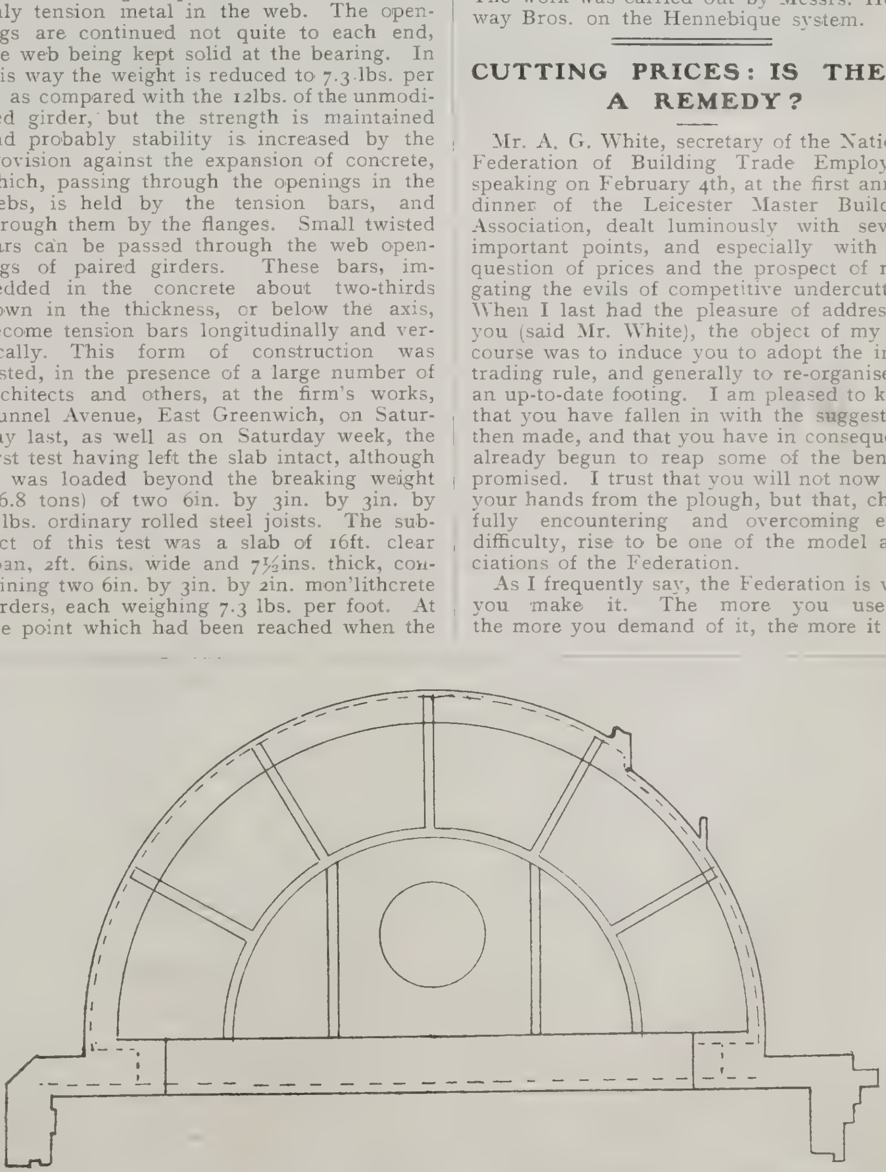
EXTENSIONS AT THE BOROUGH POLYTECHNIC.

The floors, columns, staircase, and roof of this building were constructed entirely in ferro-concrete, the chief feature being the roof, which is flat and of a span of 40ft., in the clear, and 32ft. above the floor immediately below same, the main beams being only 20ins. deep over all, including the 4ins. thickness of ferro-concrete roof. The roof is panelled, as is seen in the illustration, by means of secondary beams of the same depth as the main beams. The stage, which is semi-circular in plan, is also constructed in ferro-concrete, and has a roof over, which is conical in elevation. A special arrangement of girders was therefore necessitated, and a straight horizontal girder was provided to take the ends of a semi-circular horizontal girder, the latter being supported at intermediate points on three arched ribs as shown, two of these ribs being carried through the semi-circular girder to the straight one. Owing to the height of the roof, special scaffolding was necessitated. The work was carried out by Messrs. Holloway Bros. on the Hennebique system.

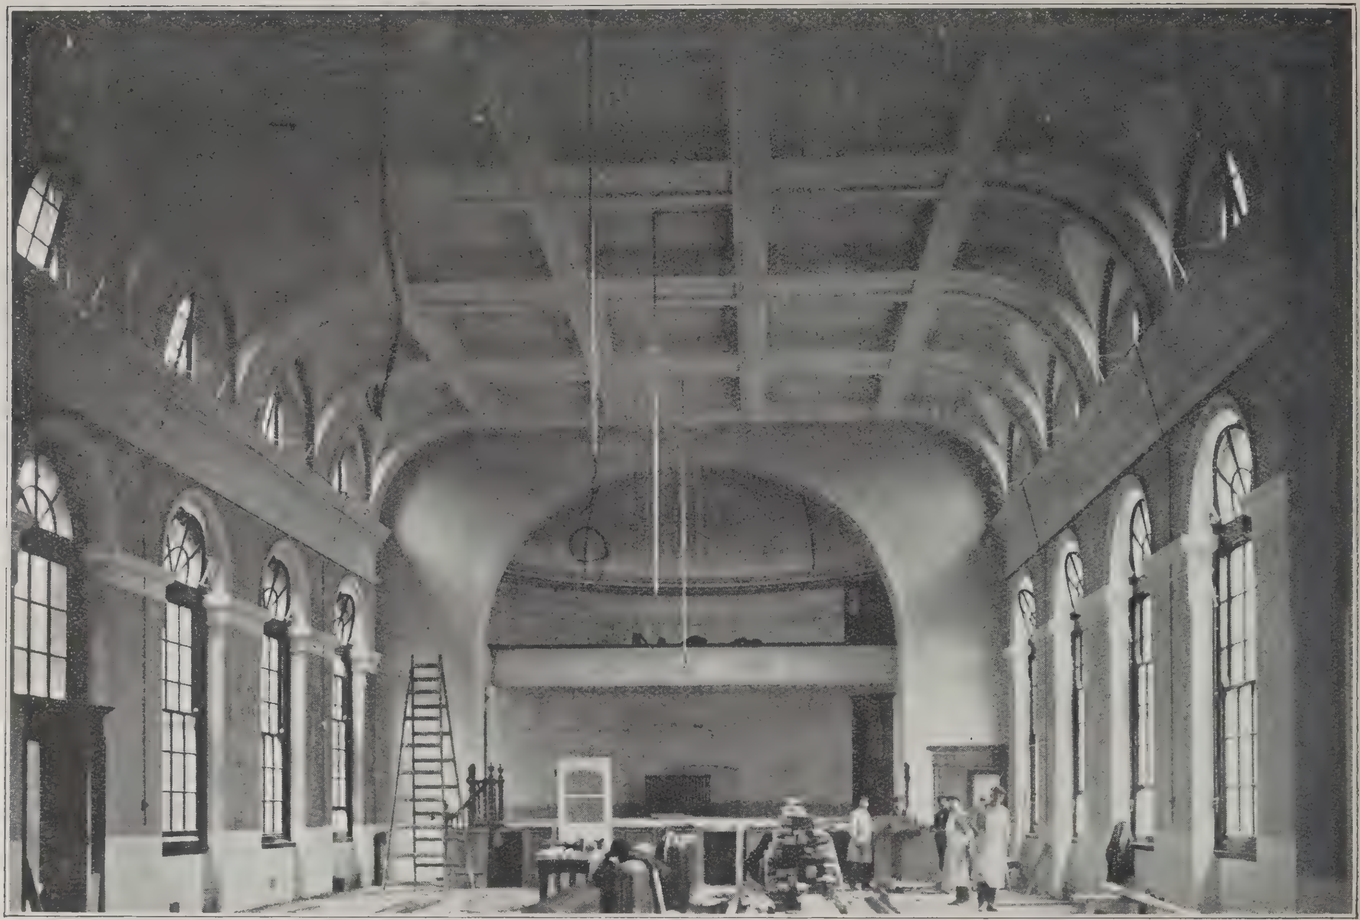
CUTTING PRICES: IS THERE A REMEDY?

Mr. A. G. White, secretary of the National Federation of Building Trade Employers, speaking on February 4th, at the first annual dinner of the Leicester Master Builders' Association, dealt luminously with several important points, and especially with the question of prices and the prospect of mitigating the evils of competitive undercutting. When I last had the pleasure of addressing you (said Mr. White), the object of my discourse was to induce you to adopt the inter-trading rule, and generally to re-organise on an up-to-date footing. I am pleased to know that you have fallen in with the suggestions then made, and that you have in consequence already begun to reap some of the benefits promised. I trust that you will not now take your hands from the plough, but that, cheerfully encountering and overcoming every difficulty, rise to be one of the model associations of the Federation.

As I frequently say, the Federation is what you make it. The more you use it, the more you demand of it, the more it will



EXTENSIONS AT THE BOROUGH POLYTECHNIC. DIAGRAM OF GIRDER ARRANGEMENT.



HALL IN THE BOROUGH POLYTECHNIC INSTITUTE. ROWLAND PLUMBE, ARCHITECT.
Reinforced Concrete. Holloway Bros. (London), Ltd.

respond to your desires. But please understand that the motive force must, broadly speaking, come from yourselves; the Federation is merely the instrument. It is your wishes, your support, your individual sacrifices in the cause of combination, which must direct that instrument.

I saw a quotation in a daily paper this morning which struck me as applicable to builders, although it was used in a national sense, because the greater includes the less, and what is true of the nation is true of the industries and individuals of a nation. The quotation ran: "For peoples, the right to live is measured by the sum of the individual sacrifices to which each nation is willing to consent." I think you will agree with me that a similar statement would be true of an industry such as ours. There was a time when this land of ours was the haunt of wild beasts and savages; it is now the home of a mighty nation. That progress has been due to combination, co-operation, and to the individual sacrifices to which our forefathers have been willing to consent to secure that co-operation.

It is in this spirit that we must continue if our industry is to be maintained and to flourish. In the main, competition is a good thing and a law of life; but since there is nothing perfect, it brings with it severities and oppressions which at times seem to stultify its benefits. This is Nature's way of improving her children—by putting pressure upon them to improve their methods, to extend and perfect their combinations so as to rectify the evils while retaining the good.

At the present time, these evils, I fear, rather tend to predominate, and many are seeking a remedy. This feeling came out rather unexpectedly at our annual meeting the other day, when Mr. Lever wanted to know whether something could not be done to put a stop to the excessive cutting of prices which prevails, and said he thought something might be done if we would but try. Mr. Lever was somewhat ironically invited to propound a scheme, while some said it was impossible, and some said: "Get all the builders to join first," and so on. Mr. Lever did not, however, make known to the meeting his full thoughts. I think he was a little disconcerted by the mood of the meeting; but in conversation later, I found that there was some sound sense in what he had in mind. He did not mean to suggest, as probably many thought, a trust or combine, to raise prices after the American style, but rather he wished to bring about a body of opinion or conviction as to what was and what was not a reasonable price for work in any given state of trade. He wished to create a general opinion throughout the trade that the cutting of prices is mostly unnecessary, and he thinks that, once such an opinion is general and strong, the trade will itself take action. He thinks that builders who hold aloof from us do so mainly because they do not see any tangible advantage to be gained by coming into an organisation which allows its members to cut one another's throats, as it were, in competing for work; also, that a good deal of the cutting is due to sheer ignorance of what is a fair price.

Now, I think that an illustration of what appears to take place in another industry may show us that Mr. Lever has some grounds for his belief. Take the coal trade, for example. At certain changes of season, or during severe climatic conditions, or other circumstances affecting the consumption or supply of coal, an announcement is made in various large centres that it has been decided to advance or reduce the price of coal so much per ton. What is the effect of such an announcement? Well! the consumer looks to his stock and estimates the probability of a further rise or fall, and decides on his judgment whether to buy at once or wait and chance it. The merchant presumably does the same, but in addition, he posts up the announced prices, or something very near them, because he knows that the public mind has been prepared by the announcement to pay such prices. In a word, a price has been, or prices have been, suggested to the public.

Sometimes the public judges that the rise is going to be followed by further rises, due to scarcity or other causes, and promptly rushes in to cover its shortage. Sometimes the public judges that prices have reached so low a level that it is wise to buy largely for stock. Whichever way it is, the point to note is the effect that a suggestion, authoritatively announced, has upon both the buyer and seller.

What, I take it, Mr. Lever wants to bring about, is something like that. I don't see any impossibility about achieving such a result—it is a matter of ingenuity and individual sacrifice. For example, suppose an investor is looking for a remunerative and safe investment. He can find out easily enough what are the prices of Consols, Bonds, railway, and other industrial stocks and shares; but what can he find out about land buildings? Very little, I imagine, and that with difficulty; and yet there is no more stable kind of investment. How is he to have advertised daily, or at short intervals, information as to what certain kinds of buildings can be built for, and what revenue they may be expected to yield? I know of no ready means of ascertaining this.

And yet there would be no difficulty for committees of experts, composed of builders, architects, and surveyors, to produce and publish information of this kind—information which would show that the price of buildings of a given class was so and so, and that the price as compared with previous reports was rising or falling, and that the rental values of such classes of buildings was about so and so, and rising or falling. Such information, it seems to me, would act and react on the minds of the public, and all the producers too in a somewhat similar way to what announced changes of price do in the coal trade.

I understand that Mr. Lever intends to have this matter further considered by his local association, and it will be interesting to hear the result. Perhaps you, too, will give this most important question your careful consideration.

Proposed New Works.

ABERDEEN.—The directors of the Royal Infirmary propose to spend Lord Mountstephen's gift of £26,758, received last May, in various alterations and extensions. These works comprise:—The erection of three operating theatres, with surgeon's room, anæsthetic and sterilising rooms to each; a new out-patients' department on Sim's Square; a reconstruction of the surgical block to provide an electrical department in the basement; improvements to the gynæcological and ophthalmic departments; and increased accommodation for the medical and nursing staffs.

BOURNEMOUTH.—The Town Council has passed plans for the following works:—Three houses and shops, corner Gervis Place and Westover Road, Messrs. Aldridge and Haydon; new exit, Boscombe Hippodrome, Messrs. Mouillott and De Frece; shop, corner Gervis Place and Westover Road, Messrs. Aldridge and Haydon; pair houses, Firbank Road, Mr. J. Flower; house, site 146, Grand Avenue, Mr. F. Cole; three houses, Castlemain Road, Mr. T. Cole; houses, 23, St. Anthony Road, Capt. MacDonald; house, 70, Fenton Road, Mr. W. H. Haysom; house, Belle Vue Road, Mr. W. Shave; house, 70, Muccleshell Road, Mr. W. Light; house, 5, St. Augustine's Road, Messrs. Jenkins and Sons; three houses, 47, 48, and 49, Madison Avenue, Messrs. Wallace Jones and Sons; house, 148, St. John's Road, Mr. R. B. Parkes; house, 71p, Easter Road, Mr. W. Warr; two houses, Lowther Road, Messrs. Davis and Lambert; two houses, Edge Hill Road, Mr. S. Harris; pair houses, corner Amesbury and Beaufort Roads, Mr. J. Francis; house, 8, Green Road, Mr. T. Cole; two houses, 330, and 331, Green Road, Mr. H. Snook; two houses, King's Park Avenue, Mr. G. Dolman; house, 28, Kimberley Road, Mr. F. Tilbury; house, 133, King's Park Avenue, Mr. G. W. Meadus; house, 20, Queen's Park South Drive, Mr. J. Flower; house, site, Lowther Road, Messrs. Miller and Sons; house, Stourcliff Avenue, Mr. A. Cook; house, 17, Foxholes Road, Mr. W. Bullen; two houses, Maxwell Road, Mr. A. T. Montague; two houses, The Avenue, Stourwood Estate, Mr. R. Holly; house, Muccleshell Road, Mr. J. Wilson; alterations, The Central Hotel, Richmond Hill, The Royal London Mutual Insurance Society, Ltd.; house, 31, Heathwood Road, Mr. F. Brewer; two houses, 48 and 49, Guildhill Road, Mr. S. Harris.

BRIDGE-OF-WEIR, SCOTLAND. — The parish church is to be extended at a cost of £1,100. About £820 of this is in hand.

COVENTRY.—The City Council has passed plans for the following:—Four houses, Oliver Street, for Mr. C. A. Newbold; rebuilding of factory, Lower Ford Street, for Mr. T. F. Jackson; eight houses, Marlborough Road, for Mr. C. Blockley; 27 houses, Chandos Street and Clements Street, for Mr. W. Wincott; one house, Chapel Lane, for Mr. E. Kelley; ten houses, Adderley Street, for Mr. T. Rogers; twelve houses, Northfield Road, for Mr. J. Cranston; two houses, Broomfield Road, for Mr. E. Twigg; hardening shop, Mile Lane, for the Swift Motor Co., Ltd.; 28 houses, Broomfield Road, for Mr. E. Twigg; seventeen houses, Carmelite Road, for Mr. J. Gardner; thirteen houses, Walsgrave Road, for Messrs. Brookfield and Stratton's factory, White Friars Street, for Mr. D. Payne

DUNDEE.—The Dundee Library Management Committee are considering the plans prepared by Mr. Thomson for the proposed central reading-room at the corner of Barrack Street and Ward Road.

EASTLEIGH, HANTS.—The Hants County Council have agreed to erect a new school at Derby Road, Eastleigh, to cost £11,169.

ELLAND, YORKSHIRE.—It is proposed to erect a new secondary school here, and the County Council are applying to the L.G. Board for a loan for this purpose. The Halifax Architectural Society have offered assistance in drawing up conditions for a competition.

GIRVAN, SCOTLAND.—Mr. John M'Master, of Canterbury, has offered to erect a new Town Hall here, his native town. Plans have been prepared by Mr. W. J. Jennings, of Canterbury, for a building of three floors, the basement containing cloakrooms, kitchen, etc., on the ground floor a police court, committee rooms, and a small hall to seat 246 people, while on the first floor will be the council chamber and principal hall, the latter accommodating between 750 and 1,000 people. The building will be of stone in Early Renaissance style. Mr. M'Masters' offer has been accepted by the ratepayers and the Council has provided the site.

GRIMSBY.—The Finance Committee of the Corporation have approved a Town Hall extension scheme to cost about £30,000. The plans provide for the erection of police, admiralty, arbitration, county, and coroner's courts, and new suites of offices for all the corporate departments, as well as an art gallery and an assembly hall, capable of holding nearly 3,000 people.

HALIFAX.—The new church of St. Paul, King Cross, will cost £14,000 or £15,000. Towards this there is a sum of £4,500 in hand, but other donations or bequests already promised will bring the fund up to £10,000.

HASTINGS.—The Town Council has passed plans for the following works:—New store at the Tramway Power Station, Parker Road, The Hastings Tramway Company; new slaughter-house at Brickyard, near Sedlescombe Road North, Mr. John Whatman, owner, per Mr. Henry Ransom; two dwelling houses, Hurrell Road, Mr. A. H. Cramp, owner and builder; additions at "Harold Laundry," 309, Harold Road, Mr. A. E. King, owner, Mr. A. Midmer, builder.

HERNE BAY—The U.D. Council have passed plans for the following:—Motor garage, King's Road, for Mr. Victor Roi; house, Western Esplanade, on plots 1045 and 1046, for Mr. A. Mann Hawkes; and a house on King's Road for Mr. Joseph Rowden.

INVERARY.—The Town Council are considering the repair and extension of the stone pier at a cost of over £6,000. A structural engineer is to be consulted as to the preparation of plans and specification.

NICE.—A monument to the late Queen Victoria is to be erected on the Boulevard de Cimiez. Mdme. Raynaud, the owner of the villa at which the late Queen used to reside, has given the ground; the Municipality have voted £800, and public subscription has furnished a further sum of £1,000.

OSWALDTHISTLE, YORKSHIRE.—New Primitive Methodist schools are to be built here, and funds are being collected for the purpose.

PERTH.—The directors of the infirmary have secured a site for the new buildings at Tullylumb. It is proposed to spend £40,000 on the new infirmary, which is to contain 100 beds, and of this sum about £10,400 is still required.

POOLE.—The Town Council has passed plans for the following works:—C. Goater, for C. R. Welch, house, Spur Hill Avenue; W. E. Greenham, pair of semi-detached houses, Sunnyside Road; Blachford Bros., for Mrs. Reeves, house in Birchwood Road, Parkstone; Jones and Seward, two detached houses, Princess Road; W. T. Cross, house, Sandbanks Road; W. Southgate, dwelling house, The Avenue, Branksome Park; H. F. T. Barnes, for Burt and Vick, three shops, High Street, Longfleet; Charles T. Miles, for Miss Rudd, house, Canford Cliffs.

PORTSLADE, SUSSEX.—The local authority is considering the question of erecting a town hall and fire brigade headquarters.

RICHMOND.—The L.G. Board has held an inquiry into the application of the Richmond Corporation for leave to borrow £7,300 for the extension of the municipal buildings.

SANDRINGHAM.—The royal residence here is to be enlarged by the addition of a storey to one of the wings, the increased number of guests whom their majesties command to Sandringham having led to increased requirements for sleeping accommodation.

SHEFFIELD: WOODSEATS.—A new Baptist church is to be erected here, of which the school buildings are to be erected first. The latter will contain a lecture hall to seat 450 people, and the estimated cost is £1,500.

SUNDERLAND.—The Corporation Building Committee has approved of plans for the following work:—Hugh Hedley for Stephen Stonley, three houses, Markham Street and Balmoral Terrace; Joseph Potts and Sons for W. H. Swan, four houses, Cooper Street; Joseph Carter, house, Beechwood Street; Geo. T. Brown, additions to the Infirmary by enlarging the outpatients' building.

SWANSEA.—The L.G. Board have sanctioned the building of ten houses in Llangyfelach Road, and have advised the Corporation to invite tenders for their construction with concrete blocks, with alternative prices for brickwork. Since the Board's sanction of the concrete block cottages, a new regulation has been issued requiring 10in. blocks, and under these circumstances it is possible that brick walls would be as cheap as the concrete blocks.

TENTERDEN, KENT.—The Town Council are considering the erection of a new town hall at a cost of about £1,500.

TIBSHELF, DERBYSHIRE. — The parish church is to be extended at an estimated cost of £2,500. Mr. H. P. Currey, of Derby, is the architect entrusted with the plans.

TYSELEY, NEAR BIRMINGHAM.—A new Primitive Methodist church, Sunday schools, and institute, are to be built here at a cost of £8,000.

WIGAN.—Public notice has been given of the intention of the educational authority to erect a school on the site in Scot Lane, Newtown.

WINCHESTER.—The Hants County Council are about to erect new additional offices on the site of No. 2, St. James's Street, at a cost not exceeding £18,000.

WREXHAM.—The Vicar of Wrexham, the Rev. D. Davies, announces that a generous churchman, who does not wish his name to be divulged, has offered to build a new church at Hightown, one of the populous suburbs of the borough, at his own expense. The vicar appeals to the general body of the church people of Wrexham for £3,000 for other church purposes, including the erection of a school church in the Smithfield district, another populous part of the borough, during the present year.

Works in Progress and Completed.

ABERYSTWYTH.—Eighteen workmen's cottages are being erected by the corporation in Skinner Street and Poplar Row at a cost of £2,300.

AYR.—The reparation of the Auld Brig is proceeding gradually. Mr. W. S. Wilson, the engineer, states that the work has been retarded by floods, but no damage has resulted to the structure. The north and south abutments are being underpinned, and three of the arches have been grouted up. Mr. James A. Morris, the architect, states that the reparation of the surface stonework is proceeding satisfactorily. The expenditure to date is £6,500.

BEAFORD, DEVON.—A new tower for the Parish Church is being erected at a cost of £550, and a new vestry is also being added at the east end. Mr. Harbottle Reed, of Exeter, is the architect, and the builders are Messrs. Squires and Son, of Roborough.

BLACKWELL, DARLINGTON.—A new United Methodist Church is being erected here at a cost of £4,500.

DUMBRECK, SCOTLAND.—The new Steven Memorial Church, to seat 750, has been erected at a cost of £6,000. Mr. W. F. M'Gibbon, F.R.I.B.A., of Glasgow, is the architect.

LONDON, E.C.—The memorial to the late Sir W. H. Russell, the famous war correspondent, in the crypt of St. Paul's Cathedral, was unveiled on the 9th inst. The memorial, which consists of bust in bronze surmounting a tablet with inscription, is the work of Mr. Bertram Mackennal, A.R.A.

LUTON.—The opening ceremony of Wellington Street Baptist Schools and Institute took place on Wednesday, the 10th inst. The contract has been carried out by Messrs. T. and E. Neville, of 30, Castle Street, Luton, and amounted to £5,000. The architects are Messrs. George Baines and Son, 5, Clements Inn, Strand, London, W.C.

MACCLESFIELD.—A new high school for girls has been erected here by the Cheshire County Council. The building, which will accommodate 250 scholars, has cost more than £14,000.

MALLAIG, SCOTLAND.—A new Carnegie reading room and library is being erected here. Tenders were accepted from Mr. D. MacColl, Fort William (mason), Mr. A. Maclean, Mallaig (joiner, carpenter, glazier, and painter work), Mr. Frazer, Fort William (slater work).

MANCHESTER.—A new branch mission-room (to be known as the Joynson Memorial), is being erected in connection with St. Phillip's Church, Bradford Road. The church, which will seat about 400 people, will cost about £1,650. Messrs. Potts, Son and Hennings, of Manchester, are the architects.

MOSELEY, BIRMINGHAM.—The reparation of the Parish Church, under the supervision of Messrs. J. Chatwin and Sons, is to be commenced immediately. The tender of Messrs. Godfrey and Collins, amounting to £6,782, has been accepted.

NEWPORT, MON.—A start has been made upon the borough technical schools in Clarence Place. Mr. W. E. Blake is the contractor. The Great Western Railway extensions and improvements are proceeding. The blasting operations in connection with the new tunnel works now resemble a daily bombardment. The company has in contemplation the erection of a large new bridge over the River Usk in connection with the projected new station, which is badly needed. Many hundreds of new houses are being erected in the western valleys of Monmouthshire in anticipation of the demand for houses occasioned by the sinking of new collieries in this district. The new Savoy Hotel and Restaurant at Newport is approaching completion, and is regarded, locally, as equal to anything in London. The keynote is stated to be durability, both inside and outside. Mr. William Gardner is the architect, and Councillor W. A. Linton is the contractor.

OLDHAM.—A triptych with paintings upon oak panels in the sanctuary of St. Mary's Church, Oldham, was dedicated last week. The subject of the paintings is taken from the 1st chapter Revelations, and represents "Our Lord seated upon a throne of gold, in the midst of seven golden candlesticks, and having seven stars in his right hand." On either side are kneeling figures of the Virgin Mary and St. John Baptist; the four archangels, with a host of angels playing musical instruments surround the Throne. Below are groups of figures representative of the church's history, from the Old Testament prophets down to more recent times, and include many authentic portraits, among whom are Archbishop Laud, Bishop Andrews, Lightfoot, and Patterson, with Doctors Pusey and Keble. The paintings, which contain upwards of seventy figures, are by Mr. E. Stanley Watkins, of Ealing.

ROSYTH, SCOTLAND.—Messrs. Gibb, Easton, and Co., who have secured the contract for the new naval base, will commence work immediately. The contract amounts to about £3,250,000, and will occupy about seven years.

SCARBOROUGH.—It is proposed to convert the Salisbury Hotel into a music hall to seat 2,077. The new place of amusement, which is to be on a palatial scale, is to be ready for opening about the first week in August.

SOUTHGATE, MIDDLESEX. — The County Council has accepted a tender for £13,493, for the erection of a county school here.

SOUTHPORT.—The ratepayers and the Town Council are discussing the proposed erection of a public hall to seat 4,000 people. Various schemes embodying a market, concert hall, roof garden, shops, and other attractions have been mooted.

STANLEY, WAKEFIELD.—A new elementary school has been opened here. It provides accommodation for 420 children, has cost £4,336, inclusive of £327 for the site; and has been erected from the designs of Mr. J. Lane Fox, of Leeds and Dewsbury.

SUMMERTON, IBROX.—A new public school has been opened here. The buildings of red sandstone, include ten classrooms, two central halls (one for mentally and one for physically defective scholars), a dining hall, kitchen, rooms for teaching household management, and rooms for teachers, the doctor, and a nurse. A committee room for ladies, and a laundry in the basement are also provided. Mr. Preston, master of works to the Govan School Board, was the architect; Mr. John Baird the measurer; and Mr. John Rodie the clerk of the works. The cost of the buildings was £11,600.

SWANSEA.—Extensive works for Messrs. Baldwin and Co., Ltd., tinplate steel workers, etc., will be commenced immediately. The cost of the new works and blast furnaces is estimated to be about £200,000.

WAKEFIELD.—A new provided school has been opened at Stanley Grove. The buildings have cost £4,440, and comprise a central hall 62ft. 6in. by 26ft., with four classrooms, giving accommodation for 240 children. Space is allowed for three further classrooms, bringing up the accommodation to 420; the central hall, cloakrooms, etc., having been built on a scale commensurate with the complete scheme.

TESTS WITH FIRE-RESISTING DOORS.

Since our previous issue of the fire section the British Fire Prevention Committee has been undertaking two tests with doors to large 7ft. openings, one test being with an "armoured" wood door, and the other with a roller shutter door of American origin. Both tests were for a duration of 2½ hours, at temperatures reaching above 1,800 degrees Fahr., and were followed by the application of water from a steam fire engine. Official reports will be shortly issued in respect to these tests. We are informed that a number of doors will be before the committee for investigation this month, amongst them being two further "armoured" doors, two metal doors, two composite doors, and some rolling shutter doors; in fact, the number of doors and shutters put forward for investigation at the moment is quite considerable, the subject being of immediate practical interest, having regard to the necessity of having reliable data in respect to doors intended to close large openings in buildings of great cubical extent. The tests with doors have been heretofore conducted in one of the committee's testing chambers only, but since November two chambers have been in operation, and we now understand that a third testing chamber is to be adapted for door tests to meet with the pressing requirements regarding this class of investigation.

It is understood that a table, giving the precise facts summarised from the official reports, is to be issued; and as the investigations already include about forty doors, this summary of the work should be a valuable guide to this class of work.

Federation News.

SOUTH SHIELDS ASSOCIATION.

Secretary: J. G. Robertson.

The South Shields branch followed up most energetically the remarks of the Official Receiver (Mr. T. Gourlay), with respect to forms of contract that he made in the Newcastle Bankruptcy Court. (See "Builders' Journal," p. 48, January 20th.) Special attention has been given to the matter in the local Press. The difficulties that contractors have had to contend with have, as a result of the publicity given to the matter, been brought home to the public as never before.

BIRMINGHAM ASSOCIATION.

Secretary: E. J. Bigwood, J.P.

A meeting of the committee of the Birmingham Building Trades Employers' Association was held at 17 and 19, Colmore Row, Birmingham, on Monday, January 18th, at 2.45 p.m., Mr. F. G. Whittall (president) being in the chair. There were thirteen other members present.

The proposed new rules of the association, as drafted by the sub-committee, were considered, and with a few alterations were approved for presentation to a general meeting.

The attention of the committee was drawn to the terms of an advertisement now appearing with reference to tenders for the erection of the Rednal reading-room by the King's Norton District Council. The advertisement required a deposit of one guinea, which would be returned on receipt of a bona-fide tender, and all documents issued to the contractor. The secretary was instructed to write to the surveyor to the council pointing out that this requirement was unusual, and that the committee of this association took the strongest objection to it, and hoped that the council would see their way to omit it.

The conciliation boards were appointed to meet the various branches of the operatives to discuss the proposed alterations to the working rules.

A report from Mr. A. G. White (the secretary of the National Federation) on the second annual return of members was read and received.

The president and Mr. J. B. Whitehouse were asked to represent this association at the annual meeting of the National Federation.

Two new members were elected, viz., Mr. F. H. Smith, 418-420, Moseley Road, and Messrs. Richard S. Moore and Co., Green Street.

The general meeting of members was held at the Building Trades' Exchange, Cannon Street, on Thursday, January 28th, Mr. F. G. Whittall presiding. There was a good attendance. The new rules were approved and ordered to be printed and circulated among the members. These rules include the inter-trading rule, which was adopted at the annual meeting in November last. The business closed with a vote of thanks to the Building Trades' Exchange for the use of the room for the meeting.

BROMSGROVE AND DISTRICT ASSOCIATION.

Secretary: Sydney J. Brazier.

The annual meeting of the Bromsgrove and District Association was held on Saturday, January 16th, Mr. Wm. Weaver presiding, with Mr. D. Edwards in the vice-chair.

The secretary read a report of the work of the association during the past year, and presented a statement of accounts; both were unanimously adopted. The report showed a membership of 18, as against 17 at the corresponding period of last year. The statement of account showed a satisfactory financial condition. It was decided to hold the annual dinner, the arrangements for which were left in the hands of a committee.

Mr. D. Edwards was elected president, and Mr. W. J. Tilt vice-president. Votes of thanks were passed to the retiring president and vice-president, and were acknowledged in suitable terms. The treasurer and secretary were re-elected, and votes of thanks accorded them for their services in the past. Two new members were elected. Six orders for the "Builders' Journal" were received.

The first meeting of the recently formed local conciliation board was held on the same evening.

LEICESTER ASSOCIATION.

Secretary: S. A. Dove.

The annual report on the work of the Leicester association records that the stonemasons, plasterers, and plumbers have merged their own associations into that of the master builders to form one powerful organisation. The committee regret they were not successful in carrying their appeal against the operatives' definition of the working rules in respect of the five-mile radius. They persevered at the local conciliation board and the Midland centre, but the verdict was against them at the National conciliation meeting. At the termination of the five years' agreement affecting the boundaries, namely, twelve months hence, the whole question must be effectively dealt with.

New rules governing this association will be taken in hand and completed by the new committee. They are in an advanced state, but have been kept back to wait for the meeting of the National Association.

The attention of the members is called to the advantages of the collective insurance scheme which the Midland Federation has been at considerable trouble in formulating.

The annual general meeting of the Leicester Association was held at the Saracen's Head Hotel, Leicester, on February 4th, when a large number of members attended. All the officers were re-elected as follows:—President, Mr. W. Yates; vice-presidents, Messrs. F Beck and G. Rimmington; hon treasurer, Mr. A. Chambers; secretary, Mr. S. A. Dove, F.C.R.A., Spencer Chambers, Market Place, Leicester; and six representatives, each of bricklayers, carpenters, plumbers, stonemasons, slaters, and plasterers, forming the general council.

The annual report draws attention to the changes in the constitution of the association since the last annual meeting of the Leicester Master Builders' Association. At that time a hope was expressed of a closer connection with the allied trades by means of an affiliation scheme. This hope has now been realised, but in a somewhat different manner from what was foreshadowed. The stonemasons, plasterers, and plumbers have merged their own associations into that of the master builders, to form one powerful organisation. This, conducted with wisdom and care by the officers and committee, and loyally and faithfully supported by the members themselves, should be of great benefit to the trade, and generally tend towards establishing that position and prestige to which such an important industry is entitled.

After the annual report and accounts had been passed, the secretary called the attention of the members present to a minute that was passed on November 11th referring to the question of honorary members, and the preparation of a telephone card on similar lines to other large associations.

Mr. A. G. White, secretary to the National Federation, who was present at the meeting, also emphasised the importance of this, and after a short discussion, it was unanimously resolved that the association do elect honorary members; and a small committee was appointed to publish the telephone card (which is similar to that of Liverpool Association), as early as possible. Votes of thanks to the president and officers concluded the meeting.

The first annual dinner was then held. It proved highly successful, upwards of sixty members attending. Mr. Hassell, president of the Leicester Master Painters Association, Mr. A. G. White (National Federation), Councillor H. Smith, and Mr. F. W. Amphlet (Midland Centre), and Mr. Elder-Duncan (editor "Builders' Journal"), were also present. After the loyal toast had been honoured by the chairman, the toast of the National Federation was replied to by the secretary, Mr. A. G. White, whose important speech appears in another part of the present issue. Mr. Elder-Duncan, in replying to the toast of the "Builders' Journal," thanked all those members who were supporting the Journal. It had been a big undertaking, and had involved a large amount of hard work. The more the members supported it, the better it would become. He referred to complaints of the monthly reports being in small type, and said it was proposed to change the type immediately to that used for the rest of the paper. It was also decided to devote special attention to all departments of the building trade, so as to make it thoroughly a "Builders' Journal." Councillor H. Smith, president to the Midland Centre, replied to the toast of "The Midland Centre." Mr. Amphlet, secretary to the Midland Centre, proposed the toast of the evening, "The Leicester and District Building Trades Employers' Association," and expressed his pleasure at seeing this association progressing so favourably and under such good management. "The Visitors" was replied to by Mr. Hassell, president of the Leicester Master Painters' Association.

BRISTOL ASSOCIATION.

Secretary: A. J. Pitt.

The annual meeting of the Bristol Association was held at the offices, Guildhall, Small Street, on Thursday, January 28th, when Mr. F. Chown, vice-president (in the absence of the president, Mr. Frank N. Cowlin, who is at present in Jamaica) presided.

The anual report, of which the following is an abstract, was presented, and, upon the motion of the chairman, seconded by Mr. W. Foster, was approved and ordered to be printed and circulated amongst the members:—

In the case of the contracts which have been let, it is a matter for regret that, in consequence of the very keen competition, prices have been far from remunerative. Indeed, it may be said in more than one instance that it has only meant that the contractor has been able to keep his machinery and plant employed.

Representations having been made by the Plasterers' Society asking that the fixing of substitutes for plastering might be recognised as plasterers' work, seeing that it was taking the place, to a great extent, of lath and plaster, a conference was held between the committee of the association and representatives of the society, when, after hearing the opinion of the men, the masters upheld their views, and it was resolved to add to the plasterers' schedule of work:—"Plastering in any material or any substitute for plastering, including lathing and all works in connection therewith."

The fair-wages clause in the corporation form of contract was the subject of negotiations between the association and the corporation, and the matter was settled as reported on p. 468 of our issue of December 9th, 1908.

The efforts made by the educational authorities of this city to secure a university for Bristol, will, it is to be hoped, in the near future be crowned with success, and, with a view to rendering all the support possible, the committee passed a resolution strongly endorsing the scheme, and this has been lodged with the authorities in whose hands the granting of the charter rests.

The question of floor and wall tiles was raised early in the year by the bricklayers' society, who desired that this work might be recognised as bricklayers' work, but to this the association took exception, as this had always been done either by plasterers or bricklayers, whichever happened to be most convenient to the builder. Eventually it was agreed between all parties to allow the fixing of wall and floor tiles to remain optional.

It is noted that arrangements have been made during the year by the National Federation with the proprietors of the "Builders' Journal," whereby that publication has become the official organ of the Federation, and the committee express the hope that every member of the association will support this movement and assist in making the journal a complete success, and of benefit to the Federation.

The association deplore the loss by death of three members during the year, viz., Mr. H. A. Forse, Mr. William Church, and Mr. T. Broad, all of whom, during their lifetime took an active interest in the work of the association.

Mr. George Humphreys, hon. treasurer, submitted his accounts for the past year, which were approved and adopted, upon the proposition of Mr. E. I. Neale, seconded by Mr. G. L. Poole, the former remarking that, in his opinion, the financial position of the association was most satisfactory, considering the exceptional depression through which the building trade was then passing.

Mr. Frank N. Cowlin was re-elected president, Mr. F. Chown vice-president, and Mr. George Humphreys hon. treasurer.

Upon a ballot being taken, the following were declared to constitute the committee for the coming year:—Messrs. E. I. Neale, J. Lovell, W. Foster, E. Walters, R. F. Ridd, A. Dowling, A. Perkins, and F. A. R. Woodward.

It was decided to defer the annual banquet of the association until March, in order that the president might be with them, and to leave the various arrangements in the hands of the committee.

A discussion upon general matters appertaining to the trade, closed the meeting.

BATH ASSOCIATION.

Secretary: E. J. B. Mercer.

The last general meeting, in November last, was adjourned until December 16th, in the hope that the president, Mr. J. W. Knight, J.P., Mayor of Bath (who has been laid up with a severe illness), might be able to attend. Although he is happily much better, he was not well enough to attend the adjourned meeting, at which Mr. Councillor A. W. Wills was voted to the chair. A letter from the Town Clerk was read to the effect that the various Corporation Committees had adopted the recommendation of this Association for the shortening of working hours during the winter months.

Names of representative delegates from the bricklayers', masons' and carpenters' and joiners union to serve on the local conciliation board were received. A small dispute in the painting trade was reported as being amicably settled.

A slight alteration of rules, to enable meetings to be held prior to the meetings of the Federation, was agreed to.

This concluded the business of the adjourned meeting.

The annual general meeting of the Bath Association was held at the conclusion of the business transacted at the adjourned meeting. In the absence of the president, Mr. Councillor Wills was voted to the chair. The minutes of the last annual meeting were read and confiermed.

The five retiring members to serve on the Executive Committee of the South Wales Federation, viz., Messrs. Ambrose, Blackmore, Erwood, G. J. Long, and Geo. Hayward, were re-elected.

The hon. treasurer presented a rough statement of accounts previous to auditing, which were considered satisfactory.

By the unanimous vote of those present, Mr. Frank B. Parsons (of Howard, Sons, and Parsons, Ltd), vice-president, was elected president for this year, upon which he was inducted in the chair and invested with the gold badge of his office.

Mr. George Hayward (Hayward and Wooster), president of the South-Western

Federation, was then elected vice-president. Mr. Councillor Sydenham and Mr. Edw. J. B. Mercer were then re-elected as hon. treasurer and secretary respectively, the latter for the 20th time.

A hearty vote of thanks was accorded to the retiring president for his services during the past year, with best wishes for his speedy restoration to health.

On a ballot for the committee, Messrs. F. Chancellor, S. Ambrose, W. Morris, and H. Knight were elected.

The auditors were re-elected.

The question of the annual dinner, which has been held for seventeen years, was then considered, and it was resolved that, in consequence of the depression in the building trade and the general distress amongst the working classes, this function should remain in abeyance for the present year.

MIDDLESBROUGH ASSOCIATION.

Secretary: Walter Rigby.

The monthly general meeting of the Middlesbrough Association was held in the Grand Hotel, on Wednesday evening, January 20th. The president (Mr. W. Masters) presided over a record attendance.

It was unanimously decided that the president attend the National Federation meetings as representing this association.

The motion to rescind a previous resolution of the Federation, prohibiting the sale of the National form of contract agreement to non-federated builders, was heartily approved. It was strongly expressed that an increased use of this agreement by all builders, whether federated or not, would be of great benefit to the Federation and the building trade generally. A very interesting report from the National secretary in reference to the annual return of members, and the very small proportion of apprentices to the number of men employed in the building trades, was read. It was felt that this return of members had served a very useful purpose in calling the attention of builders generally to the position of the trades in reference to apprentices.

The Vice-President (Mr. W. S. Davison) called attention to the special terms to subscribers to the journal through an association, and spoke highly of the value of the paper—educationally and generally—to builders. Other members followed, and several new subscribers were obtained. It was also decided that the secretary be provided with a weekly copy at the expense of the association.

In connection with this association, a smoking concert was held at the close of the general meeting, the president occupying the chair.

SUNDERLAND AND DISTRICT CONCILIATION BOARD FOR THE BUILDING TRADES.

A meeting of the Sunderland and District Conciliation Board for the Building Trades was held at Sunderland on Wednesday, January 20th, at eight o'clock in the evening.

Arising out of the minutes of the annual meeting, held on July 16th, 1908, was a matter with respect to bringing in the trades who were not represented upon the Board. It was explained that this had received the attention of the National Board quite recently, and efforts had been made to get the other trades to join. With the exception of the labourers' organisation, which was too complicated to be admitted, they were unwilling to join. The local Conciliation Board was therefore powerless to move in the matter.

The chairman (Councillor George Swan) called upon the operative stonemasons to state the complaint which had caused the Conciliation Board to be called together. Mr. W. Williams (London), the assistant general secretary of the Operative Stonemasons' Society, stated that two members of the employers' association had been importing dressed stone into the district governed by the working rules, in direct violation of Rule 5, which reads as follows:—"That no worked stone be allowed to come into the town or vicinity except tooled paving, landings, and steps, imported stone sawn on two sides, water tabling sawn on four sides, balusters and finial not exceeding seven inches in diameter be allowed." He said that if the employers desired an alteration of the rule, proper notice should be given.

In reply, Mr. J. W. White stated that at the present time very keen competition existed between the local master stonemasons and the quarries. Local contractors, in order to secure contracts, had in these instances accepted the quarry prices, which had resulted in the breach of rule complained of. There was no desire on the part of the employers to have the rule altered, as they wished to keep the work in the town as much as possible. The Conciliation Board should say definitely that all the trades, in a case of a violation of the working rules, should co-operate in securing that the rule be carried out. Owing to the fact that no local stonemasons were on the jobs referred to, the stonemasons were not in a position to force observance of the rule.

Mr. R. Baxter stated that they had no wish to penalise the employers, who had been led into a breach of the rule by force of circumstances, but they required a definite assurance that the rules would be observed, and that the trades represented were prepared to give the employers every assistance possible to carry them out.

After considerable discussion, in which many of the members present took part, on the proposition of Mr. W. Williams, seconded by Mr. F. W. Ranken, it was resolved and carried unanimously:—"That in view of the recent breach of Rule 5 of the stonemasons' working rules, and the joint request of the employers and operative stonemasons for an assurance of the trades represented on the Conciliation Board, in the desirable course of maintaining the working rules of the various trades, undertake to obtain from their respective societies such assurance of support of all trades in enforcing observance of the trade working rules, and the employers also give the same pledge to the various trades to enforce them."

Arising out of the resolution, a discussion took place on the fair wages clause in public contracts, which should include the observance of the working rules of the various trades in the district. After further discussion, on the proposition of Mr. J. W. White, seconded by Mr. R. Johnson, it was resolved:—"That joint representation should be made to the public authorities, by both the employers and the operatives, to have a clause inserted in the contract for the due observance of the working rules in force within the district."

Trade and Craft.

The "Cable" System of Heating.

The system of low-pressure hot-water heating invented by Mr. A. H. Barker, B.A., B.Sc., etc., is fully described in a booklet that has been issued by J. F. Phillips and Son, heating engineers, Richmond Buildings, Brighton, and 21, Old Queen Street, Westminster. The apparatus required for this system is known as the "thermo-syphoniser," which automatically heats the water, and powerfully circulates it in any required direction, independently of levels or gradients. As the pipes can be fixed at any level, and bent in any direction, it is obvious that no excavation is required either for pipes or for boiler. There is the same disregard of levels as in fixing electrical cables. "In a six-storey building," for instance, "the boiler, the apparatus, and the whole of the horizontal mains, flow and return, can be fixed on the sixth floor or the roof above it. No horizontal pipes whatever need run through any room, nor need any pipe be fixed in channels nor below the floor." Hence the system is peculiarly applicable to hospital work, for example, where it is specially necessary not to provide the "ideal breeding place for disease-germs" represented by a damp, dirty, warm, and dark pipe channel beneath a hospital floor. The pipes required in this system are, it is claimed, less than half the diameter of those for an ordinary circulating system, and less than those in a low pressure steam system. This use of small and inconspicuous pipes is of both economical and artistic advantage; they not only cost the less, but can, if necessary, be concealed behind skirtings and dado-boards; or, even if they are not hidden, they are unobtrusive. The temperature of the water is under perfect control, and can be regulated from lukewarm to boiling, and it circulates equally well at any temperature, and the apparatus absolutely prevents boiling over of the water. It is fed by a single steam pipe, and may be worked with exhaust steam only. The position of the boiler is immaterial; it may be quite away from the building heated. The apparatus has been successfully installed at a large number of important buildings, including the Brighton Aquarium, asylums at Cardiff, Newport, and Bodmin, many churches, chapels, and schools, at the universities of Leeds and Johannesburg, at several country houses (including Hardwick Hall, the residence of the Duke of Devonshire), and at hotels at home and abroad.

* * *

Messrs. Bassant Bros., parquet flooring makers, etc., 87, Charlotte Street, Fitzroy Square, announce that they have converted their business into a private limited company, which will in future be called Bassant Bros., Ltd. There will be no change in the conduct and management of their business, as the directors of the new company are the present partners, namely, Mr. C. W. Bassant, Mr. B. Bassant, and Mr. L. B. Hills.

Coming Events.

Thursday, February 18.

CONCRETE INSTITUTE.—General meeting. Mr. L. Serraillier, on "Certain Aspects of Reinforced Concrete," 8 p.m.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS.—Mr. Noel Heaton, B.Sc., F.G.S., on "The Materials of Construction and Decoration," 8.30.

Friday, February 19.

BIRMINGHAM ARCHITECTURAL ASSOCIATION. — Mr. Frank T. Baggalay, F.R.I.B.A., on "Roman Architecture."

INSTITUTION OF MECHANICAL ENGINEERS.—Annual General Meeting, 8 p.m.

ARCHITECTURAL ASSOCIATION.—Mr. A. Needham Wilson, A.R.I.B.A., on "The Press and Architecture," 7.30 p.m.

Monday, February 22.

REGENT'S STREET POLYTECHNIC.—M. A. G. H. Thatcher, on "English Methods of Scaffolding." 8 p.m.

Tuesday, February 23.

SURVEYORS' INSTITUTION.—Annual Dinner Whitehall Rooms, Hotel Metropole, 6.30.

Wednesday, February 24.

GLASGOW INSTITUTE OF ARCHITECTS.—Business Meeting.

Monday, March 1.

PRACTICAL NOTES

FOR

ARCHITECTURAL DRAUGHTSMEN

BY

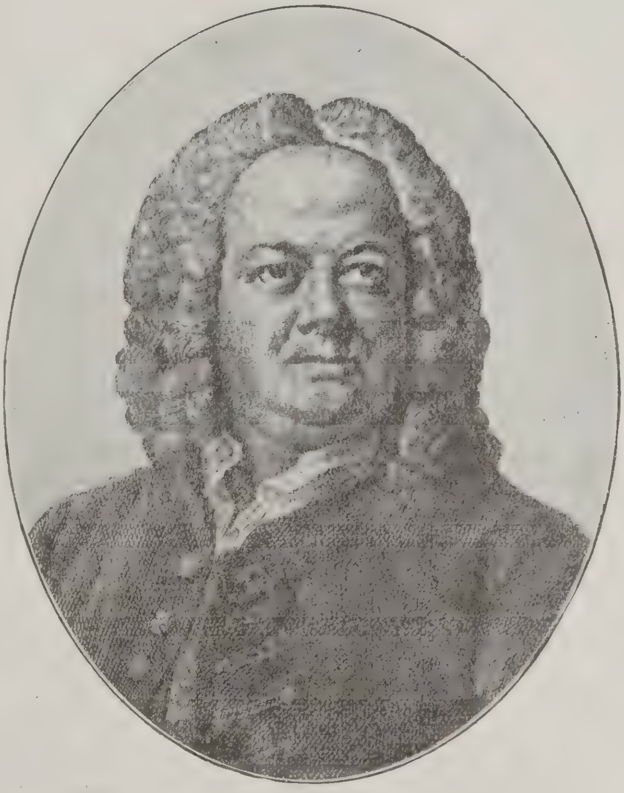
A. W. S. CROSS, M.A., F.R.I.B.A. and A. E. MUNBY, M.A., A.R.I.B.A.

Part 1. The Orders and their Application.

Plate 1. Introduction.
" 2. The Four Orders.
" 3. The Tuscan and Doric Orders in detail.
" 4. The Ionic and Corinthian Orders in detail.
" 5. Details of Imposts and Arch Moulds.
" 6. Order upon Order and Intercolumniation.
" 7. Doorways and Pediments.
" 8. Windows and Entablatures.
" 9. Windows, rusticated treatment.
" 10. Venetian and other Windows.
" 11. Niches and their Treatment.
" 12. Block Cornices, Balusters, Entablatures and Entasis.

Part II. Details of the Orders.

Plate 13. Rules for Setting out the Volutes of the Ionic Capital by (1) Gibbs, and (2) Vignola and Palladio.
Plate 14. Details of Ionic and Corinthian Capitals.
" 15. Examples of Arcading (Ionic and Doric).
" 16. Examples of Arcading (Tuscan and Corinthian).



JAMES GIBBS.

Part III. Constructional Details.

Plate 17. Domes.
" 18. Pendentives, Circular Staircases and Wreathed Columns.
" 19. Gothic Tracery and Vaulting.

Part IV. Perspective.

Plate 20. Notes on Architectural Perspective.
" 21. Setting up a Perspective.

Part V. Shadows.

Plate 22. Explanatory matter regarding the projection of Shadows.
" 23 to 27. Examples illustrating Shadows on various architectural details.

"PRACTICAL NOTES" contains a mass of valuable information which it is essential that the Architect should know to enable him to give that harmony, grace and proportion which exemplified the works of Ancient Greek and Roman Artists, many of which are still the admiration of the whole world. It is invaluable to students preparing for the examinations of the R.I.B.A., showing how to draw The Orders correctly with the smallest possible amount of work and study.

Price for Complete Work, 12/-, including Portfolio.

We shall be pleased to forward a copy of this work on approval to any of our subscribers.

Notes and News.

The firm of Swinburne, O'Gorman and Baillie has been formed by the amalgamation of Messrs. Swinburne, Cooper, and Baillie, with Messrs. O'Gorman and Cozens-Hardy. Messrs. Swinburne, O'Gorman and Baillie will continue to practise as consulting engineers in electrical, automobile, and general work, at 82, Victoria Street, Westminster, S.W. The partners are:—J. Swinburne, M. O'Gorman, and G. H. Baillie. Mr. W. R. Cooper has severed his connection with Messrs. Swinburne, Cooper and Baillie, and will continue to practise as consulting engineer in electrical and experimental work at 82, Victoria Street, S.W.

* * *

At the meeting of the Architectural Association on February 5th, the president (Mr. Walter Cave), announced that Mr. Phené Spiers had presented the association with an original drawing by Professor Cockerell, of a proposed library at Cambridge. The drawing is an exceptionally beautiful piece of work.

* * *

New elementary schools for the Lancashire County Council are now being erected at Failsworth, and also at Great Crosb-, under Mr. Henry Littler, County Architect. The constructional steelwork, concrete floors, and asphalte flat roofs, are being carried out by Messrs. Homan and Rodgers, Manchester.

* * *

In a recently-issued novel, one of the characters makes some observations reflecting on the water supply of Cheltenham. The author, it seems, was really thinking of some other town. He accordingly writes to the papers to offer his sincere apologies to the town of Cheltenham, the purity of whose water supply "has never been questioned."

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

BUILDER'S or Architect's Junior Assistant (18), good tracer, well up in prime cost, and general office work; excellent references; three years' experience. — J. W., 164, Wellesley Road, Ilford, Essex. 4833

CARPENTER, or Handy Man, tall; age 34; take charge on large jobs, wants work; 7 years' good reference; moderate salary.—H.C., Box 4838, Builders' Journal Office.

CLERK of Works seeks re engagement; just finishing public building; varied experience, notably ferro-concrete construction; well recommended; testimonials most excellent; age 45.—A. B., Box 4814, Builders' Journal Office.

CONTRACTOR'S outdoor manager and surveyor desires engagement; present situation 17 years; age 37; keen on variations; expert in measurements; all trades, quantities, estimating; town or country.—W., 2, Dalberg Road, Brixton. 4776

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, Builders' Journal Office.

ENGINEER, general, wants permanent appointment, official or private staff; thorough all-round experience; electrical, plumbing, smith, married, 34; good testimonials.—86, Bathurst Gardens, Willesden. 4704

ESTATE Owners.—Bricklayer, all-round, stone-waller, and general repairs; abstainer; good references; moderate wage for permanency.—Quinton, 12, Holland Road, Aston, Birmingham. 4802

FIREPROOF Engineers and Concrete Specialists. Advertiser, connected with above trades for 20 years, and whose name is well known in connection with same, desires position as manager, traveller, or head clerk; first-class book-keeper; aged 33; very moderate salary.—P. W. Potter, 73, Penshurst Road, Thornton Heath. 4719

FIRST Class Architectural Designer and Draughtsman, artistic and practical, experienced in planning; elevations and details, office and competition work; moderate salary.—Apply Box 4792, Builders' Journal Office.

FOREMAN Painter (working) seeks re-engagement); experienced in all class work in building trade, as for general alterations, etc.; good supervisor, and reliable; either town or country; abstainer.—X. Y. Z., 8, Barton Street, Westminster. 4807

GENERAL Foreman seeks re-engagement, thoroughly practical in all branches; trade, carpenter and joiner, good draughtsman, first class references; town or country.—A. J., 196, Murchison Road, Leyton. 4804

GENERAL Foreman seeks re-engagement; alterations or new, practical experience in all branches; carpenter and joiner; good references; age 30; moderate wages.—Caplen, 3, Victoria Mansion, Edgware Road, Paddington, W. 4779

GENERAL Foreman seeks re-engagement, thoroughly practical and reliable; new or alterations; carpenter and joiner; life abstainer; first-class references.—Foreman, 3, Hawbridge Road, Leytonstone. 4787

HEATING.—Schemes, quantities and prices, tracing, workmen's sheets and costs; shorthand-typist (speeds 90/40); 5 years in Midlands; good refs.; disengaged.—Box 4834, Builders' Journal Office.

JUNIOR Assistant desires situation, home or abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate salary.—Box 4613, Builders' Journal Office.

PAINTING, paperhanging, distempering, graining wanted, piecework, new work at greatly reduced prices; specimen showing architects' and surveyors' testimonials for quality and cheapness.—Galton, 6, Parolles Road, Upper Holloway, N. 4761

PLASTERER, good jobbing bricklayer, roofs, fire work, stoves, tiling, etc., etc., generally useful, good reference, moderate wages, non-union.—A. Trigg, 117, St. John's Hill, Clapham Junction, S.W. 4856

QUANTITY Surveyor's Assistant (21), 4 years' experience, desires engagement, certificates and good references. — Apply Box 4745, Builders' Journal Office.

QUANTITY, General Surveyor's Junior Assistant, four years' experience; working up measuring existing buildings, good draughtsmen, little estate work; City Poly student.—J. R. O., 233, Essex Road, N. 4844

REINFORCED concrete foreman, disengaged, long and varied experience, especially in Kahn bars and expanded metal, timbering a speciality; carpenter by trade; good refs.—G. C., 59, University Road, Tooting, London. 4721

R.I.B.A. Final Exam., 7 years' experience, 1½ in Paris; good all-round man requires berth at home or abroad; good refs.; salary moderate.—Box 4799, Builders' Journal Office.

SHOP-FITTING, advertiser (38), well up in all branches of air-tight work, seeks situation as foreman in shop-fitting or joinery works; 9 successive years' with present employer.—Apply, Box 4837, Builders' Journal Office.

SUN copies, tracings, and plans prepared.—Geo. Tune, Trevor, Llangollen, N. Wales. 4831

SHOP or general foreman, good draughtsman, good all-round experience, including reinforced concrete work; or as estate manager, preparing plans for same, etc.; country preferred. — "St. Osyth," Goldsworth Road, Woking, Surrey. 4829

TO Estate Owners, builder, experience, in all trades, desires position as manager (working or otherwise); plans prepared, quantities, setting out, accounts and supervision; abstainer; country preferred.—Box 4806, Builders' Journal Office.

VOLONTAIRE.—Foreign gentleman (21) desires position in builder's office, with opportunity of learning.—B. B., 43, Bolingbroke Grove, Wandsworth Common, S.W. 4789

Appointments Vacant.

ARTICLED Pupil, vacancy for same in an old-established architect's and quantity surveyor's office, on the South coast; trained under principals; moderate premium; part returned. A typewriter will receive greater consideration.—Apply Box 4822, Builders' Journal Office.

BUILDERS' Junior Assistant wanted, accustomed to tracing and general office routine.—Apply, T. S. Foster, Builder, Abergavenny, Mon. 4840

WANTED immediately, Architectural Assistant in public office in North, for 6 months, where a variety of work is being carried out, to prepare sketch plans from instructions, working and detail drawings, specifications, etc., with thorough knowledge of quantities; he must be a quick and good constructional draughtsman; salary, £2 5s. per week. —Apply, with copies of 3 recent testimonials, to Box 4836, Builders' Journal Office.

WANTED, Junior Assistant, also improver; state age, salary, full particulars.—Box 4858, Builders' Journal Office.

WANTED immediately, one or two good men thoroughly experienced in composition floor-layers. —Apply, giving experience and wages required, Box 4860, Builders' Journal Office.

The Grand Manner. It is significant of the trend of architectural design that Professor Reilly should read a paper on "The Grand Manner in Architecture" before the Sheffield Society of Architects. It is becoming evident to thoughtful people that thorough training in classic and academic architecture is an absolute necessity if Britain is to produce any fine public buildings. The outcry that always occurs after a big competition, such as that for the London County Hall, inevitably results from lack of architects trained on the lines obtaining at the Ecole des Beaux Arts. Professor Reilly takes the three main qualities of the grand manner as "unity, largeness of scale, and restraint." "The sublime," he said, quoting Sir Joshua Reynolds, "impresses the mind at once with one great idea. It is a single blow." It is perhaps one of the unfortunate results of the Gothic revival that present-day architects are inclined to look after the details and let the mass take care of itself. It is equally reprehensible that some of the younger Classic school are inclined to make the massing of their buildings everything and leave the details to chance. At the same time the mass is the first thing in the building that tells. As the majority of people have little time to study anything else, it is well that the first impression of the building should be a good one. The architect may find many beautiful details in a ragged building; it is doubtful whether the general public will ever do so. Professor Reilly is only asking for the necessary concomitant to town planning, or, as Mr. Lanchester has it, "The importance of ordered dignity and grace in our towns." It was pointed out to us the other day that what our architectural schools most require is a demonstrator trained at the Ecole des Beaux Arts, and that sound Classic training and a thorough knowledge of axial planning would work wonders in the design of our future public buildings. At the present time we are hopelessly behind France, Germany, Austria and America in the matter of public architecture and planning, and shall continue to be so unless the Board of Architectural Eduction bestirs itself more thoroughly than it has done heretofore. It is satisfactory to find that in Liverpool Professor Reilly has made a beginning. Quite recently we published particulars of Mr. Lever's donation to the Liverpool School for the purpose of studying town planning. Probably no centre in England is more fitted to commence such a good work than the city which enshrines St. George's Hall.

The Architectural Profession of To-day. Mr. James Crocker, the retiring President of the Devon and Exeter Architectural Society, made some pointed remarks in his last presidential address at Plymouth on the 13th inst. on the subject of overcrowding in the architectural profession, and on the question of registration, which he regards as the remedy for the trouble. In this matter Mr. Crocker is following a lead which we gave some months ago in our series of articles on "The Architectural Profession of To-day"; articles which brought numerous letters showing how, in the provinces, both principals and assistants were suffering acutely, and unemployment was rife. Mr. Crocker has, however, discovered another cause—the abnormal increase of speculative building. Concerning this he says the public have yet to learn that "building is not necessarily architecture," or that there is but a "slight difference between a jerry-built house and a well-built one." Mr. Crocker believes that if architects in the country were to put into practice what the enormous majority of them are perfectly agreed upon, they might bring about the registration measure without delay. He spoke strongly of the official indifference which was one of the gravest hindrances to the passing of the Registration Bill. He referred to the overcrowded state of the profession (which the Registration Bill would partially cure) and remarked on the great facilities for learning drawing and architecture in the various schools and colleges, creating draughtsmen by machinery. It would be wisdom if some amendment of the apprenticeship system could be enforced by law. The temptation to take large premiums from the parents of lads who are naturally unfitted for the architectural profession is only too easy, and it is often done without any real intention of properly instructing them in the rudiments of their profession. The addition of the schools and colleges has taken considerable responsibility off the shoulders of the architect, who usually insists on the attendance of his pupils at the local classes as a necessary supplement to the experience to be obtained in his office. Practically all the instruction the apprentice receives is at these classes, with such wrinkles as he can pick up from the other draughtsmen. The personal experience of the principal, which is such a helpful factor to the architect he knows nothing of, and thus parents are very often deceived about their sons, because the principal never troubles to gauge their capabilities for an artistic career.

Town Planning. The paper read by Mr. H. V. Lanchester on the 15th, at the Royal Institute of British Architects, and the paper read by Mr. Needham Wilson, at the Architectural Association last Friday night, have a certain connection between them, in that they both draw attention to the public interest, or want of interest, in matters architectural. Mr. Lanchester has been studying an important question, which was bound to attract more or less attention as it is the subject of an important Bill to be dealt with during the present session of Parliament, and will have far-reaching consequences on the future housing of the population. "The Times" devotes a leading article to this lecture, but largely nullifies the importance of an architect's views by calling him "Doctor" Lanchester throughout. It is an unfortunate fact that architects have been boycotted by the President of the Local Government Board all through the drafting and preparation of the Bill; and the overtures of the R.I.B.A. and its very pertinent reminder that the subject concerned architects as much as any other class, only brought down upon them what we have previously described as a snub—the snub of being ignored. "The Times" itself but emphasises the difficulty which all town planners will have to contend with when they actually get to work: that is, the aversion of many people who claim to have an æsthetic or artistic objection against "the importance of ordered dignity and grace in our towns." The comparatively recent proposal to treat the buildings in Kingsway as a complete and ordered scheme for the purpose of making a fine street was at once met with diatribes from these same people against the monotony which the carrying out of such a scheme would in their opinion entail. The average pictorial artist is ever ready to find greater beauty in a tortuous street of haphazard design than in the finest boulevard to be found in Paris, Berlin, or Vienna. The trouble is a division of opinion among artists—a dispute between the architects and the painters—and it will take some getting over. Possibly Mr. Burns feels that this is exactly his opportunity to shine as a plain business man entrusted with great administrative powers; and in effect he says "A plague on both your houses," and endeavours to carry out his schemes with the sole assistance of the practical engineer. We think that the game of attempting country planning in towns has lasted long enough; that if we are to live amid square miles of houses the owners or builders of these houses have a definite obligation towards the community, and that they must defer to the opinions and feelings of the community as guided by professional men whose experience and education entitle them to be heard on such a matter. On their private grounds in the country the lover of chaos can build what seems best to him, but some kind of regulation and order are required to prevent the outskirts of towns being given up to "monotonous ranges of inanely designed and badly built houses, our slums of the future." And meanwhile those people who prefer chaos should remember that cities are artificial creations, and their growth must be dealt with by regulations suitable to the growing needs of the people.

The Evolution of Indian Architecture. Indian architecture has hitherto been but little studied, for obvious reasons. Interest in it, however, is certainly increasing. At a recent meeting of the British Academy, Mr. A. A. Macdonald, Boden Professor of Sanskrit in the University of Oxford, read a most interesting paper on "The Evolution of Ancient Indian Architecture," in which he traced the builders' art to its most primitive beginning. Owing to the lack of early historical literature, he said, the study of archæology in India was relatively of more importance than in any other country; but the rapid destruction of the remains had only been arrested by the passing of the Ancient Monuments Preservation Act by Lord Curzon in 1904. In the pre-Buddhistic period, Professor Macdonald remarked, the buildings were of wood, there being no temples, nor carved images of gods. Bricks first appeared in the fifth century B.C., and from the middle of the third century B.C. the Buddhists began to build in stone. The history of Buddhist architecture might be divided into three periods—250 B.C. to 50 A.D., 50 to 350 A.D., and 350 to 650 A.D. Of the three classes of buildings (1) the stupa was a development of the low sepulchral mound of earth, and was originally a hemispherical structure erected to enclose relics of Buddha; the ornament on top (called a tee) ending in one or more umbrellas. By successive stages, both the stupa and the tee were elongated to assume the shape of a tower. The former then became attenuated, while the tee grew in height, the umbrellas becoming roofs, ultimately reaching the final development of the nine-storeyed Chinese pagoda, in which the stupa was no longer seen; (2) the chaityas, or assembly halls, were wagon-headed structures, with aisles and an apse, under which was placed a small stupa as an object of veneration. The earliest were rock-cut specimens dating from the third century B.C., and obviously imitating wooden buildings. The originally quite plain stupa had later a figure of Buddha carved on its front. About 600 A.D., the stupa became a hollow cell with the figure inside, and this marked the transition to Hindu architecture. The subject seems to deserve closer attention than it has hitherto received, for the more intimate study of early Eastern architecture may quite possibly reveal some hitherto unsuspected relationships with the art of the West.

The Art of the Plasterer. If the revival of the art of the plasterer is not proceeding on right lines, it is not for want of competent advice. The subject is being taken up enthusiastically by men who have a very clear perception, not only of its possibilities, but, what is perhaps even more important from the artistic point of view, of its limitatons. Mr. William Banbury, who read a paper recently on "Decorative Plasterwork" to the Aberdeen Architectural Association, is of this enlightened school. He urged that the material must in no circumstances be forced into unnatural forms, and should by no means be perverted to the imitation of effects that are proper to wrought iron, or to the carving of wood or stone. Fortunately, the mania for "sharpness" is dying out, even among photographers, and the peculiarly soft effect native to properly produced plasterwork is now becoming recognised as a merit instead of being despised as a defect. It is in certain respects inimitable, and therefore it need never be imitative. The art is not only venerable for its antiquity—work of the kind was found in Mesopotamia, ancient Egypt, and old Greece and Rome—but had the sanction of the Italian masters of the Renaissance, by whom it was introduced into England in the time of Henry VIII. As the Scottish plasterers are certainly among the best craftsmen engaged in the work, it is not surprising to find that so much interest is being taken in the subject up north, especially when such able lecturers as Mr. Banbury are at command. The working plasterers were at one time a very "close corporation," and it was even said that they were all related to each other in various degrees of kindred affinity! If the demand for artistic plasterwork continues to grow at the present rate, this interesting little family group will hardly be able to cope with its volume; and some of the family traditions that happen to be out of accord with the truer and purer principles that are being advocated with such sturdy insistence will have to be abandoned.

The Clerical Architect. We have, for some time past, been following a controversy in our contemporary "The Tablet," upon the question of the clerical architect, or, as one of the controversialists puts it, "an ecclesiastic, who is also an architect at one and the same time." It appears that one or two of the Catholic clergy are reported to have been trained as architects, and the Canon Law of the Church does not prohibit their acting in both capacities. The grievance of the architects is that these clerical architects work without fees, for the benefit of the Church, it is true, and thus help to make the already hard lot of the architect still harder. The trouble seems to be confined to the Roman Catholic community, which, however, numbers in its ranks several of our well-known architects. We should hesitate to intrude on what appears to be a family dispute, were it not for the fact that a cleric, writing under the nom de plume of "An Old Priest," makes general charges against the architectural profession of receiving discounts from contractors, which he does not allow to his clients. This is a very grave offence, and, as Mr. C. M. Hadfield points out, entails expulsion from the Royal Institute of British Architects, and is also actionable at law. It is not conformable with the polite usages of newspaper controversy to make general and grave charges against the profession to which your opponents may happen to belong, nor do we think the matter is improved when "An Old Priest" unhesitatingly withdraws the statement, so far as Mr. Leonard Stokes is concerned, because Mr. Stokes writes—quite superfluously, since he of all men is entirely beyond suspicion—denying point-blank that he ever received discounts from contractors. It would be more to the point if "An Old Priest" would point out those architects whom he knows are in the habit of receiving discounts from the contractors; the Royal Institute of British Architects, at all events, is open to receive and act upon such information. It is extremely regrettable that such charges should be made, even in the heat of controversy; and it does not savour of the sublime charity which one usually associates with the cloth.

No More Workhouses. The report of the Royal Commission on the Poor Law, which was published last Wednesday, will in effect create new conditions with which the architect and the builder will be called upon to deal. The old system is to be ruthlessly swept away, and new methods and a new spirit are to be introduced. The Poor Law Guardians are to be abolished, and such buildings as they were wont to commission will forthwith become obsolete. The poor are no longer to be lumped together without classification in the "general mixed workhouse." They will be distributed among seven separate institutions, which will severally accommodate (1) the children; (2) the aged and infirm; (3) the sick; (4) the able-bodied men; (5) the able-bodied women; (6) the vagrants; and (7) the feeble-minded and epileptic. It would seem, therefore, that we shall get smaller buildings and more of them. They should by no means be allowed to perpetuate the characteristic features that rendered the old type of building so repulsive. On the contrary, they may be reasonably expected to express the new spirit—the more discriminating and more humane view of the poor who are always with us, and whose poverty, always deplorable and sometimes reprehensible, is frequently blameless and even honourable. There thus arises an excellent opportunity of evolving a new type of building, with seven variations, and in every one of them there should be visible a comeliness and a kindliness that hitherto have been too often felt to be inappropriate to the architectural treatment of a mere workhouse. Architects will be glad to soften the asperities, and to design buildings that shall at all events be less blatantly brutal than the elevations hitherto most commonly associated with rate-aided poverty. We are not blaming the architect of the old-style workhouse. He was governed by a bad tradition, which should now be swept into oblivion, and from which he will be heartily glad to make his escape. How is it that almshouses are usually pleasant to look upon, while workhouses are exactly the reverse? Is it not because of the very different spirit in which the charity is administered in the two cases? In the almshouses it is voluntary and genial; in the workhouses, reluctant and austere. Therefore, in the one case the architect is apt to embody the spirit of love and pity; in the other he has found it difficult to disguise the spirit of contempt. His new employers will set him a far more congenial task. The abolition of the workhouse is an æsthetic boon.

BLACKPOOL CENTRAL LIBRARY COMPETITION: ONE OF FIVE DESIGNS BRACKETED FOR SECOND PLACE. RUSSELL AND COOPER, ARCHITECTS.

R.I.B.A.

TOWN AND COUNTRY: SOME ASPECTS OF TOWN PLANNING.*

By H. V. Lanchester, F.R.I.B.A.

Relationship of Town and Country.

The selection of the title "Town and Country" for the paper is due to the author's conviction that we, as a nation, regard their relationship to each other as the most important factor in town planning. It is hardly necessary to hint that the average educated Englishman values the country far above the town, regarding the latter as a necessary evil, to be tolerated only on account of its uses in making a living, or for certain specialised and concentrated forms of amusement to be indulged in with moderation and within definite limits of time. This attitude is hereditary. The Saxons called the city "the grave of freedom," and when they took possession of our island destroyed the Roman towns and settled in small hamlets. This preference induces a neglect of the city in respect of anything beyond speedy and convenient means of intercommunication and of transit; and if these demands are fairly well met our typical Englishman is satisfied, not possessing sufficient imagination to realise the requirements of those whose lives are necessarily spent within the town or immediate suburbs. The activity of societies having for their object the preservation of those areas of our country possessing claims to special beauty or interest is sufficient proof of the strong national feeling on the question. As the result of this feeling, the importance of ordered dignity and grace in our towns has never been felt here as on the Continent, where the city has always taken first place in the minds of all classes. Valuing the country as we do, we can only consider our towns in their relation to their surroundings, and we shall as a nation devote more attention to this relationship than to the actual embellishment of the city itself. This axiom may not be endorsed by the architect; it requires, indeed, some effort to accept it; but it is by this route that the first advance will be made.

Proportions of Streets and their Buildings.

We, of course, recognise that a long and important street, particularly if straight, demands an effect of breadth in one form or another; but our present regulations indicate that we are far from appreciating what is a satisfactory relationship between the breadth of a street and the height of its buildings. The author had examined a number of thoroughfares that either fail or succeed in satisfying one's æsthetic instincts, with the result that he believed it possible to lay down the following rough-and-ready rule—viz., that the height of the buildings should not exceed two-thirds of the width between them, unless it is at least one and a half times this width. Any proportion between these is unsatisfactory, though less so in the case of irregular streets and with buildings having broken sky-lines. Now the narrow proportion is unsuited to residential districts, and therefore the former one should be the limit; but in closely built commercial areas there will doubtless be many streets of the narrower type, though in our climate it would be well to avoid them on an alignment east and west. If such a narrow street exist, every effort should be made to open it up to the sun on the south side by recessing frontages and reducing heights of buildings at certain points.

With the object of treating the question in an orderly and definite manner, the author asked his hearers to transport themselves a short distance into the future, and to regard as materialised some of the aims and aspirations that are engaging our attention at the present time.

Ten Years Hence.

Let us in imagination start out some ten years hence from the business centre of one of our larger provincial cities, passing in turn the buildings devoted to government, to recreation, to education, and to various types of residence, till we arrive at the outermost limits. We drop down the lift from our office, and emerge into one of the narrower streets. No very great difference is noticeable in these, except that within the business centres they are entirely given up to pedestrians, no vehicles being permitted there between the hours of 8 a.m. and 8 p.m.; while in the wider streets only light cabs are allowed, the large and heavy vehicles of the public service being confined to a few main arteries, and no goods traffic at all is to be seen at this time except light vans that are certified equal to a pace of ten miles per hour.

Before starting on our route towards the south-west we will take a few steps eastward to look at one or two of

The Great Warehouses.

Some eight years back (in the year 1901, I believe) the congestion in this area compelled our municipality to appoint a traffic commission, which reported that to remedy adequately the existing state of things new thoroughfares were needed at an estimated cost of near four millions; fortunately, before any practical steps were taken, the Chamber of Commerce sent a committee of investigation to Chicago, and then, bringing all the traders into a syndicate, extended the terminal of the great main line to the East Coast docks, by means of radiating tubes in reinforced concrete some forty feet deep, which communicate with every warehouse in this section by means of lifts. The city contributed two and a half millions to the scheme, holding bonds to this value, and the economies effected have resulted in a great expansion in the trade of the town. The old streets have proved adequate to the retail business, but it is enacted that in ten years' time each owner will have to provide standing room on his own premises for vans loading and unloading.

The Collecting Road.

We will turn our steps towards the south-west, this being the shortest route to the collecting road that encircles the business area. When starting the improvements, it was felt that such a road was desirable, and it was carried through the districts just going out of use for residential purposes. It has been almost entirely taken up by shops and hotels, while there are also three theatres facing into it. Considerations of cost did not admit of this street being expended into a boulevard, but fortunately two large squares are in close proximity, and they are linked up to it by broad avenues. At the point where we reach this zone, a space has been cleared for the municipal group; this was formerly the site of the workhouse, with the addition of two acres from the churchyard of the Georgian church you can just see standing back between the town hall and the law courts.

You have doubtless been disappointed hitherto at not having seen more study of

Decorative Effects

in our streets, but it was considered that the stress and rush of business detracts from the likelihood of a proper appreciation of such embellishments. In this square, however, you will realise that we have not been neglectful of our monuments and their setting; the rise in the ground has enabled us to place the city hall on a podium carrying several important groups of sculpture that complete the scheme of the sculpture on the building itself. The advisory committee of architects has always recommended that all monuments should be so placed so as to be seen only against a suitable background, and that if possible they should form part of the composition of a building or group of buildings; for example, you see the memorial museum in course of erection between the square and the little public garden to the north. The centre bay of the loggia will frame in a statue.

The Plaza.

Three examples of the closing in of the public place, as strongly advocated by Camillo Sitte, were cited. The first, from Nancy, shows the buildings connected by semi-circular loggie; in the second (the Plaza de Commercio at Lisbon) they are skilfully linked up by a triumphal arch; while in the third the desired effect is produced by the closing of a short vista with a building designed in harmony with those fronting on the *place*. This last has the advantage of being both more subtle and more practical than the other two, though, of course, there is room for the adoption of any of these three solutions, not to speak of a fourth in which the planting and massing of trees would take an important part.

Passing on from the lines of the square to its decoration, we may notice a few views of

Sculptured Monuments and Fountains,

particularly studied with regard to their surroundings. From these we may turn our attention to sculpture treated in direct relationship to an architectural composition.

It is time we continued our route towards the outer suburbs, but we have yet to pass through a zone mainly occupied by residential hotels and the better class of tenement blocks, inhabited by those whose disposition or whose employment leads them to prefer this type of dwelling. These have mostly been built during the last fifteen years, and we were enabled to put in force by-laws regulating the cubic amount of building that might be put on a given area, and thus secure good gardens and open spaces between the six- and seven- storey blocks. Though the gardens are not all public property it has been found convenient to place them in the charge of the municipality.

A few hundred yards further we reach one of our most important undertakings—

The Great Water Avenue.

You will remember our river, a turbid and tortuous little stream, of which by no stretch of the imagination could one be proud. Here it came within a hundred yards of the main road, and then burrowed away under the railway goods yard to the north-west, returning again under the line about a mile further on, just where the open country used to begin. This long loop was hopeless—in addition to two tunnels under the railway, there were three or four factories, the appearance of which destroyed all chance of doing anything with it; at the same time it was felt that it would be a fine thing to make a river a feature in the design of the city and to provide a convenient location for water sports. As there was but a strip of less than a hundred yards between the main road and railway a landscape treatment was obviously unsuitable and the straight canal almost suggested itself.

At the city end a circle a hundred and fifty feet in diameter is surrounded by a raised terrace formed by the boathouses, etc., with a terminal and two flanking monuments; from this there is an uninterrupted stretch of over three-quarters of a mile with two bridges, and then a wider basin surrounded by an embankment terraced to give a view of the finish of races and of the water sports usually held here. On either side is a double avenue, and beyond this lies on the one hand the thickly planted mound screening the railway, and on the other a narrow garden abutting on the main road. The straightening of the road formed part of the scheme, and this giving a series of irregular strips on the other side, the readjustments afforded the opportunity of providing an enclosed garden which helps to balance the effect of the water avenue on the opposite side of the road. This garden is gradually being ornamented with monuments illustrating the principal events in the history of the city.

The other

Main Avenues Out of the Town

are very varied in their character, more than half are the old highways that were in many places far too narrow for the traffic that

BLACKPOOL CENTRAL LIBRARY COMPETITION: ONE OF FIVE DESIGNS BRACKETED FOR SECOND PLACE. THOMSON AND BRISTOW, ARCHITECTS.

streamed through them. We began by widening there.

The University Group.

Following our water avenue, we reach, on the south side of the road, the university and group of buildings in connection with it. These have undergone extensive remodellings in recent years, largely due to a revolution in the views of our educational body. This change of ideal has brought about a marked alteration in the character of our university and allied buildings. Bodily training has not, of course, been forgotten, and the provision of a campus has given the opportunity for a broad and dignified piece of architectural composition in the buildings grouped round it, while the position selected for this section leaves in quiet seclusion the avenues and lawns allotted to the more meditative students. Of course, we could not adopt the grandiose lines of the newer American universities, such as those of California and Pittsburg, and our national instincts are against working on quite so large a scale, but we have obtained valuable hints from these more ambitious schemes. Immediately beyond the university group is placed the new museum, of which one might say much did time permit, and beyond this lies the park devoted to zoological and botanical collections. In this park are built up various large-scale geological models designed to give effects approximating as nearly to the real thing as possible. This park forms one of the series of inner parks all within two miles of the heart of the city.

When the problem of **Arranging a Park System** first arose, opinion was divided into two sections, and discussion ran high for some time, one party taking the view that the traditional type of the English park should be adopted, and the other that all natural characteristics should be preserved and maintained, and that the sharpest possible contrast should be presented to the artificiality of the city, all boundaries extending far enough to make the landscape complete.

Thoroughfares and Parks.

We usually endeavour to avoid running important thoroughfares in juxtaposition to parks and gardens, the main approaches being reserved for the park only and not forming part of the scheme of communications. Passing from these to the larger and more remote parklands by means of the aforementioned parkways, we may note that the latter vary considerably in character; in some cases we have provided a boulevard parkway with electric tramlines on which a specially aranged service is run on Sundays and holidays; others have footways merely, through selected strips of country retaining as far as possible a rural character; and thus at a minimum of expense all classes of patrons are brought in touch with the places of recreation.

The proportion of the country now laid under contribution to provide open spaces for our cities makes it obvious that the time is rapidly approaching when the whole of England will for this purpose be divided into spheres of influence more or less under the control of the great centres of population, much as the land has already been divided up for purposes of water supply.

The river itself has been but slightly altered, except by the addition of the necessary weirs and boatslides to render it navigable. There is fortunately but one factory abutting on it within the next few miles; this building has recently been remodelled by one of our leading architects, so that it presents a good appearance from the road, and its two pearl-grey concrete shafts are not ungraceful.

Two miles further on we come to the largest of **Our Suburban Villages,** already a town of some 5,000 inhabitants when our improvement scheme was started. As the high road narrowed considerably here we had again to resort to duplication, which was the more necessary by reason of the facts that the old church and a particularly fine group of almshouses faced each other at a distance of only thirty-eight feet, and that there were, moreover, several particularly fine Georgian houses demanding preservation. This old high street is throughout full of charm which any widening would have entirely destroyed; it has but one serious blot in that group of a dozen shops, the work of a speculative builder some eight years back—they are too substantial to pull down, but they are now to be refronted at the expense of the city, with the consent of the owner. The design for the front is the subject of a competition between the most successful graduates in architecture for the past six years, and it is quoted as an example of the way in which our authorities are endeavouring to open the way to secure public appreciation of the best talent in our younger men.

Beyond one of the village suburbs, of which there are many, we come out into some broken common, and on the further side of this we reach the limit of our operations in this direction; the course of the river has been dammed to make a spreading lake, and beyond it is a thickly planted stretch of wood, a favourite picnic ground in the hotter days of summer. Over this you can see, away to the north-west, the long ridge which is included in our largest rural park, and from which vantage point you can obtain the well-known view over six counties. Here we may terminate our excursion.

"In this imaginary description" [of which a great deal has been reluctantly omitted, for want of space], Mr. Lanchester added, "I have endeavoured to be thoroughly practical and to suggest nothing that would not be easily within the powers of any of our great municipalities if once they can be got to realise the desirability of such an achievement. How far I have succeeded in this aim I must leave it to you to decide."

Discussion.

Mr. F. W. Speaight said he was sure they had all followed with great interest the imaginative journey on which Mr. Lanchester had conducted them, but he was afraid that the conception was too lofty for realisation. All such schemes should be accompanied by a financial statement, in order to convince the man in the street of their business character.

Mr. W. H. Lever, M.P., said he believed that England's backwardness in regard to town planning was due to a great extent to unfamiliarity with the examples in other parts of the world. With the exception, perhaps, of Edinburgh, he believed that there was not in England a single admirable example of town planning. If they kept their ideals before them, he was confident that it was simply a matter of time before they would be able entirely to transform and improve the character of many towns, without incurring any overwhelming burden of expense. If, however, the reform was desired at once, it must necessarily prove a costly matter. The education of the town councillor was most important. The ignorance of the average town councillor was surprising, but perhaps was natural, considering his restriction of outlook. If centres such as Liverpool would take up the question of town planning, he was certain that enormous progress would be the inevitable outcome.

Mr. Andrew Taylor, L.C.C., regarded the paper as a delightful romance, and he sincerely hoped that the time would arrive when Mr. Lanchester would have the opportunity of realising the ideal so admirably conceived. Those who went to Vienna last year must have realised how much ahead of London that city was in regard to town planning. He believed that the movement was receiving helpful support in England, and he understood that Mr. Lever had offered a sum of money to be devoted to the education of students in this important subject.

Mr. Raymond Unwin fully believed that there was nothing useless in schemes which might be described as being "in the air." He felt confident that such schemes would have the effect of stimulating new work. They should not lose sight of the fact that the German departure in town planning from what was known as the "grand manner" ha dresulted in work too much niggled and worried. Too little attention, he was certain, was paid to the necessary widening, when improvements were contemplated. They had at Finchley Road one of the most important avenues leading from London; and yet a double row of tramlines was being laid without any widening, which meant that at some future date a much larger expenditure would be involved than if the necessary alterations were made now. He believed that a great end would be achieved if suburban authorities could be convinced of the desirability of building in groups—this necessitating the grouping of gardens also—instead of the method that at present prevailed.

Professor C. H. Reilly observed that a serious responsibility rested with him by reason of the fact that Mr. Lever had entrusted him with the project which had already been referred to. He could see that if the desired end was to be attained the architect would want a much wider scope from the outset. There existed a serious obstacle in the form of the borough surveyor, who would have to be taught to what limits his functions extended. He felt deeply indebted to Mr. Lanchester. He, with many others, had looked at Cardiff with a respect approaching to reverence; and they now realised that not only was he a true architect, but also a man who could dream dreams.

The vice-president, Mr. Edwin T. Hall, having briefly summed up the discussion, delivered himself of a eulogistic description of rural Dulwich. Nowhere within 200 miles of London, he asserted, was there a more beautiful and truly ideal spot. Its ancient college and interesting picture gallery were well worthy of a visit, and he advised all who had not experienced that pleasure, to do so at their first leisure moment.

Mr. Lanchester briefly replied.

THE THREE CHURCHES OF ST. PAUL.

By Mervyn E. Macartney, F.R.I.B.A.

At the meeting of the Liverpool Architectural Society held on February 1st, Mr. Mervyn E. Macartney delivered a lecture on this subject to a large assembly. In the absence of the president, Mr. F. G. Eccles, F.R.I.B.A., the chair was taken by Professor Reilly.

The first, or Saxon, cathedral, originally standing on the site, was destroyed by fire in 1085. The second, or Norman, cathedral, was founded in 1087.

In 1240, the choir was rebuilt or enlarged by being extended over the site of the church of St. Faith, which stood at its south-eastern corner, and to the dispossessed parishioners of St. Faith, a place of worship was granted in the crypt under the enlarged cathedral choir. Old St. Paul's represented a variety of styles from Early Norman to Decorated. It consisted of a nave 290ft. long, of twelve Norman bays, and north and south transepts of five bays each.

The cloisters, which were of small extent, stood in the angle formed by nave and south transept, and the chapter-house was situated in the cloister garth.

The fine Early English tower, which had a timber spire covered with lead, was built about 1315, ad destroyed by fire. It was rebuilt without spire, at which period the curious and remarkably bold flying buttresses were probably added.

The choir extended to twelve bays, and at the eastern end was a large rose window of superb tracery.

The nave was much used as a fashionable lounge, and even as a business exchange, until the latter part of sixteenth century or

BLACKPOOL CENTRAL LIBRARY COMPETITION: ONE OF FIVE DESIGNS BRACKETED FOR SECOND PLACE.

H. R. GARDNER, ARCHITECT.

beginning of the seventeenth century. It became known as "Paul's Walk," from the fact that about the centre of the nave there were doors immediately opposite each other in the outer north and south walls, these forming a ready means of communication for foot-passengers, who were spared the trouble of walking round the eastern or western ends of the cathedral; and so this passage came to be looked upon in time as a regular public "right of way."

King James I. was present on Sunday, March 26th, 1620, at divine service, when the Bishop of London preached a sermon from Paul's Cross, which stood on the north-eastern corner of the choir. At the subsequent banquet, it was agreed to issue a commision to raise money for carrying the repairs to the cathedral into execution. Inigo Jones was afterwards employed to erect a portico at the west end of the cathedral. A view of this portico, taken from old drawings of the period, was projected on the screen, and proved to be of somewhat curious design, in Corinthian Classic. Strangely enough, this portico was added not so much for any religious purpose, but more in order to relieve the congested state of the business operations carried on at the time in the nave, which resembled a market.

Sir Christopher Wren was then called in. Wren was born on October 20th, 1632, at East Knoyle, in Wiltshire, of which place his father was rector. In addition to being a master architect, Christopher Wren was an exceedingly clever scientist, mathematician, and astronomer. At the point mentioned, Wren proposed to take down the Gothic arches of the old cathedral, and substitute circular ones in Classic style, and to erect a Classic dome in place of the Gothic tower. The Great Fire of London occurred in 1666, before his intentions could be given effect, and that fire destroyed the chief part of the building and irreparably damaged the remainder.

The vast magnitude of the work, and the contemplation of the great expense requisite for building a new cathedral, caused a lapse of some years before it was finally determined that all attempts at "patching up" were hopeless. A commission was eventually appointed (in November, 1673) having authority to superintend preparation of plans for rebuilding the cathedral; and a preliminary design having been approved by the King, His Majesty issued a warrant on May 1st, 1675, for the commencement of the works.

The demolition of the old buildings took nearly three years to complete, and was not accomplished without much difficulty and danger; but, with the aid of gunpowder and battering rams, the last stone was laid low, and the foundations of the new fabric were commenced. These probably began at the east end, and were carried westward, owing to the fact that at the west end of the site Wren had erected a temporary chapel before commencing his new foundations. The original design prepared by Wren, and known as his favourite design, was a magnificent conception, by some still thought to be even superior to the building now erected, but it was rejected by the King on account of its "unecclesiastical arrangements." The model of this design is preserved in the cathedral library.

Wren subsequently prepared a revised design agreeable to the King's ideas and wishes. This, however, showed a sad falling-off, much to Wren's own disappointment. However, the opportunity having arisen to make some slight revisions in this design, Wren was strong man enough to prepare an entirely new design throughout, which is represented by the present structure. In planning the new cathedral, Wren changed the axis from that of the old cathedral, in order to get rid of the difficulty which would have been caused by building on the site of the old walls, whose foundations were known to be defective, and so to break perfectly fresh ground for his new foundations. Wren also prepared a magnificent scheme for improving the approaches to and environments of the cathedral, but it was not accepted, and the building was eventually enclosed by cast-iron railings on a stone base. These railings were subsequently removed on the western side.

Sir Christopher, though sadly hampered at the last through the jealousy and perverseness of his committee, fortunately survived to see the completion of his great masterpiece in 1710, and died on February 25th, 1723.

On the termination of the lecture, a vote of thanks was accorded to Mr. Macartney, on the proposition of Mr. Edmund Kirby, F.R.I.B.A., seconded by Mr. Blackburne.

GROWTH OF DESIGN IN WOODWORK.

Mr. E. Guy Dawber, F.R.I.B.A., delivered on Wednesday week last at the Carpenters' Hall, London Wall, E.C., a lecture on woodwork, one of a series instituted by the Carpenters' Company with the object of stimulating an interest in craftsmanship.

The use of woodwork in this country, he said, is more varied than in any other, and certain buildings erected by our ancestors are noted for the beauty and variety of their woodwork. He drew attention to the fact that Gothic woodwork is always of an ecclesiastical type, and that a marked similarity exists between the details of stone and woodwork, for in those days the simple pattern of the stone mason did very well for the carpenter. Their timber roofs exhibited a fertility of design and variety of construction truly amazing. Taking the various types of roofs, he enumerated the king-post roof with its two rafters, tie beam, king-post and curved braces; the hammer-beam, typical of the eastern countries; the trussed rafter roof, and the wagon roofs of the West of England. These types were illustrated by characteristic examples. Amongst them, and especially noticeable was an interior of a barn at Harmondsworth, Middlesex (from a sketch by the lecturer), with side aisles, also the roof over Westminster Hall, which he said was one of the earliest and was the most magnificent example in the country.

Passing on, he pointed out the resemblance to stonework of a wooden screen at Cambridge. The use of timbering for the construction of buildings was very common, and, in the parts of England where timber abounded, was always adopted. The filling-in only was of brick, or other material. Where we find the timber uprights placed close together, we may take it as evidence of old work, as in the later work the timbers are spaced more widely apart.

There are marked characteristics in the decorative forms of the timber-work of the West, as apart from the East. In the West, we find the curved braces (and other elaborate detail) which, it has been suggested, were caused through the oak trees being beat by the prevalence of the winds, and hence the distorted forms. Timberwork in the West is generally coarser and cruder in form than it is in the East, and Professor Blomfield attributes this to the influence of the Flemings. The treatment of floors and ceilings should not be overlooked. They were generally formed of large square beams, resting on wooden plates. These, filled in with plaster and wood, formed the ceilings, and a great many examples are to be found in Sussex. In other cases, the under sides were covered with boarding, and crossed ribs, the intersections of which were marked with carved bosses, bearing coats of arms, etc. Many bear evidence of having been coloured, a favourite treatment being gold stars on a blue ground.

Doorways were frequently the object of the craftsman's art. At first they were simply upright boards, studded with nails, and fixed to braces. Then, later, we find them decorated with tracery planted on to imitate the tracery of the windows. The doors of the 13th and 14th centuries were quite plain, and they relied on the beautiful wrought-iron hinges, which in some cases almost covered the doors, for decorative effect. Some delightful illustrations of doorways were shown, including porches at Oxford, and Wembley in Shropshire, also Moreton Old Hall.

Walls were usually decorated in one of three ways, either (1) by panelling, (2) by hanging the walls with tapestry, or (3) by painting. Before the sixteenth century, the panelling followed the Gothic style, the framing consisting of 4in by 3in. uprights, placed from 1ft. 6ins. to 2ft. apart, with cross pieces about 5ft. apart. The upper part of the panels was usually decorated with tracery, etc. The mouldings were carved on the solid, and this is the case at Haddon Hall, the mitres being simply masons' mitres. The panels themselves gradually became plainer and simpler, the monotony being broken up by pilasters, sometimes with semi-circular arches over. The first appearance of Classic detail seems to have been in the middle of the sixteenth century, in the reign of King Henry VIII., and it first shows itself in Wolsey's palace at Hampton Court. The screen at King's College, Cambridge, was shown, and the date of this could be definitely fixed between the years 1632 and 1636. The design, treatment, and detail, were thoroughly Italian in character. It was, however, an isolated example, and had no influence on the work of the time. After the Italian influence died out, we find the influence of the Flemings made itself felt. They seem to have favoured the East Coast, and although the general effect of their work was good, the details were crude and grotesque. Some of the finest specimens of the English type of work are to be found in the halls of our colleges, and in the large houses. Examples were shown, including Knowle, Kent, and Wadham College, Oxford.

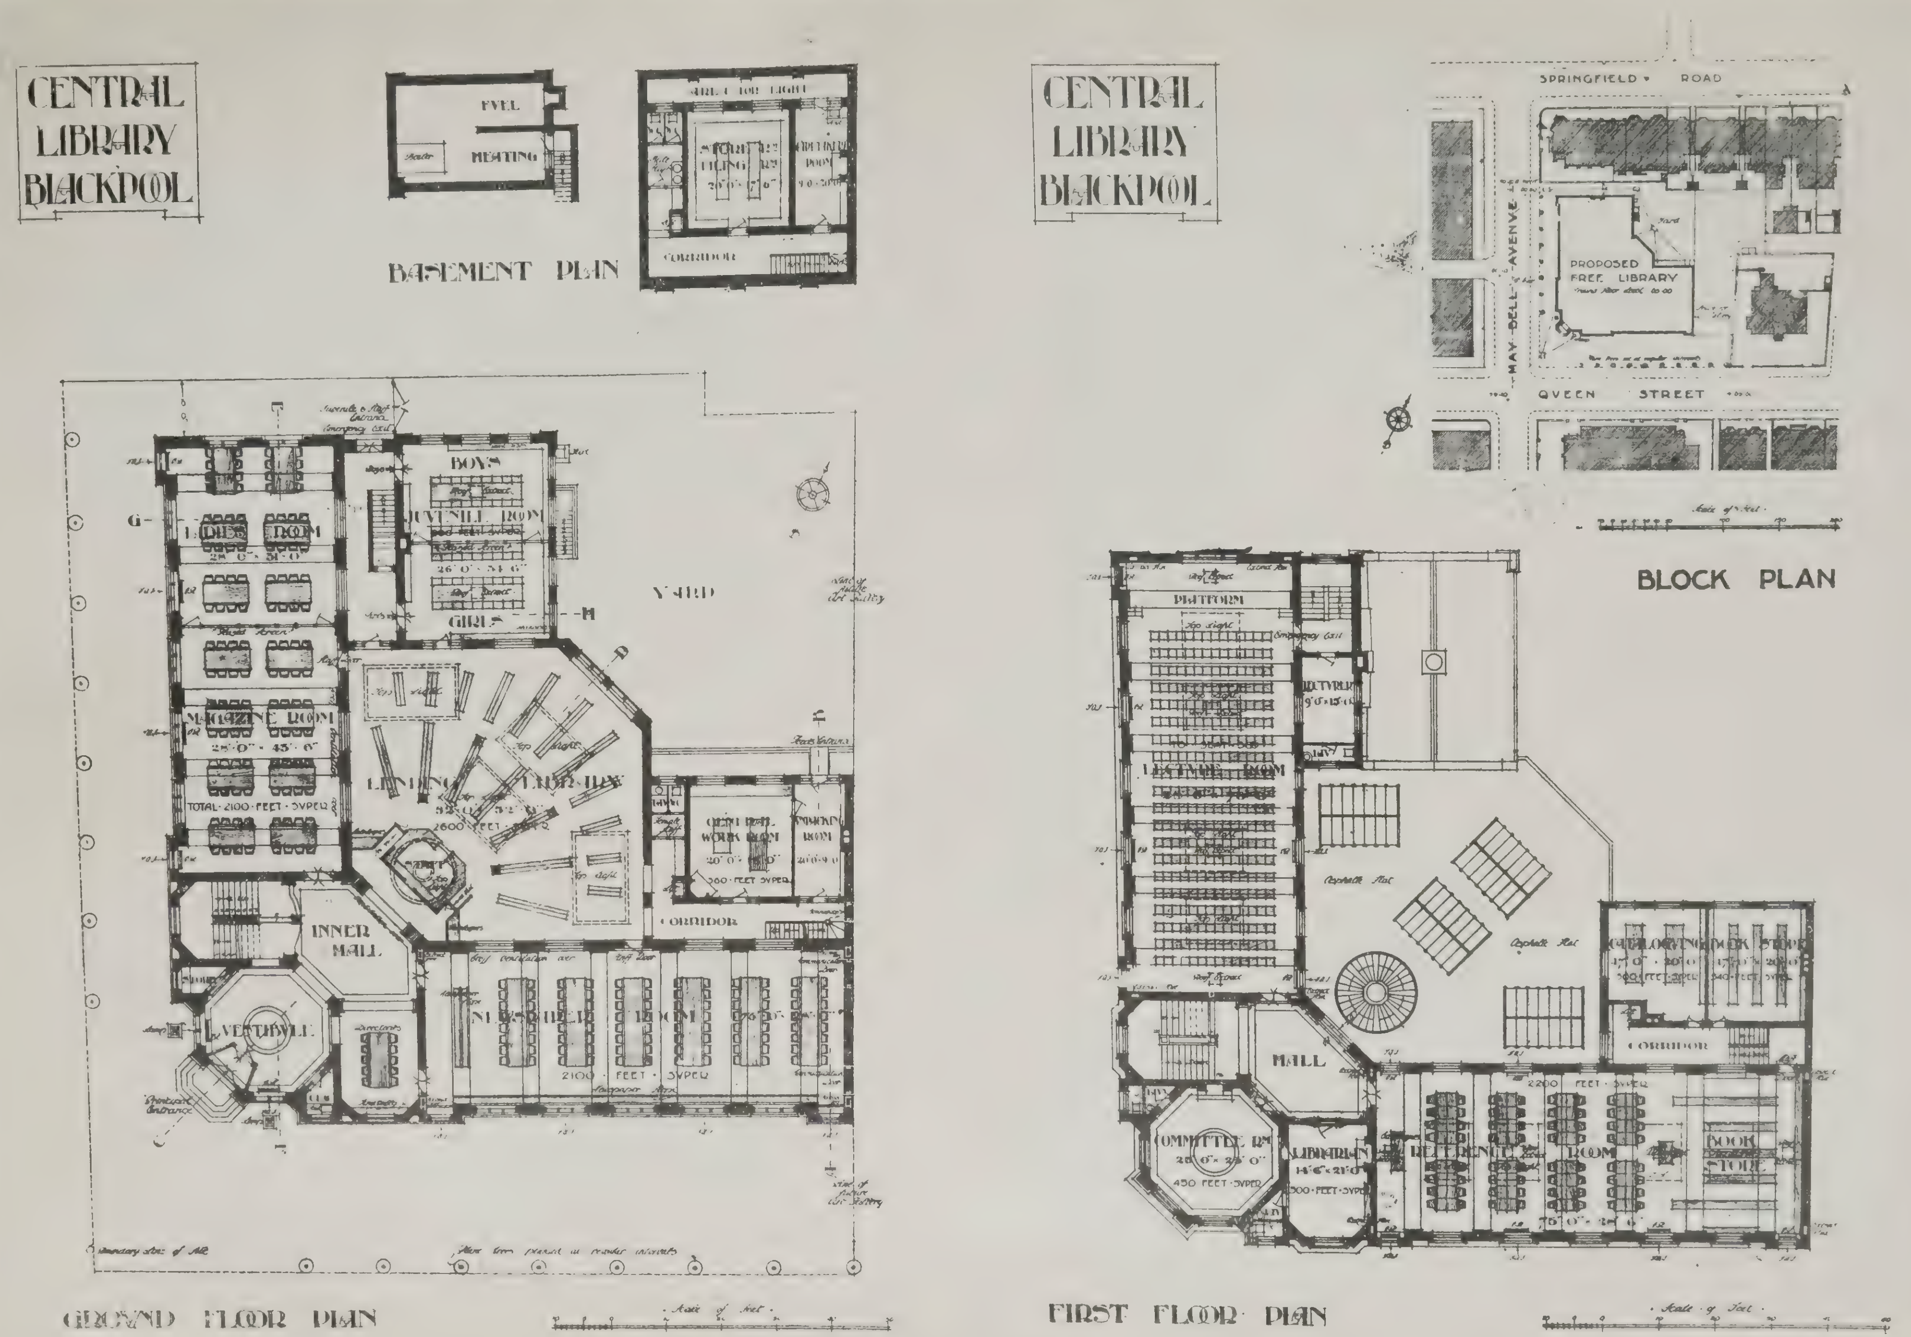
The commencement of the seventeenth century saw the last of the rich roofs and old ceilings, and plaster ceilings took their place. As the seventeenth century waned, the German influence died out.

With Inigo Jones came a broader and more scholarly type of design. The construction, though Classic in form, was admirable, and well suited to its purpose. The woodwork followed the architecture, and was part of it. Sir Christopher Wren gathered round him a school of craftsmen, and whether their work was in oak or deal, one style and one tradition permeated it. Types of this were shown, namely, choir stalls, etc., at St. Paul's, the Skinner's Hall, the Board Room of the New River Co.'s offices and the room from Clifford's Inn, now in the South Kensington Museum. Having briefly alluded to many other examples of this period, the lecturer said that in the beginning of the nineteenth century, and with the Victorian era, architecture was at its lowest ebb, and woodwork followed it. The two are inseparable; they always have been and always will be.

The German Emperor has conferred on Mr. John Singer Sargent, R.A., the Order Pour le Mérite.

* * *

In Mr. H. T. Buckland's paper on Schools, reported in this issue, it is stated that "Low pressure hot-water is still so dear to the hearts of many that one is loth to disparage an old friend, but it will, I think, generally be found difficult to obtain really adequate heating in conjunction with a proper air supply without resorting to some more rapid system of circulation." Messrs. J. F. Phillips and Sons, heating engineers, of 21, Old Queen Street, Westminster, and of Brighton, are at present installing in several schools the cable system of vacuum hot-water heating, which is a low pressure system, and the circulation of which can be worked at about 20 times the rate of the ordinary low-pressure systems.



BLACKPOOL CENTRAL LIBRARY COMPETITION: ONE OF FIVE DESIGNS BRACKETED FOR SECOND PLACE. C. H. POTTER, ARCHITECT.

PLANNING OF SCHOOLS.*

By H. T. Buckland.

(*Concluded from page* 140, No. 732.)

Ventilation.

If the planning of elementary and secondary schools does not present many points for great differences of opinion upon general principles, and in the main I think it does not, one has not far to seek for matter to provide quite adequate discussion. If I thought any heating engineers were present, I don't know whether I should have the courage to mention the word "ventilation" for fear of the discussion I might provoke. I want, however, to touch upon it from the point of view of the architect, and not of the expert. Of its importance there can be no question, since the only real departure from accepted methods of school planning owes its origin to a desire for a natural system of ventilation. I refer, of course, to the Staffordshire school already mentioned. The question at issue appears to be whether efficient ventilation can be secured for comparatively crowded rooms without the employment of mechanical agency.

Dr. Reid, the county medical officer for Staffordshire, maintains it can, others that it cannot. Whether each the mean the same thing by efficient ventilation is open to doubt, if we define it as "an adequate supply of fresh air of a proper temperature, admitted in such a manner as not to cause a perceptible draught." Sufficient movement to obtain a change of air in a room is the main essential in any system of ventilation, and whatever means may be employed must be directed to this end.

Dr. Reid's Contention.

In the case of the Staffordshire schools, the movement of the atmosphere is relied upon to effect the necessary change, and a through draft is facilitated by means of open windows on both sides of the rooms, in addition to a ventilation grating at the back of the heating radiators; the windows are so arranged with a hinged, glazed screen at the base, which, it is claimed, gives an upward direction to the entering air; and the same arrangement serves for exhausting the vitiated air, the window on either side acting as an inlet or outlet, according to the direction of the wind. Time will not permit me to go into all the claims made by Dr. Reid in support of the type of plan he advocates, his main contention, however, to quote from his report, is: "That if the central hall type of school is to be maintained, it is only by employing mechanical means that anything approaching adequate ventilation can be obtained, and even with such means the result is not satisfactory; and that the solution of the question is to be found in the plan which is described as the Staffordshire type." Whether such a plan as this is, as Dr. Reid claims, "quite compatible with educational requirements," is open to question. One central hall for three departments, of necessity, as was pointed out to me by a prominent educationist, does away with the morning assembly of two of the departments, and the need for a headmaster and mistress as such almost disappears if their personal intercourse with the children is reduced to a minimum. It is open to discussion whether such a sacrifice is worth making on the assumption that a satisfactory method of ventilation cannot be secured even by mechanical means in a school planned with the class-rooms round a central hall. Dr. Reid remarks: "All systems of mechanical ventilation, moreover, present a shocking object-lesson to the children from their inherent need for having all windows permanently closed." So far as the "Plenum" system is concerned this is true, and the argument is a weighty one against its use. Personally, I have found a majority of the teachers in "Plenum" ventilated schools adverse to it, and this is particularly the case with lady teachers.

The Plenum System.

Bearing upon this question, the opinion of Mr. Felix Clay, architect to the department, as recently given in evidence before a consultative committee appointed by the Board of Education, will be of interest:—"The 'Plenum' system has many strong supporters, who are able to show that, chemically, a fairly pure atmosphere is maintained by it. Mr. Clay, however, was strongly adverse to its use for school purposes. In the 'Plenum' system warm air is introduced under pressure into the upper part of the room; this being at a higher temperature than that already in the room, spreads over the ceiling, and being under pressure, produces a gradual downward movement, passing out of the room at the floor level. Certain objections to the system are the warming of the rooms by hot air only; this requires raising the incoming air to a temperature that seems to destroy some of its invigorating qualities and produces a somewhat enervating effect. Perhaps the chief objection is that, for the proper working of the system, it is absolutely necessary to keep the windows closed, and, in order to ensure this, the windows are not, as a rule, made to open; this has a very serious disadvantage in accustoming the children to sit in rooms with the windows shut." Any system which meets with such strong condemnation from different quarters will find it hard, I think, to endure. One has not far, however, to seek for an alternative, which appears to provide the advantages of a natural system with open windows, without necessitating the abandonment of the generally approved central hall type of plan, a system of mechanical extraction will, I think, be found to meet the case. Such a system is practically the reverse of the "Plenum"—the foul air being sucked out, and the fresh air drawn in, instead of the fresh air being pushed in, forcing the foul air out. This system was employed in the secondary and elementary schools at Rotton Park, previously shown. In that case, fresh air is admitted to the various rooms by means of gratings at the back of the radiators, and through the windows, in which the lower portions open as hoppers and the upper casements swing; the foul air is drawn from the rooms through a grating fixed in a riser extending the whole width of each classroom, this riser is in front of a duct which communicates with the main underground ducts all running to the extract tower, at the base of which are fixed two large centrifugal fans driven by electricity. In addition to the grating at the floor level, there is a small grating near the ceiling, at the head of a flue which communicates also with the underground ducts; this is for the purpose of drawing off the extra heat and fumes arising from the gas lighting. The whole of the windows may be kept wide open if required. No chemical tests have been made of the air in these schools, but so far as the evidence of the senses and the testimony of the teachers is concerned, I have every reason to be satisfied that it is such that both teachers and students find it stimulating and comfortable to work in. It certainly has the merit of being almost entirely under control. Doubtless satisfactory results have elsewhere been achieved by similar methods.

Methods of Heating.

Of the methods of heating at one's disposal, we now have many. Low-pressure hot-water is still so dear to the hearts of many that one is loth to disparage an old friend; but it will, I think, generally be found difficult to obtain really adequate heating in conjunction with a proper air supply without resorting to some more rapid system of circulation.

The various systems of forced hot-water circulation, although differing in method, all have the same end in view, viz., acceleration, and it seems obvious that the oftener you pass the water through your boiler the warmer you are likely to keep it, assuming your boiler can supply the requisite heat.

Atmospheric steam has been largely used of late years, and my experience of it in large buildings is certainly favourable, but my impression is that the tendency among heating engineers is distinctly in the direction of accelerated hot-water systems.

A weighty argument always advanced by the advocate of ventilation by natural as compared with mechanical means is the question of cost. Not only first cost, but also cost of maintenance. Ventilating engineers may have some reply to this; I have none, except that if efficiency is required it will need to be paid for. As regards the question of first cost, Mr. Clay, in the evidence already quoted, estimated the cost of installing the "Plenum" system at from £1,500 to £2,000 in a school of 1,000. I am inclined to agree with this, if the figures quoted represent the cost over and above a natural system, i.e., to say I consider the "Plenum" system adds from 30s. to £2 per child to the cost of a school for 1,000 children. A system of mechanical extraction such as I have described, adds less, as the size of the ducts does not require to be so great, or the finish so good as in the case of the "Plenum." This naturally brings us to the whole question of cost of school buildings.

The Question of Cost.

My own experience is that an elementary school cannot be built for a reasonable number, say, from 750 to 1,050, at less than £10 per head; and to achieve this the site must be level and have a good foundation. The school at Acocks Green, which was shown, will cost, I understand from the architect, rather less; probably not more than £9 15s.; but this is an exceptionally large school, and has classes each for sixty children. One education authority in the Midlands which has promoted several recent competitions, allows £14 per head; for this, I think, a very decent school may be expected, if no mechanical system of ventilation is required. Of course, a good deal depends upon whether a school is in two or three departments. Ten pounds per head for a three department school is very low.

The Staffordshire schools in three departments, but with only the one central hall, cost £10 10s 4d. per head.

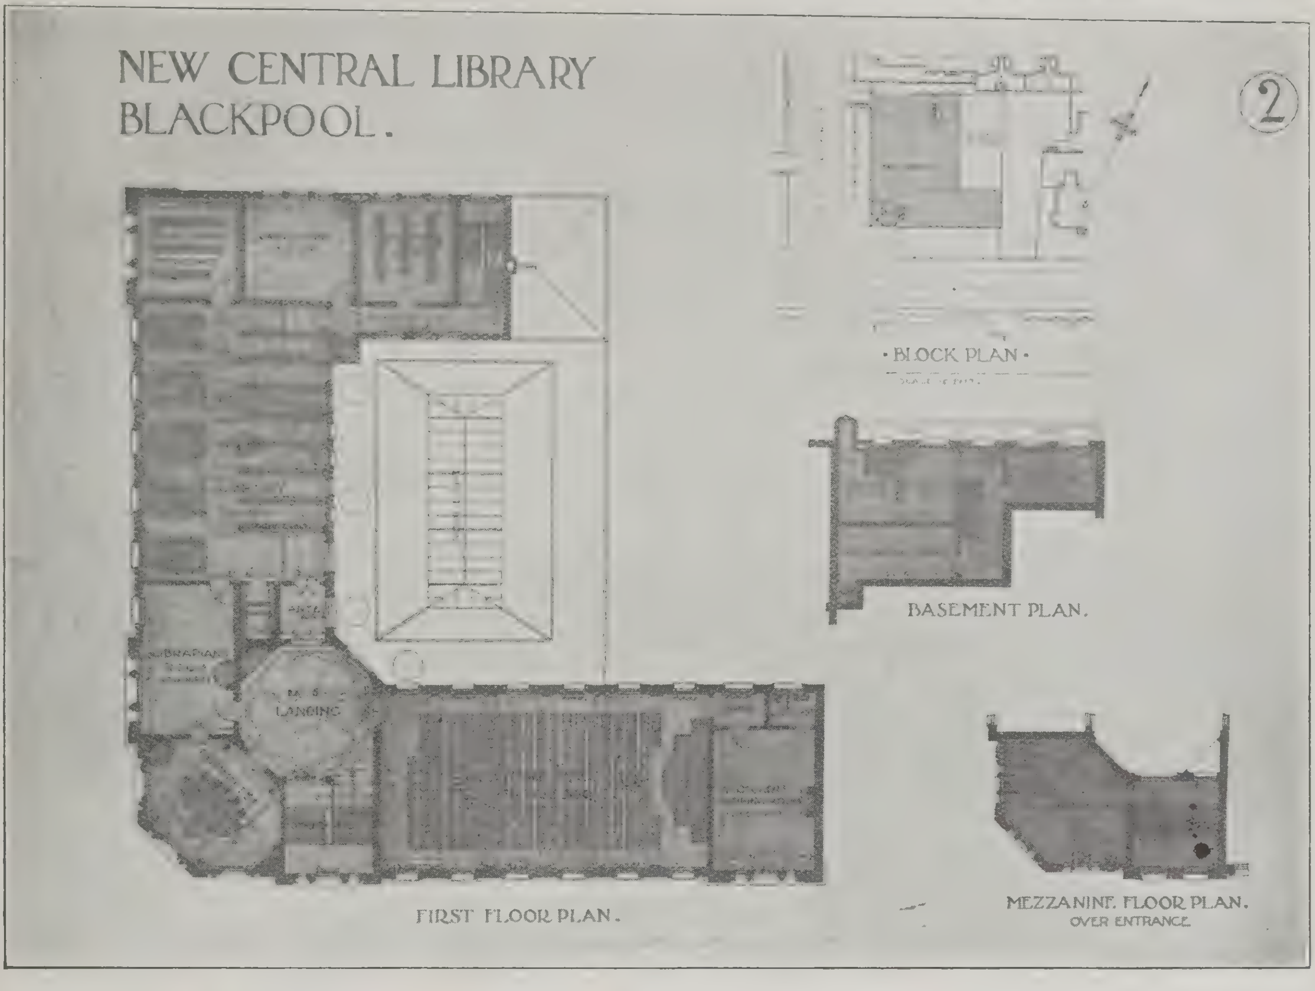
Of "Plenum" ventilated schools I know of one in two departments which cost £15 per head. A really well-built school with three departments and three central halls, a mechanical system of ventilation, and some regard to an architectural treatment in design and materials, cannot, I think, be built for much less than £17 per head For that amount boundary walls, 14in. thick, or walls and railings all round the site, and a caretaker's house, may be expected to be included.

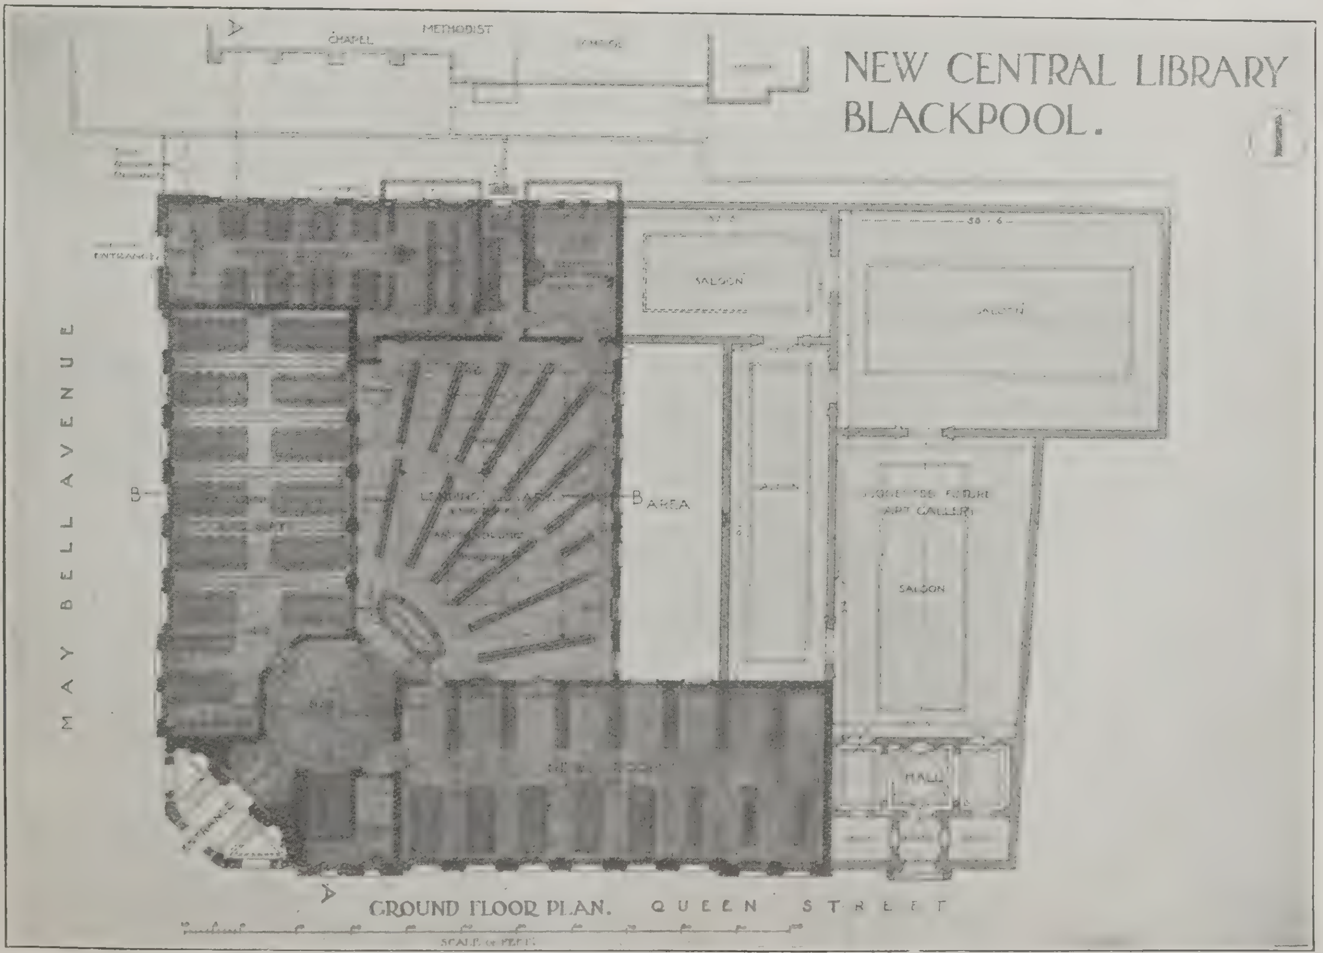
Cost Per Foot or Per Head.

These figures represent prices per foot cube, ranging from 5½d. to 7d., and as boundary walls and play-grounds are included in the prices mentioned per head, these items have to be priced separately and added in making up an estimate. In discussing the cost of secondary schools, I find myself at variance with the accepted method of pricing at per head. In elementary schools, given a certain number, there will not be much variation in the size and number of the rooms; but in a secondary school, although the number of class-rooms and children accommodated may be the same, the rooms for what I have called special instruction may vary considerably. Education authorities seem to lose sight of this fact, and in some cases invite plans in competition, stipulating for extra large laboratories and art rooms, swimming baths, and many other things which do not form part of another school upon which they base their price per head. Thirty-five pounds is a favourite figure to quote, but a quite insufficient one unless the accommodation in laboratories, art rooms, dining-

---

*Extracts from a paper read by Mr. Herbert T. Buckland before the Architectural Association, on February 5th. The first portion of the paper, dealing mainly with elementary schools, was given in our issue of February 10th, p. 113. The second part appeared last week.





BLACKPOOL CENTRAL LIBRARY COMPETITION: ONE OF FIVE DESIGNS BRACKETED FOR SECOND PLACE, COOPER AND SLATER. ARCHITECTS.

rooms, gymnasium, etc., is kept within modest limits.

Of the plans I have shown, the school at Bishop Auckland, by Mr. Reynolds, is estimated to cost £1,500, and for the one at Bromley, by Mr. Burke Downing, the sum of £8,000 was mentioned in the conditions of competition. The accepted estimate for the schools at Barnsley was £18,672. Of the schools at Rotton Park, I am unable to separate the cost of the secondary portion, as this and the elementary school were all in one contract. From 6d. to 7d. per foot cube will, I think, be found reasonable working figures, with further allowance for playgrounds and boundary walls.

At the conclusion of Mr. Buckland's paper, Mr. Osborne Smith proposed a vote of thanks to the author, and said that the paper had really covered an astonishing amount of ground in a short space of time. Many points in the paper were tolerably new to Londoners, who, perhaps, were unaccustomed to the building of schools in one storey only. He recognised the difficulties of the architect confronted by the problem of satisfactorily ventilating a school that had classrooms on each side. A great deal, he believed, rested with the teacher, who almost always preferred the windows closed. In regard to the question of aspect, he was inclined to think a south-east aspect the best, but the matter was more or less one of sentiment.

Mr. Fleming, in seconding the vote of thanks, commented upon the movement in the direction of open-air schools. He believed there were about six in Germany; and London had imitated the example by erecting its first open-air school at Plumstead. This consisted of sheds open on one side only. Last year saw the establishment of three open-air schools, and this year would probably witness further developments. If medical officers intended developing the idea of much fresh air in classrooms, it meant a new type of school altogether, more especially in London, or the great manufacturing cities of the north, where impurities of atmosphere would have to be dealt with. In Germany, every school had its gymnasium, and it seemed to him that there physical education was more scientifically studied than in England. He had seen classes of both German and Swedish scholars, and he had to admit their decided physical superiority over London children. This would involve the alteration of many grave defects in the present design of school. In Munich, Stuttgardt, or Stockholm, schools were to be found well worth careful study in all their details, from the point of view of comfort, as well as of artistic treatment. The amount of money allowed for the erection of English schools did not bear comparison with that allowed for Swedish schools, in which from £20 to £30 per head was permitted.

Mr. Herbert T. Buckland briefly replied.

Contributed by Mr. T. J. Bailey, F.R.I.B.A.

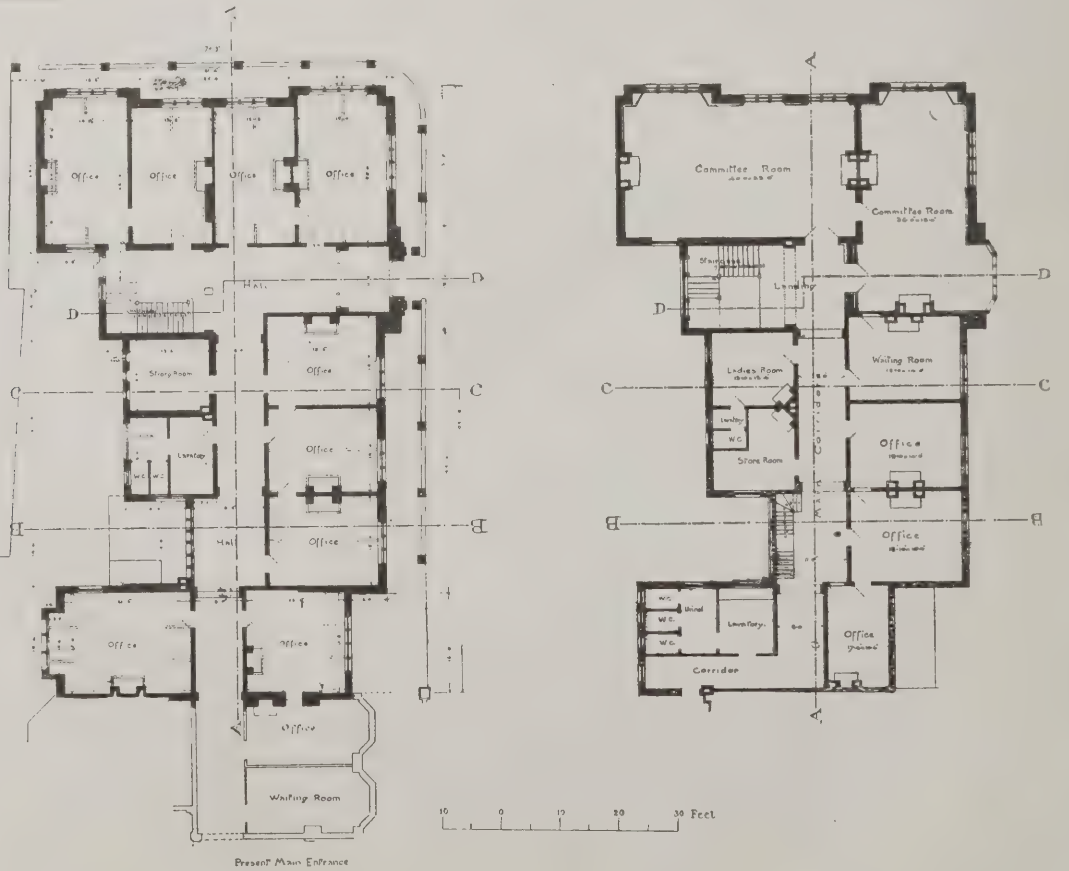
Mr. T. J. Bailey sent the following written notes on the paper, which were read at the meeting:—

Special Requirements.

Mr. Buckland only deals with two kinds of school: the ordinary elementary type and the secondary school. To make the subject complete, I should have expected some reference, at any rate, to be made to the higher elementary type on the one hand, and the schools for mentally and physically defective, of which there are several requirements, on the other. To take his remarks on the elementary school, he naturally begins with the sites; as his remarks evidently only refer to large schools in towns, it is manifest that the Educational Body has very little choice. It is not always possible even to obtain the 30 ft. of unbuilt-upon playground space which is regarded as a minimum by the Code of the Board of Education. In London, at any rate, considerations of rehousing obligations operate largely in the choice of a site. In the paper I read at the R.I.B.A. some years ago, I gave my observations on this subject, and can only repeat that the only ideal site is to be obtained in a not altogether built-upon suburb. No doubt the Board of Education is right in laying down the axiom that a three-storey type should not be followed if space allows for the buildings to be one of two storeys high. The question of the desirability of a central hall has gone beyond the line of argument, and also, I am glad to say, has the question of whether each department should have its central hall, or whether there should be one common to two or three departments. As the hall takes the place of a corridor, giving access to the various rooms, it is obvious that great confusion would ensue if the hall was used by another department than that to which it was attached, and, if built as a separate block, each department would need corridors and connections with the hall, thus rendering the cost prohibitive.

Infants' and Mixed

In a school of the size referred to in the paper, viz., 1,000 to 1,200 children, the point raised as to its being built as a two-department school—infants and mixed—is worth notice. It would not do to provide more than about 380 infants, and this would give a mixed department of 700 or 800, manifestly too large. The mixed department would, therefore, have to be divided into two, senior and junior, probably under one head-teacher—preferably not. In large towns the position of the school with regard to the social position of the families supplying the children would probably determine the question of mixed or separate departments—the lower the grade, the more danger in mixing. With regard to the sizes of the class-rooms, the lecture appears to favour classes of from 50 to 60. In the paper I referred to, I dealt with that subject, and am glad to be able to say that all new schools and alterations to old ones in London under the County Council have a unit of 40 for the class rooms, any variation of that being in favour of a smaller number, 30 or 35, in the graded departments, and not exceeding 50 in the infants; and I would here emphasise my view, expressed at that time, that no seats should be more than 20 ft. from the window wall, and I wish the



Ground Plan.

First Floor Plan.

EXTENSION OF EAST RIDING (YORKS) COUNTY COUNCIL OFFICES, BEVERLEY. B. S. JACOBS, F.R.I.B.A., ARCHITECT.

Code would be altered accordingly; for elementary schools it is equally as important as secondary. Mr. Buckland makes no reference to the desirability of providing any other rooms for teaching purposes than the ordinary class rooms. In my opinion, and with the experience I have gained in building the schools of London and 25 years, I consider it very desirable that there should be a room for general science—not advanced work—and also a room for art teaching in the boys' departments, and rooms for teaching domestic subjects in the girls' departments, and I would have these attached to all schools; also a room apart from the main building in the boys' department for manual training work in wood or metal, or both.

I am afraid the

Remarks on Secondary Schools

do not give much guide to either the requirements or the points of planning, but I would remark concerning them: (1) The number to be accommodated, Mr. Buckland knows of no recent secondary school which accommodates more than 400 in one department. I am building five secondary schools for girls in London, accommodating upwards of 500 in each, and I certainly do not agree with him that a *central* hall is not the best arrangement—with nine class rooms, or more, on a floor, it is surely better that they should discharge into a large hall than into corridors, and it is manifestly the cheapest arrangement for building, and I can answer for it that there is not only no inconvenience, but it is appreciated. There are many requirements in secondary schools which are touched upon, but the variety of subjects taught and the needs in such an eductaional establishment need more than a passing reference. As regards the number of departments in a secondary school, it is best that, in large towns, they should be built as separate schools; of course, in country districts, combined schools may be desirable, having regard to the smaller numbers to be provided for.

Finally, and the only matter the lecturer touches upon in detail—on

The Question of Ventilation

—the remarks are all a criticism of the Plenum system, and, as I understand it, a condemnation of it. This I cannot agree with. In my opinion, a really good modern installation on this type is the best that can be had, but there are so many prejudices against it, that public bodies hesitate to adopt it on this account. I have installed it in five or six cases some years ago with great success. I have also installed it where it has been continually complained of. If I were to instal it in a building now, I would only have it in operation in the winter—but the extra cost on the building for ducts and flues renders the cost prohibitive where there is a desire to keep down the cost of a building to the lowest point. Experts favouring both systems would argue the respective merits for a week, and would probably leave the hearers confused and unconvinced. I can only speak from my own experience. A head-teacher told me the other day in a school where the Plenum system was instal'ed 10 years ago, that in foggy and frosty weather they are practically in the Riviera, and I have never heard any complaints from that school that the windows could not be opened in the summer. As regards the system of warming by low pressure hot-water as compared with steam, it is well to remember that the latter probably means the employment of an engineer for working it in the winter, as it is too dangerous to entrust to the ordinary schoolkeeper, with his multifarious duties about the school, whereas the former can easily be attended to by him.

In his remarks on

Sanitary Accommodation,

Mr. Buckland refers to automatic flushing. This means troughs, which are pretty universally condemned by the faculty in these days. Besides, all towns have their sanitary by-laws, and I doubt if any at the present time would approve these, certainly not in London—it is surprising news to me that even in a single case independent flushing "was not satisfactory, and an automatic system had ultimately to be installed." It would be interesting to hear where this occurred. The reverse is my experience, and is the cause of constant disputes with Borough Councils in the case of old schools which are working satisfactorily.

Areas of Central Halls.

The general remarks touching lighting, desking, etc., are truisms which need no comment, but I would like to place on record my opinion that the requirements of the Code as to the areas of central halls, viz., a minimum of 6 ft. per scholar in secondary schools, and a maximum of 4 ft. in elementary schools, is incomprehensible, especially considering that in a properly equipped secondary school there is a gymnasium and dining room in addition.

INFLUENCE OF MATERIAL ON WOODWORK DESIGN.

Mr. F. D. Troup, F.R.I.B.A., lecturing at the Carpenters' Hall, London Wall, E.C., observed that as an artist speaks with his brush, so, even more, does a craftsman, by means of his hammer or chisel, express his thoughts through his work It is very seldom, he said, that we find a true working craftsman, who has an intimate knowledge of his craft, and at the same time a fluency of expressing himself to others. Proceeding to the consideration of

Timber Houses.

these, he said, are of two kinds—there are the "half-timbered" houses, as they are called, of our own country and of France; (2) those of Norway and other northern countries, which are built entirely of solid logs, and are called "whole-timber" buildings. Some slides that were here shown demonstrated very clearly the contrast between the châlets, or log houses, and the half-timber work of England and France, and included examples from Switzerland, Bayeux in Normandy, and Speke Hall in Cheshire. These two methods of construction, the lecturer said, are absolutely different, and have developed entirely different designs and entirely different methods of ornamentation. By design, he implied the whole construction of the building, and not merely the ornamental treatment. In the case of the Swiss châlets, the method of construction was as follows: The walls are built of straight timbers, sometimes of the length of the house. Each log has the top and bottom sawn off so as to present a flat surface, and these logs are placed one on the top of the other, with a layer of dry moss between each, instead of mortar. At the angles of the building the logs are notched into one another. In some cases the two sides of the logs were sawn off, so as to present a level surface on both sides, and this is usually found in the modern work.

Concerning Roofs.

The lecturer said that here we have a good instance of the way in which the material influences the design. The wooden walls, if they are to last, must be protected from snow and rain, and so we find in the Swiss houses, big projecting eaves, supported by brackets, which not only keep off the wet, but afford good shade in the summer. The roofs are of very low pitch, and on this account the snow remains on them and helps to keep the house warm. They are usually covered with shingles, on which are placed large stones to prevent the wind getting underneath and moving them. There are no valleys, and the roof is kept as simple as possible, usually in one span covering a square building.

English and French Half-timber Work.

In England and France, the timber used is neither so long nor so straight as the Swiss pines, and so a different method of construction is adopted. A wooden sill is laid after the Swiss fashion, and on that a framework is raised, mortised and tenoned with braces formed of the curved branches to enable the carpenter to get his tenons right, both at the sill and at the corner post, which it supports. As a protection against the weather, we often find the upper storey projecting. This is effected by shooting out the floor joist over the wall that carries them. When the projection occurs on both front and side of the building, we find a diagonal beam into which both joists are tenoned. This beam supports the angle post over, and is itself supported by a bracket, formed of the root of a tree inverted, and sometimes elaborately carved. Many beautiful examples of both French and English work were shown, and the lecturer drew special attention to the fact that in France we find very little curved work, the braces are usually straight, while in England they are frequently curved. This difference can very likely be accounted for, he said, on considering that English oak consists of big limbs and curved branches, while in France it is both straighter and heavier. The lecturer next gave a description of a house in Norfolk, to which he had recently made some alterations. A peculiar point to be noted was that the timbers of which the house was constructed did not show at all on the outside.

Woodwork of the East.

The lecturer then proceeded to point out the chief difference between our treatment of woodwork and that of the East, where, generally speaking, large pieces of wood were carefully avoided, the panels of doors, for instance, being divided up into small pieces. Numerous excellent examples were shown on the screen, of work from Cairo and elsewhere and these, he said, could be supplemented by examples from China, India, and Japan.

The Pitfall of the Designer on Paper.'

In conclusion, he said, you ought to be able to tell from the apppearance of a well-designed thing whether it is made of soft wood or hard wood, and the pitfall of the paper-designer is that he does not sufficiently understand his materials. When in doubt, the designer should pay a visit to our museums and study the old examples; but construction must come first. By construction he meant the whole treatment of the material; and the tools used, and the craftsmen who executed it, must be taken into the account. It is wise to take the craftsman into your confidence, and modify your design to suit him—or perhaps, and better still, get him to modify it for you.

Architect as Craftsman.

The lecturer next gave a word of advice to young architects. You have been told, he said, from this platform to get to the bench. This may seem impossible, but you may be sure that if you learn one craft, it will give you an instructive insight into all the others. Do what is constructively right. and true to the material you are working in, the result will be the best you can do, and no one can expect more of you.

With respect to the designing of buildings by official architects, "An Architect and Ratepayer" writes to the Manchester "Daily Dispatch":—"Is it to the advantage of the ratepayers that all their building works should be designed by the Corporation officials in the Town Hall? It certainly does not give our local architects a chance of showing publicly their skill in the designing of buildings. When our city architect was appointed, it was understood that his duties would be to advise the Council upon all plans deposited, especially with regard to the elevations fronting improved streets, and so give the city some pretensions to architecture. Then why should local architects who are ratepayers be deprived of submitting designs in competition? There is no reason why architects should not be asked to compete just in the same way that builders have the option of tendering for public work. My opinion is that not only would buildings be erected cheaper and better, but architects and their assistants would be found employment in these days of bad trade." With much of this contention we quite agree.

Proposed New Works.

BARNES.—The U.D. Council has approved plans for the following:—Conversion of houses into shops and the erection of bakehouse, Nos. 46, 48, 50, 52, 54, 56, Lower Richmond Road; ten houses, Blind Lane, Messrs. Tyars and Jago; three houses, Beverley Path and Brookland Avenue, Messrs. Tremain and Tolkein.

BEXHILL.—The Town Council have approved plans for the following:—House in Collington Avenue, Messrs. Moon and Garner, owners, Mr. J. B. Wall, architect; house in Collington Avenue, Messrs. Moon and Garner, owners, Mr. C. W. Spencer, architect.

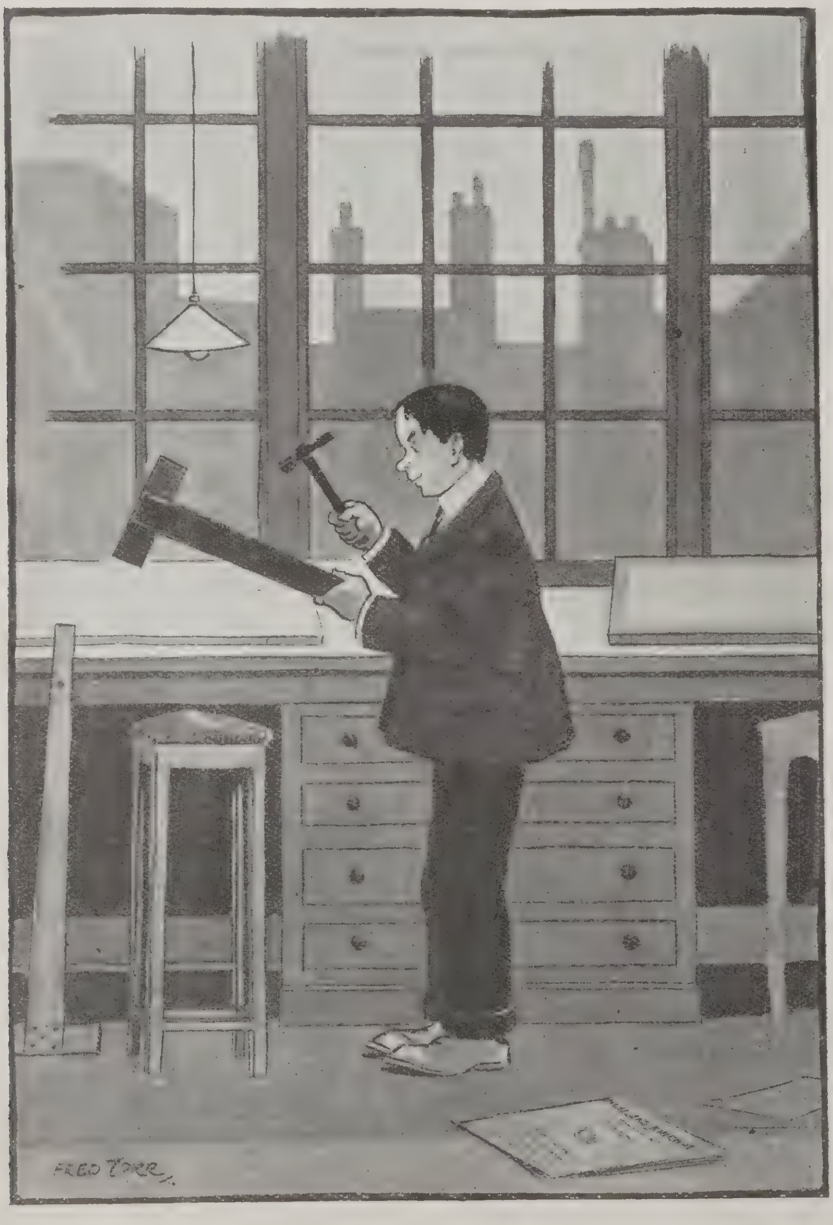
CHATHAM.—The Town Council has approved plans for the following:—Bungalow at Walderslade, for Mr. A. E. Templeman; two houses, for Messrs. A. H. Hastings and C Day; 26 houses, at Beaconsfield Road, for Mr H. P. Hughes; new premises in Luton Road, for Mr. C. E. Skinner.

ENFIELD—The L.G. Board have sanctioned the borrowing of £9,750 for enlarging the Southbury Road Council Schools.

GLASGOW.—The Dean of Guild Court has granted permits for the following:—The Overnewton Building Company, to erect six tenements of dwelling-houses in Nairn Street and Esmond Street; John Philip, builder, 87, Union Street, to erect 15 terraced houses in Crown Road, Jordan Hill; the Mount Florida Bowling Club (Limited), to erect a bowling green club-house in Carmunnock Road; Appleby's (Limited), Crane Works, Rigby Street, Parkhead, to erect an extension to their works there.

GOSPORT.—A new Soldiers' Home is to be erected on a piece of Government land, adjacent to the railway station. The new building is to be similar to the Sailors' Home, Queen Street, Portsea, with a large number of cubicles, and billiard, recreation, and reading rooms.

HORNSEY.—The Town Council has approved plans for the following:—Two dwelling-houses in Causton Road, Highgate, Messrs. Fedrick Bros., of Cholmeley Park, Highgate; four dwelling houses in Creighton Avenue, Muswell Hill, Mr. C. Tucker, of Page's Lane, Muswell Hill; dwelling-house in Cholmeley Park, Highgate, Mr. W. Houghton, No. 24, Weston Chambers, Southend-on-Sea; 13 dwelling-houses in Cholmeley Park, Highgate, Messrs. Fedrick Bros., of Cholmeley Park, Highgate, N.



"Then George Street, Norman Shaw, and Eden Nesfield showed how much of the real qualities of a building could be expressed by line. One incident of the time was the discovery that one of these masters used a notched straight-edge, thereby admirably rendering the texture of roofs I confess to having sacrificed a T-square myself in that cause."—*Mr. Ernest George's address to the Students.*

THE NEWEST JUNIOR IN ONE PROVINCIAL OFFICE FOLLOWS IN ILLUSTRIOUS FOOTSTEPS.

NORTH SHIELDS.—The Trades Commerce Committee of the Tynemouth Town Council are considering two schemes for the extension of the Fish Quay. One scheme, providing over 1,000ft. of additional quay frontage, is estimated to cost £24,000, the other with 691ft. of quay frontage would work out at about £13,000.

SELKIRK.—The School Board are considering various schemes for reorganising their school accommodation, made by Mr. John Hall, architect of Galashiels. The rebuilding of one or enlarging of other schools will probably be required.

WHITEHAVEN.—The Town Council have approved plans for the erection of a new elementary school in Irish Street at an estimated cost of between £9,000 and £10,000.

Works in Progress and Completed.

BLACKBURN.—The extension of the Blackburn and East Lancashire Infirmary, at a cost of more than £5,300, has now been completed. Messrs. Simpson and Duckworth, of Blackburn, were the architects, and Messrs. W. J. W. Cronshaw and Sons, Blackburn, the contractors

BRISTOL.—The new church of St. Ambrose is in course of erection, at a total cost, when completed, of about £12,000, but at present the tower will not be proceeded with. The building, which is to seat 700, will be of local stone, with Bath stone dressings and roofs covered with Broseley tiles. Messrs. W. V. and A. R. Gough, Bristol, are the architects.

CLYDEBANK: RADNOR PARK.—Messrs. Robert M'Alpine and Sons are about to erect 36 houses of two-storeys each. Eighteen are to be of two rooms and kitchen, and eighteen of one room and kitchen; all with baths and garden plots in fronts.

HAMILTON.—The public baths and wash-houses have now been completed at a cost of £11,000. The new buildings comprise offices, waiting-room, swimming pond, slipper and spray baths, club-house and wash-house of eight stalls. The swimming pond is 75ft. long by 35ft. wide, and the pond hall has galleries providing accommodation for nearly 700 spectators. Mr. W. H. Purdie, the Borough Engineer, was the architect.

LEEDS. — The new church of St. Margaret's, Cardigan Road, erected from the designs of Mr. Temple Moore, London, has now been opened. Messrs. H. Atkinson and Sons, Leeds, were the contractors.

OXFORD: SUMMERTOWN.—The new church of St. Michael and All Angels is now in course of erection. The church, when completed, will accommodate about 1,000 people, at a cost of about £13,000; but at present only a portion of the building, to hold 600, is in hand; this first portion costing £7,866. Messrs. Wooldridge and Simpson are the builders, and Mr. A. Mardon Mowbray, the architect.

ST. ALBANS.—The tender of Messrs. John Bentley and Sons of Waltham Abbey, at £7,324, has been accepted for the erection of the new church of St. Paul. Messrs. J. E. K. and J. P. Cutts are the architects.

SETTLE.—A new infectious diseases hospital has been erected by the Rural District Council at a cost of about £6,500.

TOTNES.—The new workhouse infirmary has been completed. The total cost will be £8,500. Messrs. Petherich, of Plymouth, were the contractors, and Mr. W. F. Tollit, of Totnes, the architect.

WHITEFIELD.—A new secondary school, to be known as the Stand Grammar School, is to be erected by the Lancashire County Council, at a cost of £17,357. Mr. H. Littler is the architect.

WINCHESTER.—The new County Council offices, designed by Mr. J. Taylor, county surveyor, and approved by Mr. T. G. Jackson, R.A., are to be proceeded with at once. The total cost, including furnishing, is estimated at £20,000.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Mar. 1.	TORRINGTON (DEVON). Memorial Cross. The Committee of the Rolle Memorial invite designs for a memorial cross (preferably of granite), to be erected in the churchyard, Torrington. Cost, inclusive of erection, &c., not to exceed £100. Premium £2 2s. for the selected design, but no other charge or expense. Particulars from George M. Doe, Town Clerk, to whom designs are to be sent.
Mar. 8.	*PONTARDAWE (WALES). Offices for the Guardians, in Holly Street. Premium £10 10s. The premium is offered by the Guardians "for plans with abridged specification, *which in their judgment* are best suited." Particulars and conditions from C. B. Jenkins, Clerk, Herbert Chambers, Pontardawe, S.O., Glamorganshire.
Mar. 17	†NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3,500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council, Stanley S.O., Co. Durham.
Mar. 31	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days
April 10.	BOLTON BRANCH PUBLIC LIBRARIES. The Libraries Committee of the Corporation invite competitive plans from architects who have been principals in the County Borough of Bolton six months prior to the present date for Branch Public Libraries to be erected in the districts of Astley Bridge, Halliwell, and Gt. Lever. The plans and particulars may be obtained from Samuel Parker, Town Clerk, Town Hall, Bolton. Deposit, two guineas.
April 12.	ELLAND NEW SECONDARY SCHOOL. Architects having offices and practising in the West Riding of Yorkshire are invited to compete for the work in connection with the new Secondary School at Elland, and should apply for particulars to Mr. Leonard Clegg, Holiwell Green, near Halifax.
July 31.	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	BOURNEMOUTH BRANCH PUBLIC LIBRARY. Architects practising in the County Borough of Bournemouth are invited to submit designs for a new Branch Library at Boscombe. Particulars from Charles Riddle, Borough Librarian, Central Library, Bournemouth.

*We are advised by Mr. Jenkins that the supply of particulars and sketch plans is exhausted and no further applications can be entertained.

† The Royal Institute advises members not to compete.

Girls' Secondary School, Romford.

The premiated designs for the above were on view from 10 till 6 on Saturday, February 20, at Albert Road School, Romford.

Laying Out Estate at Oswaldtwistle, Blackburn.

Mr. Alfred Smith, hon. secretary of the Lancashire Federation of Small Holdings Associations, informs us that the competition for the above was closed a fortnight ago. Unfortunately, the competitors had made so little use of the existing roads, and had consequently proposed so many new roads, that none of their schemes were practicable. The Small Holdings Committee of Blackburn have therefore adopted a plan prepared chiefly by a member of the committee and the borough engineer. They awarded the three prizes of £25, £10, and £5 to the three competitive schemes which seemed the least impracticable.

New Grammar School, Barnsley.

In the competition for the above school (for the governors of the Barnsley and District Holgate Grammar School), Mr. A. W. S. Cross, M.A., F.R.I.B.A., has been appointed assessor in conjunction with Mr. A. Houghton, the county council's chief inspector for higher education.

THE CONCRETE INSTITUTE.

The Commercial Aspects of Reinforced Concrete.

By Lucien Serraillier.

The lecturer began by stating that the relation which subsisted between (*a*) the client or principal, (*b*) his technical adviser, and (*c*) the contractor in ordinary civil engineering and architectural construction was more complex in reinforced concrete construction, whilst the recent advent in England of firms which were endeavouring to popularise this particular industry had further intensified the complexity of this relation. The present paper was an attempt to define the duties and responsibilities towards each other of the various parties engaged in this class of construction, to explain the conditions which govern its exploitation, and to determine between (*a*) the principal or engineer and architect, (*b*) the specialist firm which confines itself to this branch of construction, and (*c*) the contractor, an equitable relation which should, as far as possible, conciliate all interests and eliminate those injustices which now unfortunately arose, undoubtedly through ignorance of those peculiar conditions rather than through intention.

The principal, or his technical agent the engineer or architect, hereafter called the client, had two methods at his disposal under which reinforced concrete work could be undertaken: (1) He might design the structure himself, and either confide the work to a contractor under his supervision or else carry it out himself with his own gang of men; (2) he might entrust the design to a specialist firm, and either carry it out himself with his own men, or with his own contractors, or else get the specialist firms to do it themselves or through contractors selected by them.

The first method was the usual practice adopted in general civil engineering and architectural construction, whereas the second method might be said to be peculiar to reinforced concrete, although sometimes adopted for steelwork. The technical and practical difficulties of the reinforced concrete industry were of such a special nature that the client generally preferred to employ a specialist firm, to whom he thus delegated his duties and responsibilities, contenting himself with a secondary control.

Division of the Work.

Reinforced concrete work might be subdivided into—1, the design; 2, the execution; 3, the reinforcing material employed (as also other materials of construction which do not concern us in this paper). In ordinary construction, matters were simple enough, because the engineer or architect who was the designer of the work assumed control of its execution, and was responsible for such, although any mistake on his part affected his reputation, but never his pocket. In that case the designer not only controlled the contractor, but indirectly, through the latter, also controlled the merchants who supplied the material; he had the right of rejection, and in virtue of the fact that he held the purse-strings his power was supreme. In reinforced concrete, matters were not so simple, for where the designer was a specialist firm, it was the engineer or architect who then became the principal or client, and the specialist firm assumed his duties and responsibilities, and certain additional responsibilities into the bargain.

The Intrusion of the Specialist Firm.

The point which concerned them in the paper was the case where the assistance of a specialist firm was called in either by the client direct or through his technical adviser. There were two categories of specialist firms—(A) those which derived their profits from the exploitation of a patent system of construction, and (B) those which derived their profits from the exploitation of a patent form of reinforcing material. The firm which exploited a patent system of construction combined divisions 1 and 2, previously referred to—i.e., the supply of the design and its execution. The execution was generally carried out by contractors specially licensed by the specialist firm, whose work was approved by the latter. On the other hand, the firm which exploited a patent form of reinforcing material combined divisions 1 and 3—i.e., the supply of the design and of the necessary reinforcing material. In this case the execution was generally tendered upon by non-licensed contractors, with sometimes, however, a certain restriction in their selection. Where a specialist firm executed the work itself, it came within the category of a licensed contractor for that special contract.

The logical method would doubtless be for specialist firms to combine all three divisions, and supply design, execution, and materials, thus doing the whole work throughout themselves. But it was obviously impossible, under present conditions, for any single firm to keep up the enormous organisation which would be necessary to carry out contracts simultaneously in all parts of the country.

Each method of exploitation had its use and advantages, and the selection of method by the client would depend on circumstances and on local conditions. There was room in this country for all methods and systems, and no doubt in time these would settle down into specific grooves, so that certain classes of work would be carried out on certain lines, and some co-relation would be established between the various firms and systems which would apportion the work to the interests of all concerned.

Responsibilities.

It would be conceded as a general principle that responsibility should be confined to duties undertaken. It was illogical, for instance, to fasten responsibility of execution upon a specialist firm which was not afforded the opportunity of control and supervision of work. It was unfair to expect this firm to make good any mistakes in quantity of material which might arise in estimates; and yet this was continually occurring. The client, when ignorant of the method of construction he was about to adopt, naturally looked to the specialist firm for a guarantee. A refusal to accept this guarantee would frequently lose the work, because the client imagined that the firm had no confidence in its system. The real reason for refusal was that no provision was made for supervision, and, as so much depended upon the actual work upon the site, no specialist firm which valued its reputation would accept such responsibilities, unless it was in a position to supervise. Clearly responsibility in this case should be accepted by the contractor, but he would frequently refuse, under the impression that everything depended upon the system adopted; naturally, if he could avoid such liability he will do so. The ordinary responsibilities of a specialist firm should be limited to the design and to the quality of the reinforcing material, when the latter was supplied. When a full guarantee involving construction was exacted, the firm should stipulate for proper supervision and control over the contractor by one of its staff appointed as resident engineer, with suitable remuneration for such service. The ques-

---

[*] Abstract of paper read by Lucien Serraillier, at the third general meeting of the Concrete Institute, February 18th, 1909.

tion of responsibility, therefore, should be clearly defined at the outset of every contract, and those specialist firms which did not carry out contracts themselves should stand together in resisting the imposition of guarantee for work which they could not control, or otherwise any resulting disaster would affect the reputation of all.

In the case of firms which exploited (A) systems of construction, the responsibilities were, of course, more clearly indicated. The firm guaranteed its design and the licensed contractor guaranteed its execution. The reinforcing material being purchased by the contractor, the latter was responsible for it, but had the right of rejection. In this case the specialist firm occupied the place of the technical adviser, and risked its reputation like the latter, but not its pocket, except as regarded the guarantee of design pure and simple.

(To be concluded.)

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

The querist's name and address must always be given, not necessarily for publication.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

Such answers will be forwarded to the querists promptly on receipt from the respective experts, but the Editor will not be responsible for any delay that may arise. The fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies. Every effort is made to ensure correctness, but Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

The Editor expressly declines to be held responsible for any mistakes or inaccuracies that may occur, nor does he undertake to satisfy in every instance the querist's demand. The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Selling Presumed Quarrying Field.

YORKSHIRE.—PERPLEXED writes: "It is desired to offer for sale a field next to a famous quarry. It is presumed that the stone exists also beneath this field. What would be the basis of calculating a fair purchase price? Please advise generally."

The simplest plan for disposing of the field appears to be to place it in the hands of a local auctioneer, who is in the habit of dealing with landed estate in the neighbourhood; he will be able to estimate the value very nearly indeed, and will advise as to whether it should be offered for sale by auction or privately. He may also be able to say whether any advantage is likely to be derived from the expenditure of capital in opening up a face of rock ready for working (this is sometimes a very expensive business, depending greatly upon the amount of the "overburden" of earth to be moved, and the levels by which access may be obtained to the stone). Theoretically, the value of the land depends upon the thickness and depth of the stone, its value when quarried, cost of quarrying, marketing, etc., but practically it becomes a pure matter of bargain, and is often greatly influenced by purely local circumstances, and the area of other land which is also in the market. The usual terms of a lease are, briefly: (1) the payment of a surface (or "dead") rent of approximately double the agricultural value of the land; (2) the payment of a royalty on every ton of stone extracted from the quarry, this price being fixed in accordance with the quality of the stone and the cost of working it. I have known royalties ranging from sixpence to two shillings per cubic yard, one shilling being a not unusual figure. (3) A minimum rent is usually agreed upon, merging into the royalty, and sometimes the lessee is allowed in a subsequent year to recoup himself for any deficiency in a previous year, without further payment of royalty. (4) The term for which land is thus let is rarely for less than 21 years, and more generally the lease is for 60 years. As the tenure of the land in question is such that the granting of a lease may cripple the output, it certainly appears to be desirable that the foremost owner should either sell his interest outright, or work it either himself or by a syndicate in which he has a controlling interest. F.S.I.

Shingle and Seasand for Concrete.

LONDON, N.W.—A. J. H. writes: "Concrete composed of shingle and sea sand is largely used in certain localities. Would you consider the objections to it insuperable?"

The only objection to concrete made with sea sand, or even sea water, is that the salt effloresces on the surface for a time, but that passes of. The strength is slightly less for the first few months, if salt is used, but after, say, six months there is no difference in strength. Sea sand and shingle have the merit of being clean and sharp, and are excellent materials for concrete. They should, however, be screened and carefull graded so as to get a concrete of maximum density.

Rights of Lessee.

CORNWALL.—LESSEE writes: "A gentleman has acquired by purchase a leasehold estate of several acres. The term is of sufficient length to induce building, but the lease itself does not specify the land as building land, merely treating it as ordinary land, and reserves to the lessor all trees, saplings, and minerals. The present lessee now wishes to develop the land as a building estate by constructing a new road, and also with a frontage on to a private road over which he has a right-of-way. I shall be glad to know if the lessee can, without the consent of the freeholder:—(1) Construct the new road, carry away the necessary vegetable soil, and hand the road over to the urban district council. (2) Connect to a drain which has been laid in the private road. (3) Use for the new buildings the sand excavated from the site. (4) Remove the wood to make room for building sites. And can the district council (a) set back the frontage line beyond the existing line; (b) prevent building on the private road because there is not a 24ft. entrance; (c) demand that the front boundary line on the private road shall be 18ft. from the centre of the road? The local by-laws stipulate that new streets (more than 100ft. in length, which this is) shall be 36ft. wide. The council have also adopted the Public Health Act, 1907."

Questions of this sort are exceedingly difficult to answer satisfactorily without seeing the lease itself. The best course is to take them to a good solicitor and pay him for a proper opinion. At first sight, however, it seems to be tolerably clear that the lessee has no right whatever to deal with the land in the way suggested. This sort of thing could only be done properly by a freeholder. The lessee cannot construct the new road, use the sand excavated from the site, nor remove the wood to make room for building sites. With regard to question 2, however, he is at perfect liberty to connect any necessary drains to the sewer in the private road, provided that he arranges the matter with the local authority, and the owners of the recreation ground. So far as the district council is concerned (a) they would not be at liberty in the ordinary course to insist on the frontage line being set back any further; but (b) they could certainly prevent building on the private road on the ground mentioned; and also (c) they could demand that the front boundary of this road should be 18ft. from its centre. As said above, all these answers are subject to correction by a solicitor who could have all the facts placed in his hands, together with a copy of the local by-laws. INSTITUTE.

THE GUILD OF ARCHITECTS' ASSISTANTS.

The inaugural meeting of the proposed Guild of Architects' Assistants will be held at the Tudor Hotel (room 19), to-morrow, Thursday, February 25, when Mr. A. W. S. Cross, M.A., F.R.I.B.A., will take the chair at 8 p.m. Sympathisers with the movement, which has been previously outlined in our columns, are invited to be present.

Trade and Craft.

Fawcett's Mon'lithcrete Floor.

The "Mon'lithcrete" floor test of Saturday, February 13th, resulted in the floor developing extraordinary strength. As recorded in our last issue, the span was 16ft. and the rolled steel girders were two 6in. by 3in. by 3in. by 12lb. reduced to 7-3lb. per foot by cutting large rhomboidal shaped openings in the webs, leaving tension metal only between pitched at an angle of 45 degs. to the right and left of the centre, and leaving the webs solid at the ends to resist shear, and the top flanges had been reduced to 2in. These were placed at 1ft. 6in. centres, and buried in a slab of concrete 16ft. by 2ft. 6in. by 7½in. thick, this concrete being 1½in. below the bottom flanges, and flush with the top flanges. The concrete was composed of clean broken brick and tile and Portland cement gauged 6 and 1, and allowed five weeks for setting. The two reduced (7.3lbs. per foot) rolled steel girders were bound together by the concrete passing through the large rhomboidal shaped openings in the webs, and by twisted ¾in. by 1-16in. hoop steels, one in each opening buried about two-thirds down in the thickness of the concrete, but not bent over or connected to the girders in any way. As previously reported, the floor was loaded on Saturday, February 6th, with ballast to the breaking weight (16.8 tons) of two 6in. by 3in. by 3in. by 12lb. rolled steel girders without breaking, the deflection was barely 1in. It was allowed to stand until Saturday, February 13th, when the load was continued to 25.2 tons, or 50 per cent. over the breaking weight of two 6in. by 3in. by 3in. by 12lb. rolled steel girders, and it still stood; the box containing the ballast was by that time 13ft. 9in. high, and heaped up to its full capacity. The distributed load was 14 cwt. per foot super., and the maximum deflection was 2¼in. On Tuesday, February 16th, holes were cut in the sides of the box allowing the ballast to run out, and as this proceeded the floor lifted again, and the deflection on clearing all off was found to be 1⅜in. The value of wall holds for the rolled steel girders, return ends, and longer time for the concrete setting are not here taken into account.

Law Case.

Disputed Ownership of Slates: Difference Between English and Scottish Law.

At the High Court of Justice on Feb. 16th, Master Archibald heard the case of Hall and Company (Croydon), Ltd., v. E. F. Horn, in which the plaintiffs claimed the sum of £23 7s. 6d., being the price of certain slates alleged to have been sold to the defendant. —It appeared that originally the plaintiffs had agreed with certain builders to do the slating of a pair of houses in Manor Park, Lee, at a price of £14 per house, including all incidentals. The plaintiffs delivered a quantity of slates on the site, with a view to themselves doing the slating, but, before they were fixed, the defendant, who had been financing the said builders, took possession of the premises. On the plaintiffs attempting to remove the slates, the defendant objected, but signed a letter addressed to the plaintiffs, agreeing to pay for the slates if they did not belong to the said builders.—Mr. McCardie (instructed by Messrs. Braby and Macdonald, solicitors, who appeared for the plaintiffs, contended that the property in the slates had never

OFFICES, BEVERLEY. B. S. JACOBS. F.R.I.B.A., ARCHITECT.

UNIVERSITY OF ILLINOIS

passed away from the plaintiffs, as they had only agreed with the before-mentioned firm of builders to do the slating, and not to deliver any slates to them.—Mr. Benson (instructed by Messrs. Clifford and Co., solicitors) contended, however, that the slates were the property of the builders, for the following reasons:—The builders in question had a contract with the plaintiffs for doing the slating, and the benefit of this contract had now passed by virtue of the financing agreement to the defendant Horn by virtue of his having taken possession. As the plaintiffs had failed to do the slating for the builders, the assignee of the said builders was entitled to take the slates on the site, and carry out the work which, it was alleged, the plaintiffs had failed to do. A Scottish decision was quoted in support of this contention. Master Archibald decided that, under English law, the plaintiffs must succeed, as the slates had remained continuously vested in them. He added that it was possible that if the case had been tried under Scottish law, the decision might have been different. Judgment was therefore given for the plaintiffs for the amount claimed, and costs.

Our Plate.

East Riding County Council Offices.

The extension to these offices was carried out at a cost of a little over £7,500. The elevations are faced with best pressed thin red bricks, with cornices, architraves, columns, window dressings, etc., of stone from the Warwick quarries. The floors of halls and corridors are paved in Roman cube mosaic laid by Messrs. Diespeker and Co., of London, and the vestibule paved in black and white Roman marble. All floors are of fireproof construction. The large committee rooms are panelled throughout in mahogany to a height of 9ft. The contractors were Messrs. G. Longden and Sons, of Sheffield. The heating apparatus was fixed by the Leeds Marble Works, Leeds. The architect is Mr. B. S. Jacobs, F.R.I.B.A. of Hull.

LOCAL GOVERNMENT BOARD ENQUIRIES.

The Local Government Board has recently held inquiries into proposed expenditure by public bodies as follows:—Water supply works and plant:—Swansea R.D.C., £1,317 for Crockett (February 16th); Leyland U.D.C., £3,564 (February 17th); Bredbury and Romilly U.D.C., £2,814 (February 19th); Rhondda U.D.C., £2,000 (February 18th). Sewerage, drainage, and sewage disposal works and plant:—Evesham B.C., £700 (February 17th); Barnsley B.C., £200 (February 19th); Burslem B.C., £3,800 (February 17th); Croydon B.C., £21,850 (February 16th); Winchcomb R.D.C., £1,000 for Cleeve Hill (February 16th); Epping R.D.C., £4,830 for Roydon (February 16th); Plymouth B.C., £900 (February 12th); Brentwood U.D.C., £13,766, for Upminster and South Weald (February 17th). Street improvements, widenings, new roads, public walks, and pleasure grounds:—Stoke-upon-Trent B.C., £1,850 (February 16th); Hanley B.C., £1,100 (February 18th); Swansea B.C., £525 (February 17th); Monmouth C.C. and Cardiff City Council, £4,263 and £4,101 (February 19th). Various:—Saffron Walden B.C., £1,150 for public baths (February 19th); Padiham U.D.C., £1,500 for stables, etc. (February 18th); Edmonton U.D.C., £900 for public baths (February 17th); Stoke Newington B.C., £1,150 for public slipper baths (February 16th); Wolverhampton B.C., £10,200 for public baths (February 19th); Blackpool B.C., £3,050 for sea-water supply (February 16th); Leeds C.C., £1,320 for cement store (February 18th); Wigan B.C., £1,300 for motor fire engine and £1,150 for corporation baths (February 18th); Bradford C.C., £10,065 for Memorial Hall deficit (February 16th); Nelson B.C., £2,750 for gasworks, new mains, etc. (February 17th); Ilkley U.D.C. £5,700 for gasworks (Feb. 17).

Federation News.

BURTON-ON-TRENT ASSOCIATION.

Secretary: A. W. Chamberlain.

The annual general meeting of the Burton-on-Trent and District Building Trade Employers' Association was held at the Station Hotel, Burton-on-Trent, on Saturday, January 30th, Alderman Thomas E. Lowe, J.P., in the chair.

The Secretary read the annual report, in which the following matters of general interest were included:—

Six new members were admitted during the year, making the membership 36.

The Burton Branch of the Operative Stonemasons' Society have served a notice of new rules to come into operation in May next. Negotiations have been announced with the operatives with a view to the notice being withdrawn, as the committee think that, owing to the depression in trade, the present time is inopportune for making alterations to existing rules.

The collective scheme of insurance against workmen's liability has been well taken up by members during the year, and the balance-sheet of the Law Car and General Insurance Corporation (with whom the risk is placed) is highly satisfactory. There have been considerable claims on this account during the year, which have been met very satisfactorily by the corporation.

It was proposed by Alderman Lowe, and seconded by Mr. A. Maddocks, and resolved, that the secretary's report and financial statement be adopted and entered on the minutes.

The election of officers for the year 1909 was next proceeded with, and the following were unanimously elected:—President, Alderman T. E. Lowe, J.P.; vice-president, Mr. Henry Edwards; treasurer, Mr. Councillor Kennard; hon. auditors, Mr. T. W. Selby and Mr. Fred Hodges.

On the proposition of Mr. A. W. Chamberlain, seconded by Mr. Wood, a hearty vote of thanks was unanimously accorded the retiring officers for their services during the past year. It was proposed by Mr. H. Edwards, seconded by Mr. F. W. Platts, and resolved, that the following members constitute the Executive Council:—Bricklayers, Mr. W. Wood, Mr. A. B. Edwards; stonemasons, Mr. Hodges, Mr. Kershaw; joiners, Mr. A. Knight, Mr. H. Needham; plasterers, Mr. Biddulph, Mr. C. Mitten; painters, Mr. F. Lewis, Mr. F. Holmes. The following were unanimously appointed the Local Conciliation Board, to take office in May next:—Messrs. Geo. Kennard and C. Tomlinson, bricklayers; Messrs. Alderman Lowe and Geo. Hodges, stonemasons; Messrs. F. W. Selby and A. Knight, joiners. Mr. Geo. Hodges was unanimously appointed delegate from this association on the Midland Centre Executive Council.

It was resolved to hold the quarterly meetings as near to the following dates as possible:—February 16th, May 7th, September 10th, and November 5th.

After a vote of thanks had been accorded the chairman, the members proceeded to the annual dinner, which was attended by nearly fifty members and friends, Alderman T. E. Lowe, J.P., presiding. After the customary loyal toast, Mr. Teally, president of the Burton-on-Trent Master Painters' Association, proposed "The Burton-on-Trent and District Building Trade Employers' Association." He referred to the very kind way in which the Builders' Association had recently given their good offices to the local Painters' Association in adjusting their rules with the Operative Painters' Society. He coupled the name of Alderman T. E. Lowe with the toast. Alderman Lowe, in responding to the toast, pointed out the mutual benefits and advantages of association, and paid a warm tribute to the Conciliation Boards. Notwithstanding continuous depression in building, the Burton employers had not asked the operatives to accept a reduction in wages, and he felt confident, from the knowledge he had of the working of the local Conciliation Board, that the men would meet the employers in a fair spirit, and would not forget this considerate treatment of them during five years of bad trade. In the absence through illness of Mr. Geo. Hodges, the toast of "The National Federation" was proposed by Mr. A. W. Chamberlain, who spoke of the many benefits the local association gained by being affiliated to the National Federation. The National form of contract had been a great boon to the associated masters, and to the trade at large. Too much praise could not be given to the Employers' Parliamentary Council for the work they did for the employers of labour in watching all Bills which came before Parliament. He coupled with this toast the name of Mr. F. W. Amphlet, the secretary of the Midland Centre. Mr. Amphlet, who, on rising to respond, met with a very hearty reception, referred to the excellent work of the Parliamentary Council, and of the Conciliation Boards. From his own experience of the Midland Centre Board, he was confident that the Boards would be a great blessing to the trade, as they were the means of righting wrongs without resort to strikes. The toast of the visitors was proposed by Mr. Councillor Kennard, and responded to by Mr. H. Trafford Wynne (of Staton and Co., Tutbury). Mr. Albert Knight proposed the chairman's health, and Alderman Lowe having responded, the singing of "Auld Lang Syne" and the National Anthem brought a very happy gathering to a close.

CARDIFF ASSSOCIATION.

At the annual meeting of the Cardiff Association, held at the registered offices on Tuesday, February 2nd, the president, Mr. J. E. Turner, in the chair, the report of the committee for the year ending December 31st, was presented, viz.:—

The meetings of the National Federation held in London in January, 1908, and in Birmingham in July last, were duly attended by delegates of this association, and the association has also been represented at the quarterly meetings of the South Wales Federation.

A meeting of the Conciliation Board was held at Cardiff on May 25th last. Only one complaint against a member of the association has been made throughout the year, and this was withdrawn before the holding of the meeting at which it would have been considered.

Federation Journal.—Arrangements have been made with the proprietors of the "Builders' Journal" whereby that journal has become adopted as the official organ of the National Federation, and copies can now be obtained through the secretary at a special subscription. Only nine members have as yet availed themselves of this privilege, and it is hoped that during the current year every member will become a subscriber.

Prevention of Accidents in the Building Trade.—The Departmental report has been fully considered, and a letter has been forwarded to the Home Secretary in support of the suggestions made by Mr. George Macfarlane, which it was considered would result in making many of the proposed regulations more practicable.

Apprenticeship Deed.—At the request of the South Wales Federation we have prepared and submitted a form of apprenticeship deed, which has been adopted, and is now being printed for general use.

The association has also considered the question of extending the present schedule of prices for daywork and material, so as to cover measured work, but it was decided that the present schedule would meet all the needs of the members for some time to come, and as some of the prices may be altered in the near future, it was thought wise to defer altering the present schedule to some future date.

Cardiff Infirmary.—Sir Wm. Crossman Scheme.—With a view of assisting the Management Committee of the Infirmary, in their efforts to increase the funds of the Infirmary, a copy of the scheme has been forwarded to all the members, with a request that they should do all in their power to induce their workmen to adopt same. Up to the present half-a-dozen firms have intimated their intention to adopt the scheme.

Proposed Week's Holiday in August.—This subject is also being considered by the association, and the matter has been placed on the agenda of the South Wales Federation for consideration at the next meeting.

We are pleased to report that steps are being taken for the formation of a new association in Barry, and it is hoped that same will in the future become affiliated with the National and South Wales Federations.

Membership.—Several new firms were received as honorary members during the year.

A hearty vote of thanks to Mr. Turner for the very able manner in which he had conducted the affairs of the association during the past year was unanimously passed.

The election of officers for the current year was then proceeded with, and resulted as follows:—President, Mr. Wm. Thomas; vice-president, Mr. S. Shail; honorary treasurer, Mr. W. Symonds (re-elected); honorary auditor, Mr. G. Hallett (re-elected); committee, Messrs. J. E. Turner, S. Shepton, J. Allan, R. H. Bardo, C. C. Dunn, J. Gibson, G. Hallett, and W. T. Morgan.

WAKEFIELD ASSOCIATION.

Secretary: J. Beaumont.

A meeting of the members of the Wakefield and District Master Builders' Association was held at the Strafford Arms Hotel, Wakefield, on February 4th. Mr. Tom Lee (president) was in the chair. After the minutes of the last meeting had been read and confirmed on the motion of Mr. G. Crook, seconded by Mr. J. Pashley, the president referred in feeling terms to the death of Mrs. Saville, the wife of Mr. Joseph Saville, one of the honorary members of the association, and proposed a vote of sympathy and condolence with him in his bereavement. The resolution was seconded by Mr. E. A. Elvey and passed in silence by the members standing.
